Burgundy Pitch, a resinous substance prepared from common Frankincense (q.v.), the spontaneous exudation of the Norway spruce-fir (*Picea excelsa*, see FIR) by melting it in hot water, thus freeing it from a great part of its volatile oil, and straining. Burgundy pitch is of a yellowish-white colour, hard and brittle when cold, but softening by the heat of the hand, and readily adhering to the skin. It has a not unpleasant resinous odour, and when pure, no bitter taste. It is used in medicine as an external application only, and generally acts as a mild irritant. Although it used to be in great demand in medicine, it is not much used now. It enters also as an ingredient with resin, oils, &c. into a compound plaster of similar use. The Burgundy pitch of commerce is now principally brought from Finland, Austria, and Switzerland; but the greater

part of what is sold under that name is made by melting together pitch, rosin, and turpentine, and agitating with water, thereby imparting to it the necessary yellowish colour. This imitation may be distinguished from the genuine Burgundy pitch by its bitter taste, less agreeable odour, and by its not being soluble in twice its weight of glacial acetic acid.

Burgundy Wines are chiefly the produce of vineyards cultivated on the hilly lands forming the Côte-d'Or, and rank amongst the finest in the world. The wines of Upper Burgundy, and the wines of Lower Burgundy (Yonne), Macon, and Beaujolais, are other two groups of Burgundies. The finest of the *white* Burgundy is Mont Ratchet; Chablis is a *white* wine of Lower Burgundy. Beaune is the centre of the trade. The most celebrated of the *red* wines of Burgundy are Romanée-Conti, Chambertin, Richebourg, Clos-Vougeot.

Burhanpur, a town of India, in Nimar district, Central Provinces, on the north bank of the Tapti, 280 miles N.E. of Bombay, and 2 from the railway station of Lalbāgh. The remains of buildings show that the town extended over an area of 5 sq. m. when under the Moguls. Eight sets of aqueducts can still be traced. The city was taken by General Wellesley in 1803, but it was only in 1860 that Burhanpur came completely under control of the British government. The town contains a palace built by Akbar, and a mosque built by Aurangzeb. Although on the decline, there are still some manufactures of gold wire, cotton and muslin, silk, and brocade, for which the place was formerly notable. Pop. 23,000.

Burial, a word of Teutonic origin (O.E. *byrgan*, 'to bury'), is applied to the prevalent method among civilised nations of disposing of the dead by committing them to the earth. The general tendency of mankind has always been to bury the dead out of sight of the living; and various as the methods of accomplishing this end have been, they have resolved themselves into three great classifications: (1) The simple closing up of the body in earth or stone; (2) the burning of the body, and the entombing of the cinders; and (3) the embalming of the body. The first of these is the earliest form of which we have any knowledge. The palæolithic cave-dwellers of France and Belgium buried their dead in natural grottoes and crevices of the rocks similar to those in which they lived. The later stone-age people throughout Europe buried in chambered barrows and cairns. The bronze-age people buried in unchambered barrows, or in cemeteries of stone cists set in the ground, often in natural eminences of sand or gravel, or surrounded by circles of standing stones. Cremation was practised side by side with simple inhumation throughout the prehistoric period. It was also a general characteristic of burial in pagan times that the dead, whether cremated or not, were provided with grave-goods, such as urns or vessels of clay, bronze, gold, or glass, clothing and personal ornaments, implements, and weapons. Christianity abolished cremation, and restricted the provision of grave-goods to the burial of kings and priests, who continued to be interred in their royal and sacerdotal robes, and with their insignia of office. The stone cist became the stone-lined grave of the early Christian cemeteries, and the stone sarcophagus, which can be traced back to the time of the Egyptian kings who built the Pyramids, continued throughout the middle ages. In the first four centuries of the Christian era the Christians at Rome had buried their dead in the Catacombs, a series of 'subterranean excavations, consisting of long horizontal passages, with recesses on either side, arranged in tiers, for the reception of the

bodies, closed in by slabs bearing inscribed memorials and emblems of the faith. During the persecutions of the 2d century the Catacombs were used as places of assembly for worship; and the association of the church and the cemetery thus established has continued ever since. It was not till the 9th century, however, that the formal consecration of churchyards became customary. In Egypt, and perhaps also in Palestine, the Christian church inherited the practice of embalming, to which there is frequent allusion in the Scriptures. The Israelites may have learned the art from the Egyptians, among whom it was so extensively practised, that Egyptian corpses, as inoffensive as any article of wood or stone, are scattered over Europe in museums, and are even to be found as curiosities in private houses. The soil and climate of Upper Egypt seem to have afforded facilities for embalming unmatched in any other part of the world; and in other places the practice has been attributed to Egyptian influence. It is not unusual even yet to embalm royal corpses, and in some places to preserve a series of desiccated bodies, as in the vault of the monastery of Kreuzberg, at Bonn, where the monks have been successively preserved in their costume for centuries. Cremation is described in the Homeric poems as an honourable mode of sepulture practised in the heroic ages of Greece. The Romans, who in the time of the Republic had interred their dead, adopted the Grecian usage in the days of Sulla. It is mentioned in the Sagas as the older custom of the early Norsemen, who used occasionally to place the viking in his ship, and 'send him flaming out to sea,' instead of entombing him beneath the mound of earth, with all his belongings, in his vessel set on even keel, which was the more usual method. The Esthonians also practised cremation; and the custom was retained till the 10th century among the tribes along the Volga, along with the horrible accompaniment of human sacrifice in honour of the dead, as we learn from the narrative of Ahmed Ibn Fozlan, who states that he was an eye-witness of the whole ceremonies. It was prohibited among the conquered Saxons, under pain of death, by Charlemagne. It is still practised in India, but without the suttee, or burning of the living widow with the corpse of the husband. Until quite recently cremation was a common custom in Japan, and was practised side by side with unburned interment. The latter became the universal custom in Europe from the several dates of the introduction of Christianity into the different countries.

Some of the grandest buildings in the world have been tombs; such are the Pyramids, the castle of St Angelo, the tomb of Cæcilia Metella, and many temples in eastern countries. The notion that the dead may require the things they have been fond of in life has also preserved to the existing world many relics of the customs of past ages; the tombs of Egypt have supplied an immense quantity of them, which have taught the present age more of the manners of ancient nations than all the learned books that have been written. Herodotus tells us of favourite horses and slaves sacrificed at the holocaust of the dead chief. The same thing has been done in recent times in Ashanti.

Amongst the ancients an unburned or unburied body was held to be disgraced, and the spirit was unhappy till a kindly stranger at least threw a few handfuls of earth on the corpse. In the Christian countries, too, the denial of the rite of Christian burial involved a judgment on the life of the deceased; this sad fate was usually or frequently reserved for the unbaptised, including unbaptised infants, non-Catholics, excommunicated persons, notorious mockers at religion and evil livers, unrepentant sinners, persons who did not take the

Eucharist at least once a year, executed criminals, suicides, persons who fell in duels; and till the Revolution every French stage-player had to be content with burial in unconsecrated ground. Thus in 1730 the brilliant actress, Adrienne Lecouvreur, had for this reason alone to be buried in unconsecrated ground without the semblance of a religious rite, in spite of strong pressure brought to bear on the Archbishop of Paris.

In England, burial in some part of the parish churchyard is a common-law right, which may be enforced by mandamus—that is, every person may be buried in the parish where he dies. But the body of a parishioner cannot be interred in a metal coffin or vault, or even in any particular part of a churchyard, as, for instance, the family vault, without an additional fee. By the canons of the Church of England, clergymen cannot refuse or delay to bury any corpse that is brought to the church or churchyard; on the other hand, a conspiracy to prevent a burial is an indictable offence. It is a popular error that a creditor can arrest or detain the body of a deceased debtor; and the doing such an act is indictable as a misdemeanour. It is also an error that permitting a funeral procession to pass over private grounds creates a public right of way. By Acts of 1823, the inhabitants of any parish, township, or place, when going to or returning from attending funerals of persons in England who have died and are to be buried there, were exempted from any toll within these limits; and in 1824 the same regulation was extended to Scotland; the only difference being, that in the latter case the limitation of the district is described by the word *parish* alone. Not till 1823 was the barbarous mode of burying suicides at cross roads, with a stake driven through the body, abolished. It was then enacted that their burial should take place, without any marks of ignominy, privately in the parish churchyard, between the hours of nine and twelve at night, under the direction of the coroner. In Scotland, the right of burial in a churchyard is an incident of property in the parish; or of residence or death within its bounds, the *solum* or ground being dedicated to the use of all persons so entitled to burial. Registration (q.v.) of death should precede burial. The solemn rites of burial at sea are regulated by the necessities of the case. Usually the dead body is sewn up in a hammock, with a weight attached to the feet, and a modified form of the English burial service is read before the body is committed to the deep.

At various times, and in various places, there has been much popular excitement as to the possibility or probability of persons being buried in a state of suspended animation, but still really alive. Few of the many stories of cases of this kind have been authenticated; if any such occurs, it must be the result of inexcusable haste and carelessness. A competent medical man can easily decide by auscultation whether the heart has ceased to beat. (For the other signs of death, see DEATH, CATALEPSY.) In some places the dead are kept for a time in mortuary houses specially fitted up for the purpose—a bell-pull being attached to the extremities of the corpse, so as to give a summons on the smallest motion of the body. But these precautions have always proved needless; a corpse has never revived under such circumstances.

In Christian countries, if the remains of the saint to whom a church was dedicated could be obtained, they were buried near the altar in the choir. It became a prevalent desire to be buried near these saints, and the bodies of men eminent for their piety, or high in rank, came thus to be buried in churches. It can scarcely be said that a practice so detrimental to the public health as the burial

within churches, was checked in this country until the whole system of intiamural interment, including the practice of pit burial, as it was called, was attacked by Southwood Smith, Walker, Chadwick, and other sanitary reformers. Measures were afterwards carried for shutting graveyards in crowded cities, and placing interments in open cemeteries under sanitary control. The first great measure was passed in 1850, when the Board of Health was made a Burial Board for the metropolis, and power was given to the Privy-council to close the city graveyards. The act was extended to the English provinces in 1853, and to Scotland in 1855, and has been repeatedly amended.

The main features of burial legislation are these: The Privy-council may, on the representation of the Home Secretary, order the discontinuance of burial in any graveyard, and may interfere to prevent any vault or place of burial becoming dangerous to health. They may also regulate burials in cemeteries established under statute. Licenses may be got for the continued use of private vaults and graves. The Privy-council may also require the vestry in an English parish to meet and consider whether a new burial-ground shall be provided. If they proceed, a burial board of from three to nine persons is appointed by the vestry. Town-councils in boroughs, and local boards of health, may be constituted burial boards by order in council. Parishes may combine for this purpose, and the burial-ground need not be within the parish. It must not be within 100 yards of any dwelling-house, without the consent of the owner in writing. Part of the burial-ground must be consecrated, part unconsecrated; but the fees, which are subject to public control, must be the same in both parts. The boards are authorised to arrange for the conveyance of the dead, and to provide reception-houses. They are also bound to keep accurate registers of interments. Any expenses beyond receipts are charged on the poor-rate. In 1872 very valuable suggestions for providing and managing burial-grounds were issued by the Home Secretary. These deal with situation, soil and drainage, paths, fencing and planting, size of grave spaces (which should be 9 feet by 4 feet, or 4 square yards, with a depth of from 4 to 6 feet), reopening of graves, which is permitted after 14 years, &c. The controlling authority in such matters in England as in Scotland is the Parish Council. The burial boards in England have expended millions on cemeteries; thousands of churchyards have been closed. There is also a very large number of cemeteries conducted by companies for profit. The administrative arrangements in Scotland are very similar; the ratepayers are entitled to raise the question of closing an old, or providing a new burial-ground by petition before the sheriff. (For Disinterment, see POST-MORTEM EXAMINATION, RESURRECTIONISTS.)

In the United States, neglect to bury a dead body by any one whose duty it is to bury it, and having sufficient means to do so, is a misdemeanour. It is also a misdemeanour to fail to notify a coroner that a body on which an inquest ought to be held is lying unburied, or to bury or otherwise dispose of such body without giving notice to the coroner.

For other matters connected with the subject of burial, see CEMETERIES, CHURCHYARDS; CREMATION, EMBALMING; TOMB, COFFIN, CATACOMBS, BARROWS, CAIRNS, PARISH, PYRAMIDS, STONE AGE, TOPE; FUNERAL CUSTOMS.

Burial Societies are friendly societies, with the express object of supplying (by means of small periodical contributions) a fund for paying the funeral expenses of members. In addition, many friendly societies, benevolent societies, and industrial insurance companies include among their main

purposes insurance of funeral expenses of members and their nearest relatives. The proceedings of the criminal courts having shown that in some instances children on whose lives such an insurance was effected had been killed or allowed to die of neglect, and that children were frequently insured in more than one society, various precautions were enforced under the Friendly Societies Act. The insurance on the death of a member's wife, widow, or child over ten years of age, under cover of funeral expenses, of sums obviously exceeding the probable cost of the funeral was made illegal; and the payment of money on the death of children under ten has been made subject to special limitations and conditions—viz. no one or more societies or branches can insure or pay, (a) on the death of a child under five, more than £6 in all; (b) on the death of a child over five but under ten, more than £10 in all. Such sums are payable only to the parent or his personal representative (executor or administrator), payment to a guardian or other relative not being valid. A specially-filled-in death certificate must be produced. These restrictions apply to both registered and unregistered friendly societies, benevolent societies, and industrial assurance companies; and such insurance by other bodies is illegal. See FRIENDLY SOCIETIES, INSURANCE, REGISTRATION.

Buriats, a Mongol race, with several branches, in east Siberia, on both sides of Lake Baikal, numbering about 207,000. The Moscow Soviet government conceded autonomy to the prevaillingly Buriat region west of Lake Baikal (southern Irkutsk), that to the east falling within the Far Eastern Republic. The Buriats are a peace-loving but slothful and discourteous people, prone to petty thefts, and passionately fond of drink. Though some have become good farmers, the majority are nomads, breeding cattle, or living by hunting and fishing. Some of the tribesmen have of late years, however, studied with success several branches of science; and the blankets, leather, and metal-work of the people are known throughout Siberia. Those dwelling west of the lake have conformed to the Greek Church, and the others have adopted Buddhism; but of most, Shamanism (q.v.) is still the actual religion. Under Russian rule since 1644, they yet preserve among themselves a patriarchal form of government. There is a Grammar and Vocabulary by Castren and Schiefner (St Petersburg, 1857) of their language; and a Grammar by Orloff (1878).

Buridan, JEAN, a French schoolman of the 14th century, born at Béthune, in Artois, about 1300, studied at Paris under Occam, became himself a teacher of the nominalist philosophy, and was rector of the university of Paris in 1327. Of his life almost nothing is known, but it is certain that he was alive as late as 1358. There is a tradition that he had to flee from France, and that at Vienna he helped to found the university, but this is contrary to historical fact. His works treat of logic, metaphysics, physics, ethics, and politics—almost every subject save theology, which he avoided because it does not rest on reason alone, the sole authority in philosophy. Like Occam, he denied objective reality to universals, which are mere words, singulars or individuals alone existing (see NOMINALISM). In his comments on the *Nicomachean Ethics* of Aristotle he makes the will depend entirely on motives, the only freedom being a certain power of suspending the judgment and determining the direction of the intellect. The celebrated sophism known to the schoolmen under the name of Buridan's Ass, has been discussed at superfluous length, and with needless ingenuity, by Bayle. It occurs nowhere in his

books, and was no doubt due to some opponent who wished to cast ridicule upon his determinism. The sophism referred to is, that if a hungry ass be placed exactly between two bundles of hay of equal size and attractiveness, it must starve, as there is nothing to determine the will of the animal towards either bundle. (This hypothetical case is, however, found in Aristotle, *De Caelo*, ii. 14, and in the fourth book of Dante's *Paradiso*.) His chief works are *Summulae de Dialectica* (1487), *Compendium Logicae* (1489), *In Aristotelis Metaphysica* (1518), and *Questiones in x. libros Ethicorum Aristotelis* (1489).

Burin, or GRAVER (Fr. *burin*, from Ital. *borino*; but originally cognate with English *bore*), the principal instrument used in copper-engraving, is made of tempered steel, and is of prismatic form, the graving end being ground off obliquely to a sharp point. The distinctive style of a master is frequently described by such expressions as a *soft burin*, a *graphic burin*, or a *brilliant burin*.

Burino. See CHIZEROTS.

Buriti Palm (*Mauritia vinifera*), a beautiful palm which grows in great abundance in the swamps of Northern Brazil, particularly on the Orinoco. It is one of the loftiest of palms, reaching 100 feet. The stem yields a kind of sago, which is cut in slices and eaten like bread; the pulp and seed of the sago-like fruit are eaten and made into sweetmeats—and the abundant sweet sap before flowering is drunk fresh, or is easily fermented into palm wine by the natives. Humboldt describes how the Guarani people at the mouth of the Orinoco not only derive their food from the tree, but make their nets, mats, hats, &c. from its fibres and leaves, and yet more literally live upon the tree, by suspending huts of its matting from stem to stem during the rainy season, annually returning to this arboreal existence. *M. flexuosa*, the Moriti or Sea Palm of Trinidad and Brazil, is of similar appearance and uses; but its leaves yield better fibre, and its stem a useful wood.

Burke, EDMUND, a celebrated orator and philosophic politician, was born in 1729 at Dublin, where his father had an extensive practice as an attorney. In 1741 Burke was sent to school at Ballitore, in the county of Kildare, and in 1743 entered Trinity College, Dublin. His undergraduate course was not marked by the ordinary distinctions, and he mainly devoted himself to a very extensive and desultory course of reading. Cicero was his favourite author. In 1748 he graduated B.A. Being destined for the English bar, he proceeded to London in 1750 to keep his terms at the Middle Temple. He never took kindly, however, to legal studies, and ultimately abandoned the idea of becoming a barrister.

The period from 1750 to 1760 in the life of Burke was a time of obscurity, spent chiefly in literary work, which in time brought him a considerable reputation. His first important publication was the celebrated *Vindication of Natural Society*, written in imitation of the style and ridicule of the reasoning of Lord Bolingbroke, in which, with well-concealed irony, he confutes Bolingbroke's views of society by a *reductio ad absurdum*. It was published anonymously in 1756, when its author was twenty-seven; with many of its readers it passed as a serious work. Soon after, in the same year, appeared his well-known essay, *A Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*—a treatise which attracted considerable attention both in this country and in Germany, and which, though crude, contains much able and independent thinking (see AESTHETICS). The same year Burke made a happy marriage with the daughter of a Bath physician, Dr Nugent.

In 1759 the first volume of the *Annual Register* appeared, a work which Burke originated, and to which he contributed largely till 1788. These writings of Burke not only introduced him to society, but opened up a wider field of activity. In 1761 Mr W. G. Hamilton ('Single-speech Hamilton'), then Secretary for Ireland, having appointed him his private secretary, he returned to Dublin, where he spent about two years, and received a pension on the Irish establishment of £300. In return for this favour Hamilton claimed that Burke should thenceforward devote his whole time to his special service, with the result that they had a violent quarrel, and Burke threw up his pension.

On his return to London he became a member of the Literary Club, the history of which is associated with almost every considerable name in the literature of the period. But literary society did not draw his attention from the chances of a political career. In 1765 he became private secretary to the Marquis of Rockingham, at that time premier, and in the same year was returned to parliament as member for Wendover. He obtained the seat through the influence of Lord Verney. His eloquence at once gained him a high position in the Whig party, and in the House of Commons. The Rockingham administration, however, lived only about a year, and with it terminated his second political employment. Though he held no office till the downfall of the North ministry in 1782, the public activity of Burke never ceased till his death. His eloquence, political knowledge, and force of character gave him a foremost place among the statesmen of the time.

The times were, indeed, unfavourable for a *new man*, who had only his natural genius to rely on for advancement, and whose strong convictions unfitted him to be an instrument of mere court or party interests. At that time there were two great forces in English politics, the court and the territorial aristocracy. With the accession of George III., the court had reasserted itself, and by an unsparing use of the public money in influencing elections, had gathered round it a powerful party. George III. found a willing servant in Lord North, whose long administration from 1770 till 1782 was marked by the unsuccessful coercion of the American colonies, by corruption, extravagance, and a prevailing reaction. Against this policy Burke and his Whig friends could only raise a strong protest. The best of Burke's writings and speeches belong to this period, and may be described as a defence and exposition of sound constitutional statesmanship against prevailing abuse and misgovernment. His first great pamphlet was *Observations on the Present State of the Nation*, a reply to George Grenville, written in 1769. In 1770 he published another great political pamphlet *On the Causes of the Present Discontents*, which treats of the many questions arising out of Wilkes' controversy, and the attitude of the court. Three great writings on the American struggle are perhaps the finest of his many efforts. These are the speech on *American Taxation* (1774), the speech on *Conciliation with America* (1775), and the *Letter to the Sheriffs of Bristol* (1777). In all three Burke is the advocate, with reference to the colonies, of wise and liberal measures, which would have averted all the mischief that ensued. In 1774 Burke had to retire from his seat for Wendover, but the important constituency of Bristol elected him as its representative. His Bristol seat he lost through loyalty to his political convictions. He claimed the right not to be a mere delegate, but the reasoning and independent representative of his constituents. When proposals were made for relaxing the restrictions on the trade of Ireland with Great Britain, and for alleviating the laws against Catholics, he

supported them in opposition to the wish of his Bristol constituents. With regard to Ireland generally, he showed a knowledge of her affairs, and a sympathy with her people, worthy of the best statesmanship. He had a kindly and reverent feeling for Catholicism; his mother and wife had been brought up in that faith, and he always advocated a broad and liberal policy towards its members.

The enlightened views of Burke were not pleasing to the majority of his Bristol constituents. He lost the seat in 1780, and from that time till 1794 he represented Malton. When the disasters and difficulties arising out of the American war had at last brought Lord North's government to a close, Burke's patron, Lord Rockingham, was called to office in 1782. Under him Burke held the post of Paymaster of the Forces, and he resumed it under the coalition government headed by the Duke of Portland in 1783. His tenure of office on each occasion was for only a few months; and the emoluments were reduced to £4000 a year in accordance with the principles laid down by himself in his *Plan for Economical Reform*.

After the fall of the Whig ministry in 1783 Burke was never again in office, and he was so far misled by party feeling that he opposed Pitt's measure for Free Trade with Ireland and the Commercial Treaty with France. In 1788 he opened the trial of Warren Hastings by the celebrated speech which will always rank among the masterpieces of English eloquence. Till his death the energies of Burke were now practically absorbed by the French Revolution. Loving 'liberty only in the guise of order,' he had from the beginning regarded the proceedings of the Revolution with suspicion. In 1778, during a visit to Paris, he had learned to dread the new opinions current amongst the leaders of French thought, and the excesses which soon marked the progress of the revolutionary movement made him tremble for social order. In 1790 he appeared as the champion of the old state of things in Europe by the publication of his famous *Reflections on the French Revolution*. This book had an influence far beyond that of any other writing of Burke. In less than a year it reached its eleventh edition. It was read all over Europe, and tended powerfully to encourage its rulers in a strenuous resistance to the Revolution. In the subsequent career of Burke, his attitude to the Revolution had a decisive influence, alienating him from Fox and many of his other Whig associates, but giving him a position of credit and honour in the political world, and especially with the reactionary portion of it, which he never enjoyed before. As time went on, Burke became more and more vehement in his denunciations of the French innovations, till he became incapable of expressing a calm and rational judgment about them. Most of his subsequent writings, the *Appeal from the New to the Old Whigs*, *Thoughts on French Affairs*, and *Letters on a Regicide Peace*, are marred by the passion with which he urges the government not only to fight the Revolution but to suppress free opinions at home. Burke died 9th July 1797. He was buried in the little church at Beaconsfield, where in 1768 he had purchased the estate of Gregories. During his whole political life Burke's private affairs were sadly embarrassed. He had to borrow money to buy his estate, and he was always deeply in debt. He had considerable pensions granted him in 1794. A proposal to raise him to the peerage under the title of Lord Beaconsfield on his retirement from the House of Commons in that year, was arrested by the death of his only son.

Burke ranks as one of the foremost orators and political thinkers of England. He had vast knowledge of affairs, a glowing imagination which kindled everything he touched, a wide and passion-

ate sympathy with the most remote and unfamiliar conditions of life as shown in his great speeches on India, and an inexhaustible wealth of powerful and cultured expression. His manner and delivery as a speaker, however, was unattractive and even awkward and ungainly. Speeches which captivated the reader only served to empty the benches of the House of Commons. Generally, and especially in his earlier days, he was on the side of an orderly freedom and a well-considered progress; yet it should be remembered that party feeling led him to oppose some of the wisest and most liberal measures of the younger Pitt, and that the fiery vehemence of his utterances on the French Revolution did much to let loose the passions which made Europe a scene of war for three and twenty years. His views were lucid, comprehensive, and philosophic. Society he regarded as a stable and orderly system moved by large historic influences; but in his passionate reverence for ancient order, he greatly exaggerated the value of things as they were. The irritable and untractable temperament which grew upon him during his later years, together with his circumstances as a *new man* handicapped by social prejudice, prevented him from attaining a worthy position in the ministries of the time. Yet in the application to politics of vast knowledge, high moral principle, great intellectual power, and rich and noble gifts of expression, he still stands unrivalled among English statesmen and orators. Sir Walter Raleigh holds that Burke's range of thought and language is wider than that of any other English prose-writer; the 'Letter to a Noble Lord' being perhaps the greatest example of his rhetoric and eloquence.

Editions of his collected works were published in 1792-1827 and 1832 (8 vols.), of his letters (3 vols.) in 1844, and of his Irish writings by Matthew Arnold (in 1881). There are Lives by Prior (1827), Crole (1840), Macknight (1853), as well as by Lord Morley (1867 and, in the 'Men of Letters,' 1879). And see Dilke's *Papers of a Critic*, Locky's *England in the 18th Century*, Lord Holland's *Further Memoirs of the Whig Party* (1905), and John MacCunn's *Political Philosophy of Burke* (1913).

Burke, SIR JOHN BERNARD, herald and genealogist, the son of John Burke (1787-1848), representative of a Tipperary family, who settled in London as a literary man, and in 1826 published the *Peerage and Baronetage of the United Kingdom*. The son, born in London in 1815, and educated at Caen in Normandy, was trained as a lawyer, and called to the bar in 1839. In 1853 he was appointed Ulster King-of-arms, was knighted in 1854, became LL.D. of Dublin in 1867, C.B. in 1868, and in 1855 keeper of state papers in Ireland. He died 13th December 1892. Besides editing the successive issues of the *Peerage* founded by his father, he published other works on *Landed Gentry* (1846), *Extinct Peerages* (1846), *Anecdotes of the Aristocracy* (1849), *Family Romance* (1853), *The Vicissitudes of Great Families* (1859), *The Rise of Great Families* (1873), and *Reminiscences* (1882).

Burke, ROBERT O'HARA, one of the first white men to cross the Australian continent from south to north, was born at St Cleram, County Galway, in 1820, was educated in Belgium, served in the Austrian army (1840), became captain, joined the Irish constabulary (1848), and emigrated to Australia in 1853. While inspector of police in Victoria he accepted the leadership of an expedition for crossing the Australian continent. After many hardships, Burke and Wills reached the tidal waters of the Flinders River. Burke died of starvation on his return journey, 28th June 1861. An expedition brought his remains and Wills's to Melbourne; and statues have been erected to their memory; but their incompetence is recognised.

Burke, WILLIAM, born in 1792, the partner with William Hare in a series of infamous murders. Both Irishmen and labourers, the latter started a lodging-house in a West Port close, Edinburgh, to which Burke came to live in 1827. Towards the close of that year they sold for dissection to Dr Robert Knox, instead of burying it, the body of an old pensioner who had died in the house, and the ease and safety with which they had earned this money tempted them to commit a series of murders to procure more bodies. Their plan was to inveigle unknown travellers into the lodging-house, make them drunk, and then suffocate them in such a way that the bodies showed no marks of violence. With the help of their wives they had already murdered fifteen persons, and received from Dr Knox for their bodies sums of money varying from £8 to £14, when their infamous trade was discovered by the police, aroused by the suspicions of the neighbours. Hare, the more execrable wretch of the two, was admitted king's evidence, and after his release found shelter in a nameless obscurity; while Burke was hanged, amid the execrations of the crowd, 28th January 1829. His abhorred name has added a word to the English tongue.

Burkitt, WILLIAM, commentator, was born at Hitcham, Suffolk, in 1650. He was educated at Stowmarket, and Pembroke Hall, Cambridge, and must have been ordained at a very early age, as in 1672 he was curate, afterwards rector, at Mildenhall, in Suffolk. In 1692 he was preferred to the vicarage of Dedham, in Essex, and here he died in 1703. Burkitt's sermons were soon forgotten; his *Notes* on the four Evangelists, and his *Expository Notes* on the New Testament, were long popular. The last was a meritorious compilation, although as Doddridge said, the 'sentiments vary in different parts of the work, as the authors from whom he took his materials were orthodox or not.'

Burleigh. See BURGHLEY, and BALFOUR (JOHN).

Burlesque (through Fr. from Ital. *burla*, 'a jest'), denoting a style of speaking, acting, writing, drawing, is a low and rude grade of the comic. The legitimate comic brings together contrasts with a final view to harmonising and reconciling them; the burlesque distorts and caricatures, and brings the incongruities into stronger relief. The farce is the burlesque of comedy. Deformities and monstrosities that excite disgust do not belong to the burlesque. The lofty and the abject, the great and the little are conjoined, with the sole view of exciting a laugh. Nor does the true burlesque turn real greatness and nobility into laughter, but only sham greatness—false pathos, and all hollow pretension and affectation. There is pure burlesque in Aristophanes, but the modern burlesque in sustained form may be said to have originated among the Italians, more particularly with the poet Berni. The genuinely national *buffone* of the Italians personates the burlesque. Carlo Gozzi, in his *tragi-comedies*, is perhaps the greatest in this vein. Some of the more remarkable burlesques in English literature are Chaucer's *Rime of Sir Thopas*, a burlesque of the long-winded and interminable stories of the middle ages; Beaumont and Fletcher's *Knight of the Burning Pestle*, on the imitations of the tales of chivalry; and the Duke of Buckingham's play, *The Rehearsal*, intended to ridicule the heroic language in contemporary plays. There are no happier examples in English than some of *The Rejected Addresses*. Butler's *Hudibras* has much of the burlesque in it, but it is a book that stands quite by itself. Similarly, *Don Quixote* contains burlesque elements enough, while it is one of the greatest and wisest books in the world. Parody (q.v.) or Travesty is a species of

burlesque. See *Burlesque Plays and Poems* in Moiley's 'Universal Library' (1887), and W. D. Adams's *Book of Burlesques* (1891).

Burlingame, ANSON, American diplomatist, born in 1820 at New Berlin, New York, was educated at Harvard, and after settling as a lawyer at Boston, became a prominent member of the Free-soil party. Elected to the Massachusetts senate in 1853, he entered congress in 1854. He was sent as United States minister to China by President Lincoln; and when, in 1867, he was returning home, the regent, Prince Kung, made him special Chinese envoy to the United States and the great powers of Europe. As such he succeeded (1868) in securing the acceptance and ratification by the United States and China of the Burlingame treaty, by which China officially accepted the principles of international law. He subsequently visited England, France, Denmark, Sweden, Holland, Prussia, and Russia as Chinese envoy, and died at St Petersburg, 23d February 1870.

Burlington, the name of three cities in the United States: (1) The capital of Des Moines county, Iowa, on the right bank of the Mississippi (here crossed by a railway bridge), 207 miles WSW. of Chicago by rail. It occupies a natural amphitheatre formed by the limestone bluffs which slope backward from the river, and is an important centre. Laid out in 1834, it is the seat of a Baptist college, and has manufactures of machinery, farming implements, flour, carriages, &c. Pop. (1870) 14,930; (1920) 24,057.—(2) A port of entry of Burlington county, New Jersey, on the Delaware, 20 miles above Philadelphia, with which, as well as with New York it is connected by rail. It possesses an Episcopalian college (1846), and large manufactures of shoes, ironware, thread, &c. Pop. 9000.—(3) A port of entry and capital of Chittenden county, Vermont, and the most populous city in the state, beautifully situated on the eastern shore of Lake Champlain, 40 miles WNW. of Montpelier by rail. It has a good harbour, with a breakwater and lighthouse, and has access by canals and the Richelieu River to the Hudson and St Lawrence, besides railway communication with all parts of the United States and Canada. It is the seat of the State Agricultural College (1865), and of the Vermont University (1800), which crowns the slope on which the city stands. It has cotton, flour, and planing mills, machine-shops, and manufactures of furniture, &c., and is one of the largest lumber markets in the United States. Pop. (1870) 14,387; (1880) 11,365; (1890) 14,590; (1920) 22,779.

Burlington. See BRIDLINGTON.

Burma, called *Myammd* or *Bamā* by the Burmese, the largest province in the British Indian Empire, has a total area of 238,738 sq. m., of which the central portion forming Burma proper occupies 168,573 sq. m., the Chin Hills to the west 10,250 sq. m., and the Shan States to the east 59,915 sq. m. It marches with Siam, French Indo-China, and China on the east; Tibet and Assam on the north; Assam, Manipur, and Chittagong on the north-west; and the Bay of Bengal and the Indian Ocean on the west and south-west, its seaboard having a length of about 1200 miles. Its extreme length is about 1200 miles, from 10° to 28° north lat., and its greatest breadth 575 miles at about 21° lat. (from the Mekong River to the Bay of Bengal); but the southern portion (Tenasserim), from about 17½° southwards, is a narrow seaboard strip. The north-western seaboard, Arakan, stretching from Cape Negrais to the borders of Bengal, forms also a narrow maritime tract, separated from Burma proper by the Arakan Yoma Hills. The main central portion, Burma proper, consists mainly of

the drainage-area of the Irrawaddy, the Sittang, and the Salween. Lower Burma (annexed 1852) was separated from Upper Burma (taken in 1886) merely by a line of pillars.

In Burma the hill-ranges lie mainly north and south, and the large rivers run mostly in the same direction. The chief hill-ranges are the Arakan Yoma, rising to 10,000 feet (Liklang), forming the western watershed of the Irrawaddy; the Chin and Naga Hills and the Kumon range, to the west of the Upper Irrawaddy; the Kachin, Shan, and Karen Hills, extending eastwards from the Irrawaddy valley into China, then trending southward as a narrow range forming the eastern watershed of the Salween, and separating Tenasserim from Siam. The highest hills are in the eastern Kachin range, where two peaks (Sabu and Worang) on the watershed between the Irrawaddy and the Salween rise to about 11,200 feet above sea-level; while in the Ruby Mines district, a little to the south of that, several peaks rise above 7000 feet. The Pegu Yoma, forming the watershed between the Irrawaddy and the Sittang, nowhere attains any considerable height; though the Panngaung range, between the Sittang and the Salween, has several peaks over 5000 feet high. But one of the most interesting hills is Popa, in the Myingyan district, near the geographical centre of Burma, an extinct volcano rising from the plains to a height of about 5000 feet. A conspicuous landmark, it is an object of superstitious veneration in local folklore. The Shan States, to the east of Central Burma, consist of a plateau, with an elevation of 2000 to 4000 feet, but cleft by deep limestone gorges and chasms walling in the Salween and its tributaries.

The chief river is the Irrawaddy, formed by the junction, at about 25½° north lat., of the Mali and N'mai rivers, whose unknown sources are probably in the snow-covered mountains of Tibet. Its chief tributary, the Chindwin, rising in the Chin and Naga Hills, is much larger than any of the other rivers having their drainage-area entirely in Burma, such as the Koladan in Arakan, the Sittang in Lower Burma, and the Tenasserim in Tenasserim. Though the Salween is longer than the Irrawaddy, it is of far less importance, as it mostly flows through rocky gorges, and is navigable for steam-launches only for about 80 miles from Moulmein, on the Gulf of Martaban. The Irrawaddy is navigable throughout the year up to Mandalay (650 miles) by large steamers, with two flats or cargo-barges attached, and by smaller steamers up to Bhamo, 900 miles from Rangoon and within 50 miles of the Chinese frontier; while during the rainy season steamers can ascend to the confluence of the Mali and N'mai, about 150 miles north of Bhamo. Of its main tributaries, the Chindwin is navigable for steamers for 300 miles above its junction; the Mogaung, Shweli, and Myit-guè are only partially open for steam-launches for about four months of the year. All the rivers are in high flood during the rainy season, but most of them subside in the dry weather. But the great delta of the Irrawaddy, extending from Rangoon to Cape Negrais, is always open to steamers and large country boats proceeding along the navigable creeks, aggregating some hundreds of miles in length. Until the introduction of railways, from 1877 onwards, inland transport of produce was, except on the Irrawaddy itself, mainly confined to the rainy season (May to November). Country boats carry up to about 120 tons.

The Koladan, Irrawaddy, Sittang, and Salween rivers all form broad fertile plains, and have rich deltas near the sea; though the total area of flat alluvial land hardly amounts to 50,000 sq. m., or between one-fourth and one-fifth of the total area

of Burma. But most of the rivers flood their banks in the wet summer season, and the Lower Irrawaddy and the Sittang inundate hundreds of square miles, except when prevented by earthen bunds from doing so. At Promé, 200 miles from the sea, there is a difference of 45 feet between the highest and lowest annual levels of the Irrawaddy; and where the open plains adjoining the delta begin, about 40 miles below that, the flood waters inundate the villages and submerge the low-lying lands for about 10 or 12 miles on either side of the river channel. But as the houses are built on wooden piles and the flow is not rapid, the villages are not destroyed, though the plough-cattle suffer greatly. Yet there are few large lakes in Burma. The three largest are the Indawgyi (Myitkyina district; area about 100 sq. m.), the Indaw (Katha; 60 sq. m.), and the Inle (Yaukhwe Shan State).

Climate and Rainfall.—Throughout Lower Burma and in parts of Upper Burma heavy rainfall renders the climate moist and depressing for nearly half the year, and more trying for the European than is the climate of the plains of India; and owing to the swarms of mosquitoes, malarial fever is prevalent. Along the seacoast the average rainfall varies from 100 to 250 inches a year, and at Rangoon and in the delta it is about 90 to 100 inches, though much higher farther inland at Shwegyin on the Sittang; but as one ascends the Irrawaddy towards the centre of Burma, it rapidly decreases to about 45 inches at Promé and 40 inches at Thayetmyo, until a dry central zone is reached, extending across the country from 20° to 23° lat., where the rainfall is usually only from 20 to 30 inches a year, and where scarcity sometimes occurs through want of water, unless irrigation be provided. Beyond this the rainfall again increases, to about 60 inches at Katha, 80 to 90 inches at Bhamo, and more at Myitkyina. Thus parts near the seacoast or the densely wooded hilly tracts in the north have not only the greatest rainfall, but also the lowest temperature during the south-west or summer monsoon season (May to October). The north-east or winter monsoon only slightly affects the northern districts near Bhamo. The temperature varies as much as the rainfall. There are three seasons fairly well defined throughout most of the province—the cold weather, from November till February; the hot weather, from March to May; and the rains, from May or June to October and November. In Lower Burma, north of Rangoon, the thermometer ranges from about 54° during the night (in the forests) up to over 100° in the shade; but farther north, towards the central dry zone, the climate shows greater extremes of cold and heat, though the coldest nights are experienced in the districts lying to the north of the tropic of Cancer. Some Europeans prefer the damp equable climate of Lower Burma to the drier climate of Upper Burma with its dust and greater extremes of heat and cold, and greater differences between day and night. December, January, and February are pleasant months throughout the province; and even in the hot weather the nights are usually comparatively cool in Lower Burma. But during the rains, when the air there is saturated with moisture and a temperature of 87° is trying, the greater warmth of the dry zone is more easily borne, and is mitigated by a strong wind blowing continuously night and day from the south during July and August. At Maymyo, the summer headquarters of government, near the edge of the Shan plateau and about 35 miles east of Mandalay, frost is usual at night in December and January, and the hottest time is about the end of March, when the thermometer rises to 92° or 93°; but on rain then falling, the temperature falls, and seldom rises to 87° during the summer. Several small hill-

stations have been opened out, mostly on the hills to the east of the Irrawaddy.

Geology and Mineralogy.—The geological features of Burma vary greatly in different tracts, and all along Arakan and Tenasserim volcanic islands fringe the coast. The surface rocks in the interior consist mainly of Tertiary formations classed as follows: (1) *Irrawaddy System* (Pliocene, terrestrial, and fluviatile), 20,000 feet; *upper series*, yellow friable sandstones, with beds of brown clay; no fossil bones, fossil wood scarce; *lower series*, yellow friable sandstones and conglomerates; much fossil wood, and bones. (2) *Pegu System* (Miocene, estuarine, and marine); *Yenangyaung series* (2400 feet), glauconitic sandstone and olive green clays; *Prome series* (3100 feet), petroliciferous sandstones, blue clays, and coal-seams. (3) *Basem System* (Eocene, marine), 1200 feet, sandstones and shales capped by nummulitic limestones. (4) *Chin System* (undetermined), over 10,000 feet of unfossiliferous shales and limestones. In the Irrawaddy valley sandstones prevail, intersected with seams of quartz; and above the delta the soil is mostly sandy, while it is entirely alluvial in the delta and all the way along from Cape Negrais to the estuary of the Salween. Limestone prevails throughout many parts of the Shan Hills, and also occurs in the other ranges. Gold is found in the sand of numerous streams in different parts of the country, and in the gravel of the Irrawaddy in Upper Burma; but gold-dredging has not hitherto proved profitable. Jade and amber mines are also worked in the Myitkyina district by Chinamen, the yield being very variable. Rubies, spinels, sapphires, and moonstones are found around Mogoke in the Ruby Mines district, where stiff clays overlying sandstone and marble predominate; but the washing and sifting of the gravelly matrix has not proved a profitable enterprise. Silver and lead occur extensively in the Southern Shan States, and silver, lead, tin, and wolfram in Tenasserim, but have hitherto been only sporadically worked. Coal has been found at several places in the hills on both sides of the Irrawaddy and in the Shan States, and has also been occasionally worked, but without much success. The white marble used for images of Gautama is quarried in the Sagyin Hills near Mandalay. Copper, mica, saltpetre, and antimony are found in small quantities, and lateritic iron is plentiful here and there; but by far the most important mineral product is the dark viscous petroleum yielded by the Yenangyaung oilfields in the Magwe district, and in the Myingyan and Pakókku districts on the Irrawaddy, in the southern portion of the dry central zone, and also found on the western side of the Arakan Yoma. The Upper Burma oilfields are by far the most important, and the only ones where gushing wells have been struck (at a depth of about 1100 feet), yielding a constant supply; while the crude oil is specially valuable on account of its high percentage of paraffin-wax. A pipe line runs to refineries near Rangoon (250 miles).

Flora and Crops.—The chief crops are rice in Lower Burma, and millets, maize, peas and beans, sesamum, pulses, and ground-nuts in the drier areas of Upper Burma. Now that most of the best arable land has been appropriated, agrarian troubles are beginning; but they are not yet so acute as in most parts of India. Legislation is required to prevent capitalists (mainly money-lenders from Madras in Burma) becoming rack-renting landowners. Most of the forest area is hilly ground, unfit for ploughing. About 30,000 square miles have already been set apart as permanent 'reserved forests,' managed according to sanctioned working plans; but the state owns all the forests. In the reserves special attention is given to the regeneration and improvement of teak.

Owing to its climatic peculiarities, Burma is botanically by far the richest region of India. About 2000 species of forest trees and large shrubs are already known, though many parts have not yet been systematically surveyed. Nearly 6000 species of flowering plants have been recorded under 161 natural orders, the following ten being dominant.

Buddhist Monks, with their Pupils.

Orchideæ, Leguminosæ, Gramineæ, Rubiaceæ, Euphorbiaceæ, Acanthaceæ, Cyperaceæ, Urticaceæ, Compositæ, and Scitamineæ. The proportion of monocotyledons to dicotyledons is about 1 to 2·3, and of genera to species 1 to 3·25. Burma is mainly a forest-clad country; and the forests themselves, both evergreen and deciduous, vary greatly in character, according to their elevation above and distance from the sea, their climatic and geological conditions, and the nature of the soil. The evergreen forests occur as 'littoral forests' on the estuaries and along the coast; 'swamp forests' on low alluvial parts; 'tropical forests,' containing *Thingan* (*Hopea odorata*), dipterocarps, palms, and bamboos, throughout the humid coast districts; 'hill-forests,' succeeding the tropical, above 3000 feet, and characterised by oaks, orchids, and pines (*P. Merkusii* in south, *P. Khasya* in north). The deciduous forests comprise 'dry open forests' on diluvial and older alluvial soil, characterised by *In* (*Dipterocarpus tuberculatus*) and other dipterocarps, with a few oaks, palms, and bamboos; 'dry tracts,' usually on calcareous soil, in which cutch or *Sha* (*Acacia catechu*), yielding the valuable brown dye, is one of the characteristic trees; 'mixed dry hill-forests,' in which the most valuable timber-trees occur—teak (*Tectona grandis*), ironwood (*Xylia dolabriformis*), *Padarik* (*Pterocarpus indicus*), &c.—above an undergrowth of bamboos, palms, and shrubs. The bamboo jungles often form impenetrable thickets when consisting of a small species (e.g. as in Aitakan), but one of the commonest in the Pegu Yoma in Lower Burma, the *Kyathawng-wa* (*Bambusa polymorpha*), attains a height of 110 feet, and forms large, graceful clumps, standing wide apart. The giant among the bamboos is *Wa-bo* (*B. Brandisii*), with a diameter up to 10 inches and a height of 150 feet. Besides valuable timber, many trees yield varnish, wood-oil, tannin, dyes, gums, and fibres; while the Assam rubber-tree (*Ficus elastica*) occurs extensively in the northern Myitkyina forests, and extensive Para rubber

(*Hevea*) plantations have been made in the Meigui district (12° lat). The orchids abounding in the forests mostly flower from March to May, and the forest trees from April to June. The chief fruit-trees are the mango, jack, tamarind, mangosteen, durian, and coconut.

Fauna.—Except in southern Tenasserim, which is really part of the Malay Peninsula, the Burma fauna belongs to the class prevailing also in Assam and the forest-clad Himalayas. Buffaloes and oxen are domesticated, and ponies, pigs, goats, geese, ducks, and fowls. Even elephants readily breed in captivity in Burma. The forests have wild elephant, bison, wild cattle and deer, tigers, leopards, rhinoceros, bears, apes, and monkeys. There are crocodiles in the rivers. Big-game shooting can easily be had, but it takes time and trouble, as the forests are so vast and dense. A license is necessary for shooting in reserved forests. The chief danger is fever. Among the game birds are snipe, teal, wild-geese, pea fowl, pheasants of various kinds, &c. Snakes of all kinds abound, especially during the rains, and the hamadryad or king-cobra, the most dangerously aggressive of Indian snakes, is occasionally met.

The variety of birds and of fishes is much greater than in any other part of India; and the fish caught along the coast, and in the inland fisheries left after the flood-waters recede, contribute largely to the food of the people, especially in the form of *gna-pi* or salted condiment, taken with curry and rice. In the inland tracts the lakes gradually dry up in the hot season, and the fishes remain dormant in the soil until revived by heavy rainfall in late spring; and this has given rise to the superstition that the fish are brought down in the rain. Though prohibited by their religion from killing, the Burmese eat almost any kind of fish, flesh, and fowl; and among delicacies found on the seacoast and the islands are turtles' eggs, and in the Meigui Archipelago the edible birds'-nests prized by Chinese.

Ethnology and Population.—The Burmese belong to the Mongoloid type prevailing from the Himalayas to Burma, and characterised by having a broad head, brown skin of varying shades, scanty hair on face, shortish stature, face flat, and eyelids occasionally oblique. They closely resemble the Siamese. They are law-abiding, but excitable and impulsive, fond of gambling, pony and boat racing, gay raiment, and theatricals. Their religion makes them averse from killing, but they have plenty of courage, though they despise drill. There is no caste among them, and no aristocracy, and there are no large landowners. The women have as much personal freedom as in any other country in the world. Though nominally, from a religious point of view, considered inferior to men, women often rule their husbands and families, and they have equal rights with men regarding marriage, divorce, remarriage, and partition of property. The men are good agriculturists, but the women far surpass them in business instinct and trading capacity. All wear gay silk clothing, and spend their earnings freely, seldom hoarding, and then usually in the shape of solid gold ornaments, upon which temporary loans can easily be raised if necessary. The general level of prosperity and

the standard of comfort are far higher than in India, and there are few poor, as employment is almost everywhere abundant, and at wages considerably above those obtaining in India. The staple food is rice, with fish and meat or vegetable curries; and livelihood is easy, owing to the rapid development of the province and the quantity of cultivable land still available at a moderate land-tax. The Shan tribes on the eastern hills are clearer in complexion than the Burmese, and peaceful in disposition, as are also the Karen hill-tribes in Lower Burma, many of whom have embraced Christianity; but in the mountainous tracts of Upper Burma the Chins on the west and the Kachins on the east are wild, savage, turbulent tribes, formerly much given to raiding and fighting.

The census of 1921 may be summarised thus:

Males	Females	Total
6,756,969	6,455,223	13,212,192

Over two-thirds of the people are engaged in agriculture, and only two cities—Rangoon and Mandalay—contain over 100,000 inhabitants, Rangoon having 341,962, and Mandalay 148,917. Rangoon is more an Indian (in the narrower sense) than a Burmese town, and many of the Indian immigrants are mill employees. Three-fifths of the people are native Burmese, one-fifteenth immigrants from India, and most of the rest indigenous tribes-people. The population per sq. m. is 57.

As regards religion, the 1921 returns for the province are as follows.

Religions	Religions.
Buddhists 11,201,943	Sikhs 4,843
Tibet. Religions 702,587	Jains 1,135
Mohammedans 500,592	Jews 1,185
Hindus 435,150	Zoroastrians (Parsees) 380
Christians 257,106	Others 14,228

A strong substratum of animism exists in the remoter districts.

The languages spoken in 1911 were:

Languages.	Languages.
Burmese 7,883,299	Món or Peguan 346,120
Arakanese 323,502	Hindi 154,882
Shan 908,875	Kachin 169,414
Karen 1,067,363	Tamil 125,670
Bengali 248,810	Telugu 123,162
Chin 265,238	Chinese 108,877
	Others 269,770

Religion.—The Burmese are Buddhists, and Burmese Buddhism is the purest form extant; yet there is generally underlying this professed religion a very deeply felt and strong belief in the power of unseen spirits. The highest form of the religion is that practised by the *pón-gyi* or monks, vowed to poverty and celibacy, who shave their heads, wear yellow robes, reside in monasteries in or near all the towns and villages, and are much respected and supported by voluntary food-offerings daily made by laymen. But they can cast aside their yellow robe if tired of monastic life, and return to the world of laymen. They are the teachers in the jungle districts, instructing little boys in reading, writing, and simple arithmetic. There are over 100,000 monks, probationers, and acolytes; and every male Burman must spend some time (even if only a nominal period) as a 'religious' in a monastery. The hierarchy includes an archbishop (*Thathanābcing*) and bishops (*Saddu, Gaing-ōk*), who supervise the monasteries and monks, religious discipline, and education.

Language and Literature.—The Burmese language belongs to the Tibeto-Burman branch of the Tibeto-Chinese languages. It has many local dialects, of which the most important is Arakanese. Burmese is 'agglutinative' and tonal, and is written from left to right in characters derived from the ancient square Pali, but now formed in circular and

curved lines. The alphabet consists of thirty-one consonants and ten vowels, some of the consonants forming simple sounds, like *k, p, b, d*, and others being aspirated forms, like *kh, ph, bh, dh*, while diacritical marks indicate the tone and emphasis to be put on the syllable. Colloquial, court and official, and literary styles are distinguishable; but even the simplest of these is difficult, and the number of really good Burmese scholars is small among Europeans. A peculiarity of Burmese is the addition of generic terms in indicating objects—e.g. one man, *lu-ta-yauk* (man one person); two monks, *pón-gyi-hnít* (*hnít* 'ba (monk two venerable objects); three elephants, *sin-thón-si* (elephant three things to ride); four buffaloes, *kywé-le-gaung* (buffaloes four beasts); and so on, with many other generic affixes indicating different ideas as to shape and other characteristics. From time immemorial Burmese has been a written language, the literature being handed on from generation to generation in the form of palm-leaf manuscripts, held together by bamboo pegs to form volumes enclosed between wooden covers. Printing was only introduced during the last century, after the annexation of the maritime provinces in 1826. Burma possesses two kinds of literature—the ancient Pali books, dealing exclusively with religious subjects, in metrical sections or verses; and the modern Burmese works, also for the most part metrical, and consisting of religious romances of two kinds (*Zat* and *Wuitú*), the royal chronicle (*Yazawin*) of Burmese history, and songs. The old palm-leaf manuscripts and royal records are beautiful specimens of calligraphy; but now the printing-press issues much religious and secular literature.

The grammar of the language is very simple. The difficulties of Burmese grammar are due to mistaken endeavours to assimilate Burmese to Pali, from which its way of writing was taken. The popular language is more like Chinese, which also has equally little grammar. A good ear and a good memory suffice to make a colloquial command of Burmese easy. It is called difficult by Englishmen because they naturally compare it with Hindustani, the easiest language in the world; but it is easy compared to any language in Europe.

History.—The earliest incursion of the progenitors of those now forming the Burmese nation is supposed to have come from the Central Asian highlands; but the first great epoch began with King Anawrata's reign at Pagan, in Central Burma, about 1010 A.D. Anawrata led captive the last king of Thaton, and took all the sacred books. Pagan then became the religious and political centre of a great united Burma. This was the kingdom of 'Mien,' mentioned by Marco Polo, who describes the invasion of southern China by the army of the king of Mien (i.e. Burma) in 1272. The defeat in China of the Burmese invaders was followed by a successful invasion of Burma by the Chinese or Tatars, who took and sacked Pagan, which has ever since been a deserted city of ruins, as it is to-day. For centuries to follow, as in the centuries preceding the rise of the great kingdom of Pagan, Burma was divided into small states independent of each other. At last, in the middle of the 18th century, the Peguans (Lower Burmans) successfully invaded Upper Burma, and Ava, the northern capital, was sacked and burned. The Upper Burmans rallied under a villager known to history as Alompra. He first reconquered Upper Burma and then Pegu and Tenasserim, and having thus united all Burma under his sway, died while invading Siam. A successor brought Arakan and Manipur under the power of Burma, and his dynasty endured to our own day, the last king of Burma, Thibaw, for many years a state prisoner in India, being descended from him. Various Chinese

invasions were easily repelled by the Burmese. Siam was successfully invaded, and the Shan States in the hills between Burma and Siam were retained in subjection. Then the Burmese invaded British India in 1824, and the first Burmese war followed. In Chittagong the Burmese had a small victory, and they held the British troops in check in Assam; the British sent an army to Rangoon, and up the Irrawaddy the British army went, with enormous losses from disease, but victorious at every point, and in 1826 the Burmese made peace, when the invaders were at Yandabo, about 50 miles from Ava, the capital. In the settlement then Aikan—i.e. the coast province from the Bengal boundary down to Cape Negrais—and Tenasserim were ceded to Britain. The Burmese soon worried the British representatives into going away, and in 1852 the second Burmese war between Burma and British India began. The population of Lower Burma welcomed the British, preferring them to the Upper Burmans, and in 1852 Lower Burma was annexed to the Indian Empire. The new Burmese king (1853) was King Mindon. He bargained with the British, treated traders well, entertained a British resident at Mandalay, his new capital, and abstained from provoking hostilities. During the Indian Mutiny (1857-58) Burma kept quiet. In 1879 Mindon died, and was succeeded by his son Thibaw, who massacred his brothers, sisters, and relatives. The British resident protesting against these barbarities, his position at Mandalay became perilous, and he was recalled. From 1880-85 unfriendliness was shown in many ways, by infringing the terms of the existing treaty, arranging to give to France a preponderating influence on the Upper Irrawaddy, and imposing a fine of £250,000 on a British company. The Mandalay government refusing redress, in October 1885 an ultimatum was sent, the terms of which were ignored; and early in November King Thibaw published a proclamation calling all Burmans to drive the British into the sea. On the 15th November a British force crossed the frontier and steamed up the Irrawaddy, little resistance being made. On 28th November the Burmese troops surrendered at Ava; Mandalay, with the palace, fort, and arsenal, was occupied; and Thibaw was deported to India. Early in 1886 Upper Burma was annexed to British India. Guerilla warfare was waged, but by 1890 the country was pacified.

Administration and Finance.—In 1897 Burma was raised from a chief-commissionership to a lieutenant-governorship, the seat of government being Rangoon (with hot season headquarters at Maymyo, near Mandalay). In 1922 it was made a governorship, and a diarchical system of government was introduced similar to that already set up in other provinces of India. The franchise was conferred on a larger proportion of the population than in the other provinces; and the women's vote was proportionally large. Burma is divided into eight divisions under commissioners (four for Upper Burma with Shan States and Chin Hills, and four for Lower Burma), assisted by six divisional sessions judges, and thirty-nine districts under deputy-commissioners, assisted by eight district judges. The districts form the units of administration, and are parcelled into subdivisions and townships under European and Burman magistrates. Each village tract (*ywa*) has a headman, vested with petty police and revenue powers. The Shan States are administered by their chiefs, under the supervision of two superintendents. Civil and criminal justice is controlled in Lower Burma by a chief court with five judges, and by a judicial commissioner in Upper Burma. The revenue administration is under a financial commissioner, who also controls the customs and excise, settlement, land records, agri-

culture, and veterinary departments. Financial relations with India are regulated by a 'provincial settlement,' renewed every five years. Law and order are maintained by a strong civil and railway police-force commanded by Europeans, an equally strong military police, and a garrison.

Vacant land is acquired direct from the state, and held on payment of land-tax, as determined by a land settlement made (usually for fifteen years) after survey and crop measurements. The cultivated area is some 20,000,000 acres, over 15,000,000 acres being actually cropped (of which about 1,250,000 acres are artificially irrigated).

Communications.—There are 2000 miles of metalled and 11,000 miles of unmetalled roads, and 1527 miles of railway open; but the more rapid development of Burma by means of public works, including also irrigation canals in Upper Burma and embankments in Lower Burma, &c., is retarded for financial reasons. Since 1897 the railways, all of metre gauge, have been worked by the Burma Railway Company. Besides the main trunk-line from Rangoon to Mandalay and Myitkyina, with numerous branch-lines, Rangoon is now linked with the seaports Moulmein and Bassein; and it is only a question of time and funds when the Burma railways will meet those in China and eastern Bengal. River-steamer traffic is mainly in the hands of the Irrawaddy Flotilla Company, which has a great fleet of boats of many sizes and kinds, including large and luxurious river-steamers.

Trade and Commerce.—Of the four chief seaports (Akyab, Bassein, Rangoon, Moulmein), Rangoon is by far the largest, and most of the trade passes through it. Besides a very large coasting trade, there is also a growing overland trade with China and Siam. The chief export is rice; others are teak and petroleum; then cutch, hides, cotton, and ground-nuts; and the chief imports are cotton goods and yarns, silk, salt, coal, hardware, and metals.

Education.—In 1852 the percentage of illiteracy in Burma was lower than anywhere else in Asia or in most parts of Europe, owing to the indigenous vernacular education given gratuitously by the monks in the monasteries or for small fees in the indigenous schools in the villages. From the administrative point of view, education is classed as vernacular and Anglo-vernacular, the latter being wholly under the supervision of the government Education Department, while the former is only partially supervised, as many monastic schools have not yet conformed to the departmental rules and sought registration. Missionary and all other schools under government inspection receive grants, and unregistered schools obtain no assistance. All boys have, as part of their religion, to spend some time at a monastery; hence there are few illiterates among the male Burmese. Girls are not admitted to these monastic schools, but are often taught with boys in lay schools; and girls' schools are gradually being established. The Educational Code is revised every five years, and government is assisted by an educational syndicate. The university of Rangoon, founded in 1920, has two constituent colleges, University College and Judson College.

Arts and Manufactures.—These consist chiefly in wood and ivory carving, boat-building, repoussé silver-work, cotton and silk weaving, bamboo lacquer-ware, and gold jewellery. Both in wood-carving and silver-work the designs are bold and artistic, though the execution is often rough. Mandalay palace and many monasteries are richly decorated with carved teak, often gilded, and looking-glass mosaic in many colours; and the high sterns of large river-boats, made of a dug-out hull with planked sides, are also carved. Through contact with Western

civilisation the hereditary skill in all branches of art is rapidly being impaired and lost. Gesso-work was formerly frequent on boxes containing sacred writings. Marble and brass images of Gautama are chiefly made near Mandalay. A great many rice and wood mills and oil-refineries have been set up, so that the rice and teak and oil are now exported fit for immediate use. The extension of the Indian salt-tax to Burma has killed the salt industry, and handloom-weaving and silk-making are diminishing.

Architecture and Archaeology—Except in the large towns, where masonry buildings roofed with shingles, tiles, or corrugated iron are now common,

Shway Dagon Pagoda at Rangoon.

the houses are mostly built of wood or bamboo, and thatched with coarse grass or split bamboo. Like ancient lake-dwellings, they are almost invariably raised on posts or piles, so that the open veranda in front (when there is one) may be about 2 feet above the ground, while the main part, containing the sleeping-rooms, is usually 10 or 12 feet above ground. The houses are often one-storied, as the Burman dislikes the idea of any one walking over his head. The roofs are high-pitched, with projecting eaves. Rich Burmans spend large sums in building and ornamenting monasteries (*kyauw*), rest-houses (*zayát*), and pagodas (*payá*); though minor works, like bridges, roads, tanks, &c., are also meritorious. The monasteries are mostly built of teak, with three, five, or seven tiered spire-like roofs, and are often richly carved and ornamented. Every town has several, and hardly any small village is without its own monastery. The modern bell-shaped pointed pagoda, often richly gilded, and always crowned with a metal *ti* ('umbrella'), is seen everywhere, especially on knolls. The largest and most famous is the Shway (Shwe) Dagon at Rangoon; though other celebrated ones are at Syriam, Pegu, Prome, Mandalay, Moulmein, and elsewhere. By far the finest specimens of modern Burmese architecture are to be found in and around Mandalay, and include the palace, with a lofty wooden spire, the *Mibaya* or Queen's monastery,

Thibaw's monastery, the '10,000 pagodas,' and many other beautiful works. In 1908 an Ancient Monuments Preservation Act was passed, and an archaeological survey afterwards drew up lists of historic and architectural monuments for preservation. The richest archaeological and religious historical remains are found at Pagan in Central Burma, where the oldest pagodas, plainly indicating Indian influence, date from 1050 to 1218 A.D.

Sangermano's *Burmese Empire* (1833; 2d ed. 1885) and Symes's *Embassy to Ava* (1795) are the best early books. There are handbooks and descriptive books by Mason (1883), Cuming (1893-96), Parker (1892), Bird (1897), Ferrars (1900), Nisbet (1901), Scott (1921), O'Connor, and others. See also histories by Sir A. Phayre (1884), L. W. Shakespear (1914), and G. E. Harvey (1923); Sir J. G. Scott's ('Shway Yoe's') *The Burman, his Life and Notions* (1882); H. Fielding Hall's *Soul of a People* (1898) and *A People at School* (1906); Pollok and Thom's *Wild Sports* (1900); D. A. Wilson's *East and West* (1911); Dautremere, *Burma under British Rule* (trans. 1913); Sir C. Crosthwaite, *The Pacification of Burma* (1913); Sir H. T. White, *Burma* (1923).

Burmans, a Dutch family of scholars, originally from Cologne.—(1) Peter 'the elder,' born at Utrecht in 1668, studied law at Utrecht and Leyden, and next travelled through Germany and Switzerland. At first an advocate, he became professor of History and Rhetoric in the university of Utrecht, afterwards of Greek at Leyden, where he died in 1741. In his literary career, his hot temper and intolerant spirit involved him in many controversies, often with adversaries like Le Clerc and Bentley. His chief works are editions of the Latin classics, in stately quartos, with extensive notes often dreary and tasteless to a degree.—(2) Peter 'the younger,' nephew of the preceding, born in 1714 at Amsterdam, made his studies at Utrecht, and became in succession professor at Franeker, professor at the Amsterdam Athenæum, and keeper of the public library there. He retired in 1777 on a pension, and died the year after. He edited Virgil, Aristophanes, Claudian, and Propertius, and an anthology of the Latin epigrammatists; but his editions are now little valued.

Burmanniaceæ, a small family (about 60 species) of plants, which seem to link the orchids with more typical monocotyledons. They are found in tropical forests in both hemispheres, especially in Borneo and New Guinea, and extend northwards as far as the Southern United States. They are small plants, many of them saprophytes without green colouring-matter. The six perianth-leaves are united in the form of an urn, which may be regular, or swollen so as to bring the mouth to one side. The free ends are often needle-like, sometimes all of them, sometimes three, sometimes five, with the sixth large and wide. The stamens (3 or 6) are often doubled back inwards against the perianth-wall, and are curiously expanded.

Bur-marigold (*Bidens*), a widely distributed genus of composite annuals.

Burnaby, FRÉDÉRIC GUSTAVUS (1842-85), son of a clergyman who was also squire of Somersby Hall in Leicestershire, became colonel of the Royal Horse Guards Blue, served with Gordon in the Sudan, made and described his adventurous *Ride to Khiva* in 1875, and a less famous journey in 1876 *On Horseback through Asia Minor*, and was killed by an Arab spear-thrust in the battle at Abu Klea in the Nile expedition of 1884-85.

Burnand, SIR FRANCIS COWLEY (knighted in 1902), was born 29th November 1836. He was educated at Eton and Trinity College, Cambridge (1854-58), and afterwards went to Cuddesdon Theological College with a view to becoming a clergyman of the Church of England. In December 1858 he joined the Catholic Church, and for

four months continued his studies at the house of the Oblate Fathers at Bayswater. His first farce had been produced at Eton in 1851, and at Cambridge he had founded the 'A.D.C.', of which he published a *History* in 1879. He was called to the bar in 1862, but the success of some early dramatic ventures altered his plans. He produced between eighty and a hundred pieces, chiefly extravaganzas and burlesques; four dramas; and some very successful comedies. He joined H. J. Byron in starting *Fun*, but left that paper for *Punch*, then edited by Mark Lemon, in 1863. His first contribution to *Punch* was *Mokeanna*, a burlesque on sensational romance writing; soon after appeared *How, When, and Where*, followed by the now well-known *Happy Thoughts*, which in book form soon ran many editions. Later he continued the *Happy Thoughts* series, and wrote a succession of burlesques of popular novelists, that on Quida's style, *Strapmore*, being perhaps the happiest. Editor of *Punch* from 1880 till 1906, he wrote the libretto for Sullivan's *Cheftain* (1894), and his *Reminiscences* (1903). He died 21st April 1917.

Burne-Jones, SIR EDWARD, was born at Birmingham, of Welsh descent, 28th August 1833. He was destined for the church, and educated at Exeter College, Oxford, where William Morris, the poet, was his friend; but his thoughts turned strongly to art; and having, about 1857, submitted some pen-drawings to Rossetti, whose work had powerfully influenced him, he received from this artist encouragement and guidance in his first attempts as a painter. His subjects were always poetical and imaginative. From the first he was a fascinating colourist, and his earlier works, as 'The Merciful Knight' (1864), 'Merlin and Vivien,' the figures of the two heroines of Meinhold's *Sidonian* and 'The Wine of Circe' (1867), along with much medieval quaintness both in form and feeling, possess great expressional intensity. They attain, in water-colour, greater brilliancy and purity of hue than is usual even in works executed in oil, and are sometimes, as in 'Love among the Ruins' (1873), on such an extended scale as we usually associate with the more dignified medium. About 1870 he began to be known as an oil-painter, and his works of this period are inspired by the earlier art of the Italian Renaissance, and show more of grace and less of emphasis than his former paintings in body-colour. Among his pictures are, 'The Days of Creation,' 'The Beguiling of Merlin,' and 'The Mirror of Venus' (1877); 'Laus Veneris' (painted 1873-75), 'Le Chant d'Amour' and 'Pan and Psyche' (1878); 'The Golden Stairs' (1880); 'The Tree of Forgiveness' (1882); 'The Wheel of Fortune' (1883); 'King Cophetua' (1884); 'Andromeda Chained,' 'The Fight with the Sea-beast,' and 'The Brazen Tower' (1888); and the 'Legend of the Briar Rose' pictures (four, 1890). He became D.C.L. in '881, A.R.A. in 1885 (resigned 1893), and a baronet in 1894. Several of his latest works show a realism and a thoroughness of draftsmanship and modelling in his treatment of the nude unknown in his former productions; but his colouring tended on the whole to become less splendid. He furnished many striking designs for stained glass—as for Christ Church, Oxford. In 1898 'Love and the Pilgrim' sold for 5000 guineas. He died 17th June 1898.—His son, Sir Philip Burne-Jones (1861-1926) was a painter of considerable merit.

See monograph on Sir Edward Burne-Jones by Malcolm Bell (1892); the biography by his son-in-law, J. W. Mackall (1900); and the *Memorials* of him by his wife (1904).

Burnes, SIR ALEXANDER, was born in 1805 at Montrose, in Forfarshire, where his father was provost. (The provost's father was the cousin of Robert Burns.) In 1821 he entered the Indian

army, and his knowledge of oriental languages gained him rapid promotion. After performing some important missions for the Indian government, he was, at his own suggestion, sent on a twelve-months' expedition into Central Asia. Starting from Lahore in 1832, and adopting the Afghan dress, he passed through Peshawur and Kabul, and crossed the Indian Caucasus to Balkh. Thence he passed on to Bokhara, Astrabad, and Teheran, and journeying through Ispahan and Shiraz, reached Bushire on the Persian Gulf, whence he embarked for India. On his return to England in 1833, he was received with high honours; and in September 1839, having previously been knighted and created lieutenant-colonel, he was appointed political resident at Kabul, where he was murdered by the Afghan mob, 2d November 1841. See his *Travels into Bokhara* (1834), and *Kabul* (1842); and Kaye's *Lives of Indian Officers* (1869).

Burnet, GILBERT, Bishop of Salisbury, was born at Edinburgh, 18th September 1643. At the age of ten he entered Marischal College, Aberdeen, and, four years later taking his M.A., applied himself to the study first of law and then of divinity, with such diligence and success that in 1661 he was admitted a probationer. In 1663 he visited Cambridge, Oxford, and London, where he met with many of the leading divines of England; and next year passing over into Holland, perfected his knowledge of Hebrew under a learned rabbi of Amsterdam. In 1665 he became minister of Salton, Haddingtonshire; in 1669 professor of Divinity in Glasgow University; but in 1674, having brought on himself the enmity of his old patron Lauderdale, he found it prudent to resign his chair, and settle in London, where he was made chaplain to the Rolls Chapel, and afterwards lecturer at St Clement's. In 1677 he published his *Memoirs of two Dukes of Hamilton*; in 1679-81 the first two volumes of his *History of the Reformation*, which procured him a vote of thanks from parliament; in 1680 *Some Passages in the Life and Death of the Earl of Rochester*; and in 1682 his *Life of Sir Matthew Hale*. The efforts which had previously been made were now repeated to induce him to break with the liberal and moderate party, and to attach himself to the king. He was offered the bishopric of Chichester, but refused it. In 1683 he attended the execution, and vindicated the memory, of his friend Lord William Russell. The king exhibited his unkindly spite by depriving Burnet of his lectureship; and on James's accession he went to the Continent, and travelled through France, Italy, Switzerland, and Germany. In 1684 he was introduced to the Prince of Orange, with whom he became a great favourite, and by whom he was frequently consulted in reference to the great scheme for the deliverance of England. When William came over, Burnet accompanied him as royal chaplain, and in 1689 was appointed Bishop of Salisbury. He entered on the duties of his diocese with great ardour; but his first pastoral letter, in which he founded William's right to the throne on conquest, gave so much offence to both houses of parliament, that they ordered it to be burned by the common hangman. In 1698 he was appointed preceptor to the Duke of Gloucester; in 1699 he published his celebrated *Exposition of the Thirty-nine Articles*, which was condemned as heterodox by the Lower House of Convocation. In 1714 appeared the third volume of his *History of the Reformation*; and on 17th March 1715 he died at Clerkenwell of a pleuritic fever. He was thrice married; his first wife was remarkable for her beauty, the second for her fortune, and the third for her piety. Not until 1724-34 did Bishop Burnet's *History of my Own Time* make its appear-

ance—a work that was sarcastically but foolishly abused by Swift, Pope, Arbuthnot, and other Tory writers of the day. A Whig and broad churchman, Burnet was a man of strict, almost puritanical virtue, of marvellous charity, geniality, and moderation. His style is often harsh, his judgment not always reliable, yet the honesty, earnestness, simplicity, and vigour of his writings, as well as their fullness of details, make his works very valuable to the student of history. See the Clarendon Press editions, and the exhaustive and admirable *Life* by T. E. S. Clarke and Miss Foxcroft (1907).

Burnet, JOHN, painter, engraver, and author, was born at Fisherrow, near Edinburgh, in 1784, and died at Stoke Newington, 29th April 1868. He first became known through his admirable engravings of Wilkie's works. Of his own paintings the best known is the 'Greenwich Pensioners' (1837). He wrote several books on art, the most important being a *Practical Treatise on Painting*; and he was also author of *Rembrandt and his Works* (1849), and, in conjunction with Cunningham, of *Life and Works of Turner* (1852).

Burnet, THOMAS, born in Yorkshire about 1635, studied at Cambridge, and in 1685 was elected Master of the Charterhouse. He succeeded Archbishop Tillotson as clerk of the closet to William III., but having in 1692 published a work, *Archæologia Philosophica* (also in English), displaying great learning, but treating the Mosaic account of the Fall as an allegory, he was obliged to retire from the clerkship, and lived in the Charterhouse till his death in 1715. His *Telluris Theoria Sacra* (1680–89) was written in Latin, and rewritten by himself in English. It is speculation, not science; cosmogony, not geology; he holds that horrid mountains and protuberances are the result of the Deluge. In a work on the future life, he strongly repudiated the doctrine of eternal punishment: 'Be assured the time will come when the doctrine of eternal torments will be not less odious than the doctrine of transubstantiation is now among Protestants.'

Burnet, the English name of two closely

[*Sanguisorba*] *officinale*) is common in meadows in all parts of Europe. It is cultivated in Germany on poor soils for fodder. The root-stock is astringent, and was formerly used in medicine.—Common Burnet (*Poterium Sanguisorba*) grows in dry pastures, especially on chalky soils, on which it sometimes becomes of importance, and has also been cultivated as a fodder plant. It grows wild in the United States. It used to be cultivated in gardens, its slightly astringent leaves being used in salads or soups, also as an ingredient in cool tankard (the name *Poterium* being from a Greek word signifying a drinking-vessel). *S. Canadensis* is an interesting American species sometimes cultivated in gardens.

Burnet-saxifrage (*Pimpinella Saxifraga*) is an umbelliferous plant, which, on account of its similar foliage, habit, use as fodder, and (more distinctly) astringent root-stock, has been associated or confused with burnet from the earliest times.

Burnett, FRANCES HODGSON (1849–1924), a popular novelist, was born at Manchester. About the close of the American civil war she emigrated with her parents to the United States, and settled in Tennessee. She married Dr Burnett in 1873, and settled in Washington, but divorced him in 1898, and married Mr Stephen Townsend in 1900. Her first great success was her story, *That Lass o' Lowrie's*, which, after running through *Scribner's Magazine*, was issued at New York in 1877. Her second story, *Haworth's*, appeared in 1879. Both were novels of no common power, studies of Lancashire manufacturing life. *A Fair Barbarian* (1882) and *Through One Administration* (1883) were later novels; *Louisiana* (1880) and *The Little Unfair Princess* (1902) were admirable minor tales; *The one I knew best* (1893) is autobiographical; *A Lady of Quality* (1896), *His Grace of Ormonde* (1897), and *The Dawn of a To-morrow* (1907) are novels. *Little Lord Fauntleroy* (1886), a very charming story of child life, was her best-known work; as dramatised by herself, it had brought the author over £20,000 by 1910. Other plays are *Phyllis*, *The Showman's Daughter*, *The First Gentleman of Europe*, and *Esmeralda*.

Burnett, JAMES. See MONBODDO.

Burnettising. See TIMBER.

Burnett Prizes, founded by bequest of John Burnett (1729–84), an Aberdeen merchant, to be bestowed on the authors of the two best treatises on 'The evidence that there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity; and this independent of written revelation' of any kind. On the first competition in 1815, 50 essays were given in; and the judges awarded the first prize, £1200, to Dr W. L. Brown, Principal of Aberdeen University; the second, £400, to the Rev. J. B. Sumner, afterwards Archbishop of Canterbury. In 1855, 208 essays were given in; and the first prize, £1800, fell to the Rev. R. A. Thompson, for an essay entitled *Christian Theism*; the second prize, £600, to Dr Tulloch, afterwards Principal of St Mary's College, St Andrews, for an essay on *Theism*. The four essays were published. The fund has since been applied to found a lectureship on some branch of science, history, or archæology, illustrative of natural theology. The first lectures under the new scheme, *On the Nature of Light*, were delivered at Aberdeen, in November 1883, by Professor Stokes of Cambridge, and published in 1884.

Burnett's Disinfecting Liquid is a liquid introduced by Sir William Burnett (1779–1861) for the purpose of deodorising the bilge-water of ships, sewage-water, &c. It is a strong solution (sp. gr. 2)

1, Common Burnet (*Poterium Sanguisorba*);
2, Great Burnet (*Sanguisorba officinale*);
a, a flower; b, flower-head.

allied and often united genera of Rosaceæ—*Poterium* and *Sanguisorba*.—Great Burnet (*Poterium*

of chloride of zinc, accompanied by a small amount of chloride of iron; and when intended to be used, it is mixed with water in the proportion of one pint to five gallons of water. The liquid acts only as a *deodoriser* and *antiseptic* (see ANTISEPTICS), and does not yield any vapour which can exhibit the properties of a Disinfectant (q.v.). It is of service in preserving dead animal tissues, as in the dissecting-room, and in jars containing anatomical specimens. It is said to have little action on dissecting knives, but this is doubtful. When added to bilge or sewage water, the chloride of zinc, $ZnCl_2$, mainly acts by decomposing the offensive sulphide of ammonium, NH_4HS , which it does by forming the sulphide of zinc, ZnS , and chloride of ammonium, NH_4Cl , both of which are odourless. The strong solution of chloride of zinc has also been applied to the preservation of timber from the ravages of dry-rot, and the process of so treating wood is called, after its inventor, *Burnettising*. *Creue's* disinfectant liquid is chemically the same as the above.

Burney, DR. CHARLES, musician and author, was born in 1726 at Shrewsbury, and having studied music there, at Chester, and under Dr Arne in London, he commenced giving lessons in music himself. After composing three pieces—*Alfred*, *Robin Hood*, and *Queen Mab*—for Drury Lane (1745–50), he settled as organist at Lynn, in Norfolk (1751–60), where he planned his work on the *History of Music*, published 1776–89. In 1770–1772 he travelled in France, Italy, Germany, and Austria, collecting materials for it. Beside minor works and accounts of his two tours, Burney wrote a *Life of Metastasio*, and nearly all the musical articles in *Rees's Cyclopædia*. In 1783 he became organist to Chelsea Hospital, where he died 12th April 1814. He knew intimately many of the most eminent men of the day, including Burke, Johnson, Reynolds, and Garrick. See the *Life* (1832) by his daughter, Madame D'Arblay (q.v.).—His son, CHARLES BURNLEY, D.D. (1757–1817), was a schoolmaster and classical critic. His fine library was purchased for the British Museum.

Burney, FANNY. See D'ARBLAY.

Burnham Beeches, the remains of an ancient forest in Buckinghamshire, 25 miles W. of London. The London corporation purchased the surrounding 374 acres in 1879, and set them apart for public use, 3rd October 1883. The poet Gray, early in the 18th century, first called attention in his letters to the wild woodland. Many of these beeches have been, and still are, of immense size. Mr F. G. Heath, who was the first to urge their acquirement for public use, has described them in *Burnham Beeches* (1880).

Burning, CHEMISTRY OF. See COMBUSTION. For BURNING-GLASSES, see HEAT, LENS, MIRROR. For EXECUTION, CAPITAL PUNISHMENT.

Burning Bush (*Eucynimus atro-purpureus*) is a small ornamental shrub of North America, with oblong leaves, deep purple flowers, and scarlet smooth capsules; its congener, *E. americanus*, has scarlet prickly capsules. The French *Buisson ardent* is a red hawthorn (*Crataegus Pyracantha*).

Burnley, a thriving town of Lancashire, in a narrow vale on the banks of the Brun, near its influx to the Calder, 21 miles E. of Preston, and 27 N. of Manchester. A great seat of the woollen and then of the cotton manufacture, it is a modern, well-built place, with a literary institute and exchange (1855), a market-hall (1868), the Victoria Hospital (1886), a grammar-school (temp. Edward VI.), and an ancient parish church, restored in 1856. Besides numerous cotton-mills, it has calico-printing works, iron and brass foundries, machine-shops, breweries, tanneries, and rope-works. There are collieries in the vicinity. Burnley was created

a municipal borough in 1861, a parliamentary borough (returning one member) in 1867, and a county borough in 1888. A Roman way passed through the town, and Roman remains have been found. Pop. (1871) 44,320; (1881) 63,638; (1911) 106,765; (1921, in holiday season) 103,175.

Burnouf, JEAN LOUIS, French philologist, born at Urville, 14th September 1775, became professor of Rhetoric at the Collège de France in 1817, and subsequently in succession inspector of the university, general director of studies, and librarian. Elected a member in 1836 of the Académie des Inscriptions, he died at Paris, 8th May 1844. He was the author of grammars of Greek and Latin, which have gone through numerous editions, as well as an excellent translation of Tacitus.—EUGÈNE, a great orientalist, son of the preceding, born at Paris, 1st April 1801. He first studied law, but soon devoted himself, under Abel Rémusat and Chézy, to the oriental languages, especially those of India and Persia. In 1832 he became a member of the Académie des Inscriptions, and in the same year succeeded to Chézy's chair of Sanskrit at the Collège de France, which he filled until his death, at Paris, 28th May 1852. His first works were his *Essai sur le Pali* (1826), written in conjunction with Lassen of Bonn, and *Observations Grammaticales sur quelques Passages de l'Essai sur le Pali* (1827). His next task was the deciphering of the Zend manuscripts brought to France by Anquetil Duperron. He commenced by publishing a splendid lithographed edition of the *Vendidad-Sadé*, the most important part of the *Zendavesta* (1829–43), and published from time to time in the *Journal Asiatique* the brilliant results of his laborious studies, to the admiration of the learned world. His *Commentaire sur le Yagna* (1833), a masterpiece of lucidity and erudition, first revealed the language and doctrine of Zoroaster to the western world. He next made an attempt to decipher the cuneiform inscriptions of Persepolis, in his *Mémoire sur deux Inscriptions Cuneiformes* (1836). Here, however, the later discoveries of Lassen, Holtzmann, Oppert, and others, have shown that his Zend studies hindered him to some extent in deciphering, for relying on Zend analogies he assumed too many signs for vowels, and did not leave enough for consonants. In 1840 he published the text, along with a translation, of the *Bhagavata Purāna*, a system of Indian mythology and tradition. As the fruit of six years' study of the Sanskrit books of the Buddhists, sent by Hodgson to Europe from Nepal, appeared in 1844 his *Introduction à l'Histoire du Bouddhisme*, an epoch-making work in the history of that great Asian religion. His last work was a translation of *Le Lotus de bonne Loi*, which was passing through the press at the time of his death. Among Burnouf's pupils were Max Muller, Goldstücker, Gorresio, and Nève.—ÉMILE LOUIS, nephew of Jean Louis, born at Valognes, 25th August 1821, lectured on ancient literature at Nancy, was for a time director of the French school at Athens, and wrote on Sanskrit, the Vedas, the science of religion, Japan, and Athens.

Burns, JABEZ (1805–76), Baptist minister, was born at Oldham, and in 1828 and 1829 published *The Christian Sketch-book* and *The Spiritual Cabinet*, the first two of a long series of works (over thirty in number). He was minister at Perth in 1830–35, and thenceforward till his death in Marylebone, London. Both in Britain and the United States he lectured on temperance, peace, and the abolition of capital punishment. One of his later works, *Sketches and Skeletons of Sermons* (15 vols.), reached a 14th edition; another was the *Pulpit Cyclopædia* (4 vols. 1846–60).

Burns, JOHN, born in Vauxhall in 1858, worked as a boy in a candle-factory there and in engine-works, and was foreman engineer in West Africa for a year. He became a leader in the Labour movement and an active member of the Social Democratic Federation, and came into prominence in connection with strikes. He was imprisoned for six weeks in 1887 for resisting the police in asserting the right of public meeting in Trafalgar Square. In 1889, when working in a printing-machine establishment, he was elected to the London County Council, and in the same year sat on the committee by which the great London dock strike was settled. In 1892 he was first elected member of parliament for Battersea, for which he continued to sit till 1918. In Sir Henry Campbell-Bannerman's and Mr Asquith's cabinets he was President of the Local Government Board (1905-14) and of the Board of Trade (1914), but lost popularity with extreme Radicals. He resigned on the outbreak of war in August 1914.

Burns, ROBERT, the national poet of Scotland, and in all literature one of the most singular geniuses, was born at Alloway, in the neighbourhood of Ayr, January 25, 1759. The history of most of his life is so well known, and what is not well known requires so much conjecture and research to elucidate it, while so much space were needed for the elucidation, that a meagre sketch must here suffice. About Burns, as about Shelley, our knowledge is almost too abundant. We might prefer that poets should live only in the light of their works, and that their personal existences were as obscure as those of Shakespeare and of Homer. But, in the case of Burns, this penumbra is impossible. Even if we had not his letters and the records left by people who met him, his poems would tell all the tale. In his poems his story lives unconcealed and imperishable; his loves and hates, his vices, his mirth, his shame, his mockery, his bitterness, his repentance; there is not a mood but has its verse. There is no possibility here of keeping the poetry and blinking the poet.

Burns's family was of the humbler and less prosperous yeomanry. His father built the 'clay bigging' where he was born. When the boy was seven, the father, an intelligent man with a great belief in education, moved to Mount Oliphant, four miles south-east of Ayr. When the boy was thirteen, there was another move to Lochlea. But the elder Burns did not prosper, and died when the poet was twenty-five. His education began at a school at Alloway Mill, and was continued by Mr John Murdoch, as a kind of private tutor. This education was thoroughly literary; the boy was exercised in turning verse into prose, selecting synonyms, and so forth. A metrical *Life of William Wallace* was a favourite book; and his letters to Clarinda, and many other correspondents, owe something to a selection of correspondence of Queen Anne's reign. There is to be noticed in Burns not merely a natural fire and gift of expression, but a steady conscientious culture of the gift. He had scarce any Latin, and no Greek, but it is not easy to see how his poetical style could have been improved by a knowledge of these languages. With French he was acquainted, and however much one may believe in the educational influence of Greek, it is perfectly plain that true literary genius can dispense with it. Unlike Hogg, Burns had always more or less consciously studied the *technique* of his art. He only fails when he imitates the artificial English manners of his age. Among the early influences which give the ply to his genius, ought, no doubt, to be reckoned the popular tales and ballads and songs of Betty Davidson, an old woman

who lived with the poet's family. One of the first books that Sir Walter Scott ever possessed was a set of ballads, collected by himself when a boy, bound in three volumes, and often rescued with difficulty from the servants. Burns grew up with the same old lays in his ears, not read on fly-sheets, but recited. Popular Scotch poetry and traditions are thus the soil, as it were, in which the genius of our two Scottish poets grew. But Scott saw life in the magic of romance. Burns beheld it in the light of every day.

Even in boyhood the education and native genius of Burns soon made him friends among people born to a better place at the table of life than his own. He went to a dancing-school, and began to make a great deal of love for himself and for less confident swains. He read Allan Ramsay, and began to write a little. Acquaintance with sailors and smugglers very considerably widened his moral ideas. He became a kind of rural Don Juan, though he had too much heart for the rôle. It is useless to deny that the tone of Scotch rustic morality about the relations of the sexes is, and was, very like the morality of Sicilian swains in the time of Theocritus. If Burns had to appear among the penitents, there were seven other sinners with him. The institution of wooing a bonny lassie 'when the kye comes hame,' the *Oaristys*, as Theocritus and Homer call it, has never been peculiar to Sicily. Burns was a man of more attractions and stronger passions than his neighbours, and when that has been said, there is really no more to say. A worse man, or a man with a worse heart, would easily have escaped from the entanglement with Jean Armour. A luckier man might have married Highland Mary, and been happy with his one true love, but such luck is given to few.

The death of Burns's father in 1784 left him to try to farm for himself. Farming without capital was, even then, like gambling without capital. One reverse meant ruin. Burns's husbandry went ill, he met Jean Armour, the entanglement began (he was then twenty-five), and out of his poverty, his passion, his despair, and his desperate mirth, came the extraordinary poetic harvest of 1785. To this year belong the *Epistle to Davie*, *Death and Dr Hornbook* (where the poet is very frank about his convivialities), *The Two Herds*, *The Jolly Beggars*, *Hallow E'en*, *The Cottar's Saturday Night*, *Holy Willie's Prayer*, *The Holy Fair*, and *The Address to a Mouse*. If we had only the verses of this year, Burns would remain the greatest of known popular poets. His topics were topics at which, probably, dozens of other rural rhymers were hammering—the quarrels, lay and clerical, of the neighbourhood; banter of local notorieties; and sketches of rural manners. But then Burns touched them with the hand of an artist; he was a master already in this craft, and no poet, perhaps, of any language has ever attained such a wild perfection as he reaches in the reckless merriment of *The Jolly Beggars*:

Life is all a variorum,
We regard not how it goes;
Let them cant about decorum
Who have characters to lose.

That is the essence of *Les Guenex*; M. Richepin gives us a volume of the poetry of beggarhood, but a little is enough. The next year found Burns still busy; it was another *annus mirabilis*, though much of the verse is satirical, and necessarily less interesting. *The Two Dogs* is a masterpiece of humour; *The Lament and Despondency* remind one of Regnier, who sinned in earnest and repented in verse. In this year there was abundant trouble with Jean Armour; there was the betrothal to Highland Mary, and her death. Looking about him for money, that he might

emigrate to Jamaica, Burns published the famous and much-sought-after Kilmarnock edition of his poems (600 copies, 1786). Their fame spread, Burns got a few pounds, and was just setting sail, when the praises and promises of admirers induced him to stay in Scotland. In winter he went to Edinburgh, met the wits and the great, was a lion, at least tasted all the sweets of that estate, with much more than a necessary proportion of the bitter. He was as proud as he was poor, and no doubt fancied many slights and affronts that were in the mind of no one else. Here, too, Scott saw him, Scott being then a boy, and remembered the fire and beauty of his dark brown eyes. The poems were reprinted in 1787, and some money came in (about £500 ultimately). Burns erected a tomb over Fergusson, his ill-fated predecessor and master. On returning to the country, he was much made of, and, like Sir Lancelot in the romance, 'fell to his old love again,' Jean Armour. After a Highland tour with a blackguard dominie called Nicol, Burns went back to Edinburgh, and began the epistolary flirtations with Mrs M'Lehose (Clarinda). Neither the friendship with Nicol nor the affair with Clarinda was very creditable to Burns's taste. In the 'Letters to Clarinda,' as Mr R. L. Stevenson remarks, 'the design may be that of an Old Hawk, but the style is more suggestive of a Bird of Paradise'; indeed, Burns elsewhere speaks of himself as 'an old hawk at the sport' of bringing his bird to his feet. Like Keats's love-letters, the letters to Clarinda should have been burned at once. But men will write, and women will print, while the world stands. By this date Mr Johnson had set about publishing his *Scots Musical Museum*, to which we owe all that is briefest and brightest of Burns. He contributed an astonishing number of the most beautiful, tender, passionate, and vivacious songs in any language, chiefly adapted to old Scotch airs, and moulded now and then on old Scotch words. An edition of Scotch songs, with the old words and the words of Burns, would be a valuable book, though not precisely a book for drawing-rooms. Many of the ancient ditties were of a singular license, though that does not make them less useful to the student of popular manners and of literary history. But very often, as in the deplorable case of Allan Ramsay's verses, the new songs have devoured and destroyed the old. Indeed, as Hogg's mother told Scott, printing popular songs generally kills their natural life, much more than the printing of substituted words.

In 1788 Burns was writing to Mrs M'Lehose of Jean Armour as 'the expiring glimmer of a farthing taper beside the glory of the meridian sun.' Such are the loves of the poets: here is their gratitude — 'in less than two months they were married,' Burns proving better than his word. 'I am the fool,' he wrote once, 'of my feelings and attachments.' He took a lease of Ellisland farm, on the Nith, near Dumfries, and next year received an appointment in the Excise. The following year again (1790) saw the birth of *Tam o' Shanter*, written in one day. By 1790 Ellisland, like all Burns's worldly enterprises, proved a failure. In November 1791 came his farewell to Clarinda (Mrs M'Lehose) — 'Had we never loved so kindly;' and other nymphs had been loving rather blindly in the meantime. Burns left his farm, withdrew to Dumfries and to gauging, flirted with the French Revolution, drank, wrote songs, expressed opinions then thought Radical, and made himself unpopular with the local lairds. If he wrote lampoons on ladies at this date (1794), Horace, Martial, and Lancelot at different times behaved no better. In 1795 he became, one may be glad to note, a patriot again, and wrote songs against the French. He

died—the deplorable causes of his death need not be lingered over—on July 21, 1796.

His country has been much scorned for her treatment of Burns. How was she to treat him? He deserved, what Socrates said *he* merited, 'to be kept at the public expense in the town-hall.' But he would not have accepted the offer had Scotland possessed a Prytaneum, and had Scotland made the offer. He did not try to live (as others in his position, and not without a share of his genius, have lived) by literature. He came too early. Such a poet now might actually exist on the proceeds of his poetry. What can the world do for such geniuses as Burns and Byron? They do not 'plough a straight furrow,' as the Greek proverb ran; their passions are part of their glory, their sorrow, and their shame. Their reward is immortality.

Burns is so much the greatest of Scotch poets that no other comes into the reckoning. Scott is a genius more universal, more genial, and a character infinitely more amiable and delightful. But for the mere essence of poetry and spirit of song, there is not the equal of Burns, not only in Scotch verse, but in the literature of the world. Sappho and Catullus are his peers; perhaps, indeed, no other lyric poet can be named with Sappho. The Tenth Muse does not compete with mortals, as the Nine sang against Thamyris the Thracian. She has a legendary magic, and dwells alone. But Catullus, with much of the fire, affection, and humour of Burns, has nothing like his range. Burns is not only a lyric poet of unsurpassed energy, and of an art usually unerring, but he is a satirist, and a descriptive poet second to few. He takes our hearts by storm; he rushes in with the fifes and pipes playing gloriously; he wins us at once by a natural intrepid gallantry of art. It is for this gay courage, or again for his brief natural sadness, that he is so esteemed, and for an art neither fairy-like, like Keats; nor magical, like Virgil's; nor full of winning grace, like that of Horace; but simple, unaffected, completely appropriate, and classically clear. For loyal despair what can equal

Now a' is done that men can do,
And a' is done in vain;

for loyal gallantry,

Oh, Kenneth's on and awa, Willie!

for fresh beauty of nature,

When o'er the hill the eastern star;

for proud content,

I hae a wife o' my ain!

for jollity (the rhyme Scott parodied in his last year),

Blythe, blythe, and merry was she;

for pathos,

John Anderson, my jo, John!

and so on. Who can number all these watchwords of the Scotch people, to which a ready response is made by how many myriads of hearts all the world round! If he carried the famed theory of Auncassin rather far when he wrote

The kirk and state may gae to hell,
And I'll gae to my Anna,

his example was not so attractive as to tempt many readers after him. It is not the faults of Burns, on the whole, nor his shamefaced glorying in them that remain in the memory and the imagination. We cannot believe that he has really encouraged the faults of his countrymen, as some say. There is no encouragement in that shamefaced glorying of 'The Daddy o't,' nor in his pitiful repentances. It is the good element in him, the tender heart, and proud courage and sound humour that survive,

that inspire his verse, and communicate themselves to his hearers. On the rest the righteousness of Oblivion scatters his poppy, and leaves us only the memory of a great poet.

Bibliography.—Poems (Kilmarnock, 1786; Edinburgh, 1787; London, 1787; Edinburgh and London, 1793).—Editions, with Life, by Currie (4 vols. London, 1800); Allan Cunningham (8 vols. London, 1834); Chambers (with the poems and letters interspersed throughout the life, 4 vols. Edin. 1851; new ed. by W. Wallace, 1896); W. Scott Douglas (7 vols., with Life, &c., by Prof. Nichol, Edin. 1877-82; reissued 1896); Henley and Henderson (4 vols. 1896-97); and the present writer (1 vol. 1896). There were many minor editions in the centenary year from Burns's death, 1896, when enthusiastic commemorations were carried out, monuments erected, and a Burns exhibition held at Glasgow. See also the Life by Lockhart; by Shairp, in 'Men of Letters'; by Alexander Smith, in the 'Globe' series; the Essays by Carlyle, and by R. L. Stevenson (*Men and Books*); the French Life and Works by Angellier (Paris, 1893); the German study by Hans Hecht (Heidelberg, 1921). There are German translations by Freiligrath, Ruete, Bartsch, and others, besides Flemish and other versions.

Burns and Scalds are injuries to the body caused by excessive heat or by chemical agents. These accidents are extremely common; moreover, they are in their severer forms far the most painful of injuries, and the most commonly fatal in civil life. Dupuytren's classification in six degrees, according to the depth of the injury, is now generally accepted: (1) skin reddened; (2) skin blistered—i.e. cuticle destroyed; (3) true skin partly destroyed; (4) skin wholly destroyed; (5) soft parts below skin (muscles, tendons, &c.) more or less destroyed; (6) all parts, including bone, destroyed. In almost every burn beyond the first degree, two or more of the degrees are combined in different parts of the affected surface. The last two are rarely met with. But the danger to life from these injuries depends even more on their extent than on their depth; if a very large surface of skin be involved, even in the first or second degree, the case is a serious one; and the more so the younger the sufferer. Persons 'burned to death' in a conflagration, however, perish much oftener by suffocation, resulting from the noxious gases evolved, than from the effects of a burn properly so called.

In a severe burn or scald the pain is intense, and the Shock (q.v.) and prostration extreme and often fatal. At this stage opiates, warmth, and stimulating remedies are necessary. In two days or less, if the patient survive the shock of the injury, reaction sets in, and serious internal inflammations frequently occur. The organs situated beneath the injured surface are often affected, if this be on the trunk; but whatever part of the skin has suffered there is a tendency to inflammation and ulceration of the mucous membrane of the digestive tract, particularly the duodenum. These inflammations are not readily amenable to treatment, which must in the great majority of cases be directed chiefly to the support of the patient's strength and the alleviation of his sufferings. They occur for the most part within two weeks of the injury; after this period, however, there is the further risk that he may sink from exhaustion in consequence of the prolonged suppuration which follows the separation of the dead portions of tissue in burns deeper than the first degree.

For the local treatment of burns, innumerable measures have been recommended. Here only a few of the simpler applications, suitable to the slight degrees and early stages, can be described. The clothes must be removed with the greatest care, cut and not dragged off the injured part, lest the cuticle be adherent and be torn off with them, exposing the tender skin beneath. If the burn be

of the first degree and not extensive, moist or oily applications are generally most useful and pleasant to the patient; lint dipped in a weak, warm solution of bicarbonate of soda, or in Goulard water (dilute solution of subacetate of lead), and frequently moistened, does well. If the injured surface be extensive, cold applications are apt to increase the shock and the tendency to internal inflammations; and starch and boric acid, or similar mildly antiseptic dusting powder, should be thickly dusted over the surface and covered with cotton-wool. If the burn be of the second degree, the blisters should be snipped with scissors and the contained fluid let out; but the raised skin must be carefully preserved as a protection to the tender surface below. Carron oil, consisting of a mixture of linseed oil and lime-water in equal parts (with 10 per cent. of eucalyptus oil added as a preservative), may be applied on lint. Any unirritating vegetable oil, such as olive oil, may be substituted if linseed oil be not procurable. It takes its name from the Carron ironworks, where it has long been used, and is an excellent application. In the case of severer burns, painting the surface with tincture of iodine, or applying lint soaked in solution of picric acid, hardens, dries, and soothes the skin. Recently spraying the surface with melted paraffin by means of a special apparatus has been highly recommended. It is most important that the dressings be not changed oftener than absolutely necessary, whatever application is adopted; they should be left till the discharge loosens them, or till they become uncomfortable, or offensive on account of putrefaction of the dead tissues and discharges.

The local effects of burns, particularly those of the fourth degree, are of great importance; for during and after the healing of the resulting sores there is an excessive tendency to contraction of the cicatrix, and very serious deformity often results, especially when the injury is on the neck or near the joints of the limbs. Severe injuries of this kind should therefore be under skilled observation not only during the healing process, but for some time after its completion, in order that, if any such tendency appears, measures may at once be taken to counteract it.

When the clothes catch fire, the person should lie down on the floor, and roll, or be rolled, in a rug, table-cover, or anything sufficiently voluminous to stifle the flames; and afterwards the clothes, especially stockings, should be removed with great care, lest the cuticle should separate with them, which would materially increase the sufferings of the patient.

Extensive scalds or burns are very fatal to young children; and it must be remembered that their skin is more susceptible to external impressions, and will suffer from a degree of heat innocuous to an adult. Infants have frequently been scalded to death in too hot baths, or by too hot fomentations. The principles of treatment for burns produced by the contact of chemical agents to the skin, are the same as those for burns by fire.

Burnside, Ambrose Everett, American general, born at Liberty, Indiana, 23d May 1824, served an apprenticeship to a tailor, but received a nomination to West Point, where he graduated in 1847. He left the army as first-lieutenant in 1852, but returned as colonel of volunteers in 1861, commanded a brigade at Bull Run, and in February 1862 captured Roanoke Island. Having rendered important services at South Mountain and Antietam, he in November reluctantly superseded M'Clellan. On December 13, he crossed the Rappahannock, and attacked Lee near Fredericksburg, but was repulsed with a loss of over 10,000 men, and was soon after transferred to the department of Ohio. In November 1863 he successfully held Knoxville

against a superior force, and in 1864 he led a corps under Grant through the battles of the Wilderness and Cold Harbour. Resigning in April 1865, he was elected governor of Rhode Island (1866-68), and United States senator in 1875 and 1881. He died 3d September 1881.

Burntisland, a seaport of Fife, on the Firth of Forth, 5 miles N. of Granton by steam-ferry (1848), of great importance till the opening of the Forth Bridge in 1890. Backed by the Bin, 632 feet high, it has a quaint parish church (1594), and the old castle of Rossend, where Chastelaid (q.v.) incurred his doom. The harbour has been much improved; coal is shipped in large quantities; and ships are built. In summer Burntisland is resorted to as a watering-place. It is one of the five Kirkcaldy burghs. Pop. 5700.

Burnt Offering. See SACRIFICE.

Burnt Sienna, a fine orange-red pigment, obtained by burning the ferruginous ochreous earth known as Terra di Siena. See SIENA. For BURNT UMBER, see UMBER.

Burnt Stones, antique carnelians found in ruins, and apparently acted upon by fire, having a dull appearance externally, but exhibiting a beautiful red colour when held up to the light.

Burr, AARON, an American statesman, born at Newark, New Jersey, 6th February 1756, graduated at Princeton, where his father and grandfather (Jonathan Edwards) had been presidents of the college, and in 1775 joined the patriot army, in which he gained a high reputation, and in 1777 the rank of lieutenant-colonel. Retiring in 1779, he was in 1782 called to the bar, where he soon became a leader. He was attorney-general in 1789-91, United States senator in 1800-5. His defeat in a contest for the governorship of New York led him to force a duel (11th July 1804) on the most active of his opponents, Alexander Hamilton, who had been his personal rival for many years, and who now fell mortally wounded at the first fire. Burr fled to South Carolina, and though indicted for murder, returned after the excitement had subsided, and completed his term as vice-president. He now prepared to raise a force to conquer Texas, and establish there a republic, and ultimately (said his enemies, unjustly) dismember the Union. This enterprise was proclaimed by the president, and Burr tried for treason (1807). Acquitted, but bankrupt in reputation, he spent some wretched years in Europe, and in 1812 returned to his law practice in New York. Here, shunned by society, the unhappy man, who had long survived all the members of his own family, died on Staten Island, 14th September 1836, in the home of an old friend. Of polished manners and fascinating address, he came to be universally regarded as self-seeking and untrustworthy. See his *Journal* (1903), *Lives* by Merwin (1899), Wandell and Minnigerode (1925).

Burra Burra, a famous copper-mine in South Australia, 101 miles from Adelaide, whence between its discovery in 1844 and the time when it ceased working about 1880 ore to the value of near £5,000,000 was raised. Since 1905 attempts have more than once been made to work it again.

Burrard Inlet, a narrow inlet at the south-west corner of British Columbia, a little north of the mouth of the Fraser River. Nine miles long, it forms one of the finest harbours on the Pacific coast, deep, safe, and easy of access for the largest ships. It has become of much more importance to the world since the opening of the Canadian Pacific Railway, whose terminus is at Vancouver on the north shore of this inlet. It is rich in fish.

Bur-reed (*Sparanium*), a genus of Typhaceæ

closely allied to the Bulrush (q.v.), and of similar habitat and distribution, but readily distinguished by its globose flower-heads.

Burrell, or BHARAL, the 'blue sheep' (*Ovis nakura*) of the Himalayas, connects the typical wild Sheep (q.v.) with the goats.

Burriana, in Spain, 34 miles N. of Valencia, is on an estuary a mile from the Mediterranean, with a harbour on the open sea; pop. 15,000.

Burrinjack, a great irrigation dam on the river Murrumbidgee (q.v.).

Burritt, ELIHU, 'the learned blacksmith,' was born at New Britain in Connecticut, 8th December 1810, and bred a blacksmith, but devoted his leisure to study, especially to mathematics and languages, learning Latin, Greek, Hebrew, Arabic, and other oriental tongues, and almost all modern European languages. He was, however, much better known to the world as an earnest apostle of peace than as a scholar. At Worcester he edited the *Christian Citizen*, advocating the peaceful settlement of international difficulties and the doctrine of 'universal brotherhood,' for which purpose he also travelled through Europe and the United States. His chief works are *Sparks from the Anvil* (1848), *Olive Leaves* (1853), *Peace Papers* (1869), *Lectures and Speeches*, and *A Walk from John o' Groat's to Lend's End* (1865). He took a prominent part in several Peace Congresses, and in advocating an ocean penny-postage. For many years he resided in England, from 1865 to 1870 as United States consul at Birmingham. He died at New Britain, 6th March 1879. See the memorial volume containing his Life, by Charles Northend (1879).

Burroughs, JOHN (1837-1921), a popular author on both sides of the Atlantic, born in Roxbury, New York. He was brought up on a farm, and after some years of teaching, journalism, and clerking in the treasury department at Washington, he settled down in 1874 on a farm in New York, to divide his time between literature, fruit-culture, and periodic duties as a bank-examiner. His books mostly deal with country life, and show great sympathetic insight into the life of nature. He is a born naturalist, and, whether he discourses of flowers, birds, fishes, or even insects, displays a loving interest suggestive of his nearest English analogue, White of Selborne. His chief works are *Wake Robin* (1871), *Winter Sunshine* (1875), *Birds and Poets* (1877), *Locusts and Wild Honey* (1879), *Pepacton* (1881), *Fresh Fields* (1884), *Signs and Seasons* (1886), *Sharp Eyes* (1888), *Indoor Studies* (1889), *Riverby* (1894), *A Study* (1897), *The Light of Day* (1900), *Squirrels and other Fur-bearers* (1900), and *Bird and Bough Poems* (1906).

Burrows, MONTAGU (1819-1905), naval commander and professor of history, was born at Nadley near Barnet. He took part in engagements against the Malay pirates (1836) and at the capture of St Jean d'Acre (1840), and became commander in 1852. Then going up to Oxford, he took a double first, and became Chichele professor of modern history (1862-1900) and fellow of All Souls (1870). His works include *Pass and Class* (3rd ed. 1866), *Constitutional Progress* (2nd ed. 1872), *Worthies of All Souls* (1874), *Parliament and the Church of England* (1875), *Wiclif's Place in History* (1882), *Life of Hawke* (1883), *The Cinque Ports* (1888), *Commentaries on the History of England* (1893), *History of the Foreign Policy of Great Britain* (1895), and *Autobiography* (1908).

Bursary, the annual proceeds of a sum permanently invested for the maintenance of a student at a Scottish university. Small bursaries were long the only equivalents for the English scholarships; but the University Commissioners of 1863

consolidated many, and removed some antiquated restrictions. In some cases a preference for a particular name or birthplace remains.

Burscheid, a town of Prussia, on the Wupper, 20 miles SE. of Düsseldorf, with woollen and plush manufactures; pop. 10,000. See BURTSCHIED.

Burschenschaft is the name of a famous association of German students, at one time prominent in the politics of the Fatherland. The name is derived from *Bursch*, a word ordinarily meaning 'student' or 'young fellow,' but more properly a student as member of an association. *Bursch* is itself from the Lat. *bursa*, 'purse,' the common fund of a company of students living at a common table in the universities of the middle ages. The *Burschenschaft* was a club of students who had fought in the great war of liberation, and was founded at Jena in 1813; its aim, in contrast to the mainly convivial character of other student clubs, to cherish the ideal of German national unity. Soon the *Burschenschaft* comprised students of fourteen universities; but it was inevitable that in the time of reactionary policy the club should be suspected of revolutionary tendencies, and in 1819 the *Burschenschaft* was dissolved by the Prussian and other governments. The result was the formation of numerous secret and really revolutionary associations, with prosecutions and imprisonments. Not till 1848 were student clubs freed from severe restrictions.

Burseraceæ, an order of archichlamydeous dicotyledons akin to *Meliaceæ*. There are some 300 species, tropical trees and shrubs, with dotted leaves. Many yield resins and balsams. See BALSAMODENDRON, BALSAM OF GILEAD, BDELIIUM, BOSWELLIA, ELEMI, MYRRH.

Burslem, a town of Staffordshire, in 1910 incorporated with the county borough of Stoke-on-Trent (see STOKES-UPON-TRENT), and known as the 'mother of the potteries,' the pottery manufacture having been here established about 1644. Porcelain and pottery of all kinds are produced on a large scale. Burslem, a municipal borough since 1878, was the birthplace of Josiah Wedgwood; and a Wedgwood Memorial Institute (1870) serves as a school of art, free library, and museum. Pop. (1851) 16,954; (1901) 38,766.

Burt, THOMAS (1837-1922), Liberal and Labour member of parliament, was born at Murton Row, Tynemouth, and worked in coal-mines from the age of ten. In 1865 he was elected secretary of the Northumberland Miners' Mutual Provident Association. He was a British representative at the Berlin Labour Conference (1890), president of the Trades Union Congress, Newcastle (1891), sat for Morpeth (1874-1918), was secretary to the Board of Trade 1892-95, a Privy-councillor from 1906. See *Life by Watson* (1908), and his *Autobiography* (1924).

Burton, SIR FREDERIC WILLIAM, water-colour painter, was born in County Clare in 1816, and educated at Dublin. In 1856 he became a member of the Society of Painters in Water-colours, and in 1884 a knight. From 1874 till 1894 director of the National Gallery, he died 16th March 1900.

Burton, JOHN HILL, historian, was born at Aberdeen on the 22d of August 1809. Having graduated at Marischal College, Aberdeen, he was articled to a lawyer, but soon came to the Edinburgh bar, where, however, he mainly devoted himself to study and letters. He was in 1854 appointed Secretary to the Prison Board of Scotland, and became one of the Prison Commissioners for Scotland. He held the old office of Historiographer Royal for Scotland, was LL.D. of Edinburgh University, and D.C.L. of Oxford. He died near Edinburgh, 10th August 1881. For a long series of years, from 1833 downwards, he was a

contributor to the *Westminster Review* of articles on law, history, and political economy; to *Blackwood's Magazine*, the *Scotsman*, &c., he furnished many literary sketches; and he was a contributor to the first edition of this *Encyclopædia*. Among his original works may be mentioned *Life of Hume* (1846), *Lives of Simon Lord Lovat and Duncan Forbes of Culloden* (1847), *Political and Social Economy* (1849), *Narratives from Criminal Trials in Scotland*, *A Manual of Scottish Law*, *A Treatise on the Law (Scottish) of Bankruptcy*, *History of Scotland from the Revolution to the Extinction of the Last Jacobite Insurrection* (1853), *The History of Scotland from Agricola's Invasion to the Revolution of 1688* (7 vols. 1867-70; new edition, enlarged and partly rewritten, 8 vols. 1873), *The Book-Hunter* (1862), *The Scot Abroad* (2 vols. 1864), *The Cairngorm Mountains* (1864). He edited vols. i. and ii. of the *Register of Privy Council (Scotland)* for 1545-78; and issued *A History of the Reign of Queen Anne* in 1880. He further edited the works of Bentham (in conjunction with Sir John Bowring), with an able introduction; and published a volume of *Benthamiana*. See *The Book-Hunter*, new edition (1882), with Memoir by his wife.

Burton, SIR RICHARD FRANCIS, one of the most daring and successful of modern travellers, was born in 1821 at Torquay, the son of Colonel Joseph Natterville Burton, and was educated in France and England. In 1842 he entered the Indian service, and served in Sind under Sir Charles Napier. In 1851 he published his first important work on *Sindh*. Burton acquired a very familiar acquaintance with Hindustani and Persian, and learned to speak Arabic like a native. He resolved to explore Arabia in the disguise of an Afghan pilgrim; and after a visit to England, in 1851 he set out on his journey. His *Personal Narrative of a Pilgrimage to El Medinah and Mecca* (1855; new ed. 1879-80) records one of the most daring feats on record. His next journey was into the country of the Somalis, in Eastern Africa. He was chief of the staff to General Beaton in the Crimea. In 1856 he set out in company with Speke (q.v.) on the journey which led to the discovery and exploration of the great lake of Tanganyika (q.v.), and afterwards travelled in North America. In 1861 he married, and was appointed consul at Fernando Po; and while holding this appointment, he visited the Cameroon Mountains, and went on a mission to the king of Dahomey. He was subsequently consul at Santos in Brazil, and at Damascus; and in 1872 he succeeded Charles Lever in the post of British consul at Trieste. In 1876-78 he paid two visits to Midian. In 1882 he visited the gold-producing country of the Guinea coast, along with Captain Cameron. He received the gold medal of both the English and French geographical societies. He was master of thirty-five languages and dialects. He received the honour of knighthood in 1886. Lady Burton, who was of a Catholic family, was the companion of his wanderings from 1861, and wrote a narrative of travel, *Arabia, Egypt, India* (1879), and *Inner Life of Syria, Palestine, &c.* (1875).

Among Burton's many works are: *First Footsteps in East Africa* (1856), *The Lake Regions of Central Africa* (1860), *The City of the Saints* (1861), *Wanderings in West Africa* (1863), *The Nile Basin, Valerian and the Vampire* (1869). He also wrote two other books on Sind, and works on Goa, Abbeokuta, Paraguay, Brazil, Syria, Zanzibar, Iceland (*Ultima Thule*, 1875), Bologna, and Midian; on falconry, sword exercise, and bayonet exercise; gave us a translation of *Os Lusitadas* of Camoens (1880), his lyrics, and a *Life and Commentary* (1881); and a history of *The Sword* (1883).

In 1885-88 he published a new and literal translation of the *Arabian Nights* (q.v.) (10 vols. and 6 vols. of supplement), of which his wife issued an expurgated edition. He died 20th October 1890.

See Lives by Hitchman (1887), Lady Burton (1887), Miss Stusted (to confute Lady Burton's view, 1896), and by T. Wright (1906), and Penzer's *Bibliography* (1923).

BURTON, ROBERT, author of the *Anatomy of Melancholy*, was born at Lindley in Leicestershire, in 1577, and educated at Nuneaton and Sutton Coldfield. He entered Brasenose College, Oxford, in 1593, and in 1599 was elected scholar of Christ Church. In 1614 he took his B.D., and two years later was presented by the dean and chapter of Christ Church to the vicarage of St Thomas at Oxford, and about 1630 by Lord Berkeley to the rectory of Segrave in his native county. Both livings he kept 'with much ado to his dying day,' and appears to have continued all his life at Christ Church, where he died 25th January 1639, leaving behind him a fine collection of books, many of which were bequeathed to the Bodleian. He was buried in the north aisle of Christ Church Cathedral, where a monument was erected to his memory, on which his bust was placed, with the calculation of his nativity inscribed above it, and beneath the epitaph he had composed for himself: *Paucis notus, paucioribus ignotus, hic jacet Democritus Junior, cui vitam dedit et mortem Melancholia*. His death took place at or very near the time he had foretold some years before by the calculation of his own nativity. This gave rise, Wood tells us, to a report that he had 'sent up his soul to heaven thro' a slip about his neck.' Burton is thus described by Anthony à Wood: 'He was an exact mathematician, a curious calculator of nativities, a general read scholar, a thro' paced philologist, and one that understood the surveying of lands well. As he was by many accounted a severe student, a devourer of authors, a melancholy and humorous person; so by others, who knew him well, a person of great honesty, plain dealing, and charity. I have heard some of the antients of Christ Church often say that his company was very merry, facetie and juvenile, and no man in his time did surpass him for his ready and dextrous interlarding his common discourses among them with verses from the poets or sentences from classical authors, which being then all the fashion in the university, made his company more acceptable.' Little is known of his life, but there is one story in Bishop Kennet's *Register and Chronicle* (1728) that must not be omitted, from the light it throws on a passage about Democritus in Burton's preface: 'In an interval of Vapours he would be extremely pleasant, and raise Laughter in any Company. Yet I have heard that nothing at last could make him laugh, but going down to the Bridge-foot in Oxford, and hearing the Barge-men scold and storm and swear at one another, at which he would set his Hands to his Sides, and laugh most profusely.'

The first edition of the *Anatomy of Melancholy* was in quarto form, and appeared in 1621. Four more editions in folio were published within the author's lifetime, each with successive alterations and additions, spite of the author's announcement in the preface to the third (1628) that he would make no more changes. In this edition also first appeared the famous emblematic frontispiece. The final form of the book was the sixth edition (1651-52), printed from an annotated copy given just before Burton's death to the publisher, Henry Cripps, who gained, Wood tells us, great profit out of the book. This great work is divided into three divisions, each subdivided into *sections, members, and subsections*, and each preceded by an elaborate synopsis of its contents. Part I. treats of the causes and symptoms of melancholy, Part II. of

the cure of melancholy, and Part III. of love melancholy and religious melancholy. One of the most interesting parts of the book is the long preface, 'Democritus to the Reader,' in which Burton gives indirectly an account of himself and his studies, and apologises for not having bestowed his time on the composition of books of divinity, for which he saw 'no such great need,' there being 'so many books in that kind, so many commentators, treatises, pamphlets, expositions, sermons, that whole teemes of oxen cannot draw them.' Burton has had no better critic than himself in this same preface. He says: 'I have laboriously collected this Cento out of divers Writers, and that *sine injuria*, I have wronged no authors, but given every man his own.' And further, of his style he says: 'I neglect phrases, and labor wholly to inform my reader's understanding, and not to please his ear; 'tis not my study or intent to compose neatly, which an Orator requires, but to express myself readily and plainly as it happens. So that as a River runs sometimes precipitate and swift, then dul and slow; now direct, then *per ambages*; now deep, then shallow; now muddy, then clear; now broad, then narrow; doth my stile flow: now serious, then light; now comical, then satyirical; now more elaborate, then remisse, as the present subject required, or as at that time I was affected.' In the same preface he tells us 'I writ of melancholy, by being busie to avoid melancholy . . . to comfort one sorrow with another, idleness with idleness, *ut ex vipera theriacum*, make an Antidote out of that which was the prime cause of my disease.'

This strange book is unique in its interest, and is far more systematic in its construction than the superficial or merely occasional reader is apt to imagine. It is indeed a farrago from all, even the most out-of-the-way classical and medieval writers, yet not one quotation out of all his ponderous learning but lends strength or illustration to his argument. Every page is marked by keen irony, profound and often gloomy humour, and by strong and excellent sense; while throughout the book there runs a deep undertone of earnestness that fits well with its concluding sentences, and at times rises into a grave eloquence of quite singular charm. The 'fantastic old great man' is as certain of immortality as the greatest masters in English literature, and his readers will ever love him with no common love. Boswell tells us that Dr Johnson said Burton's *Anatomy of Melancholy* was the only book that ever took him out of bed two hours sooner than he wished to rise; and Charles Lamb shows the influence of the book not less in many a turn of his own quaint style than in that marvellous direct imitation, the 'Curious Fragments extracted from a Common-Place Book which belonged to Robert Burton, the famous author of the *Anatomy of Melancholy*,' first published in 1801 in the small volume containing the tragedy of *John Woodvil*. Milton's *L'Allegro* and *Il Penseroso* owed much to 'The Author's Abstract of Melancholy' prefixed to his book, and Ferriar in 1798 pointed out to the world the indebtedness of Sterne. Byron speaks of its great value as materials 'for literary conversation,' but Wood had long before pointed out this merit: "'Tis a book so full of variety of reading, that gentlemen who have lost their time and are put to a push for invention, may furnish themselves with matter for common or scholastical discourse and writing.'

See Shilleto's edition of the *Anatomy* (3 vols. 1893); Bensley's notes and identifications in *Notes and Queries* (9th and 10th ser.); Whibley's *Literary Portraits* (1904).

BURTON-upon-Trent, a county borough in east Staffordshire, 25 miles from Stafford, near the junction of the Grand Trunk Canal with

the Trent, which is navigable for barges up to the town. The ancient bridge of thirty-four arches was replaced in 1864 by a new one of twenty-nine arches. Burton-on-Trent owes its rapid extension to the brewing of ale, which is the staple product of the place. The opening of the Midland Railway in 1839 paved the way for future progress. Cotton-spinning was at first the chief industry, but was discontinued in 1849. Burton's rise and progress as a brewing centre has been largely due to the suitability of the water for this purpose. There was some small local trade in beer in the 16th century; Burton ale had a reputation in London in 1630; and a considerable export trade had been established with the Baltic ports by the middle of the 18th century. Since then the trade has greatly extended, the breweries of Bass (q.v.) and Allsopp (q.v.) being on a scale of unparalleled magnitude. There are, of course, extensive cooperages, and also iron-foundries. The town was incorporated by royal charter, dated 3d September 1878. It has an endowed school, a grammar-school, a municipal school of science and art, a public library and reading-room, a museum and art gallery (1915), and a recreation-ground. A church or monastery was erected by the Trent in the 9th century; Burton Abbey was founded and endowed by Wulfric, Earl of Mercia, in 1002. It was made over by Henry VIII. with its lands to his secretary, Sir William Paget. In a fray on the old bridge in 1321 the forces of Thomas, Earl of Lancaster, were defeated by those of Edward II. The town suffered in the civil wars of the 17th century. It has been repeatedly flooded, the water standing to a depth of 4 or 5 feet on some streets in 1875. Pop. (1861) 18,745; (1881) 39,235; (1901) 50,386; (1911) 48,266; (1921) 48,927.

Burtscheid, or **BURSCHEID**, a suburb of Aix-la-Chapelle, was incorporated with that town in 1897. It has manufactures of woollens, and sulphur springs and baths. See also **BURSCHEID**.

Buru, or **BOEROE**, an island of the Malay Archipelago, in the residency of Amboyna, from which it lies about 40 miles to the W. Area, with the small island of Amblau, 3360 sq. m. The marshy coast-lands are notoriously unhealthy, but lofty mountains rise in the interior, one peak (Tomahoe) attaining an altitude of 8300 feet. A dense natural forest covers most of the country, and only a very small portion has been brought under cultivation. The soil is rich, and vegetation everywhere luxuriant; but the only important article of export is Cajeput-oil (q.v.)

Bury, a flourishing manufacturing town of south-east Lancashire, between the Irwell and the Roche, 10 miles NNW. of Manchester. It is linked by canal with Bolton and Manchester. The woollen manufacture introduced by Flemings in the 14th century attained its zenith under Elizabeth, but had greatly declined by 1738, when Bury was merely 'a little market-town,' and it has long been all but eclipsed by the cotton industry. Besides spinning and weaving factories, there are important paper, print, bleach, and dye works, and some large foundries and engine manufactories. In the vicinity are excellent freestone quarries and abundant coal-mines. Among the town's institutions are a grammar-school, a technical school, an art gallery, public library and museum; there are also fine public recreation-grounds. John Kay, famous as the inventor of the fly-shuttle, was a native. Sir Robert Peel was born in a cottage near Chamber Hall. There are statues to both. Bury was made a parliamentary borough in 1832, and has since returned one member; it became a municipal borough in 1876, and a county borough in 1888. Pop. (1851) 31,262; (1921) 56,426.

Bury, **JOHN BAGNELL**, born in 1861, professor of modern history and of Greek in Dublin, of modern history (from 1902) in Cambridge, has written histories of Greece, of the Later Roman Empire, and of freedom of thought, and edited Pindar, Freeman, and Gibbon.

Bury, **RICHARD DE**. See **AUNGERVILLE**.

Burying Beetle (*Necrophorus*), a genus of Coleopterous (q.v.) insects, of the family Silphidae, with short club-shaped antennæ, remarkable for their habit of burying the bodies of mice, moles, and other small animals, in order to deposit their eggs

Burying Beetle.

in them, and to provide a supply of food for their larvæ. They all produce a chirping noise caused by rubbing the fifth abdominal ring against the wing-covers. When touched they give off a fluid with an extremely fetid and persistent smell. They are often covered with little red mites. Some of the species are natives of Britain, among which is *N. vespillo*, in which the habits were first observed. This form is still commoner in some parts of continental Europe. It is a black beetle, about an inch long, with two bright orange bands on its wing-covers. Its sense of smell would seem to be extremely acute, and a dead animal soon attracts it, a pair generally arriving together to feed upon the body. The male proceeds to enter the corpse if sufficiently small, previous to which, however, they have sometimes to drag it to some distance to a place suitable for their purpose. The head of the insect is the only tool employed in the operation, and is held sloping outwards, and employed in a manner which exhibits great muscular power. A furrow is first made around the body, then another within the first, and so on till the earth is so excavated from beneath, that the body begins to sink, when the insects, by great efforts, drag it down into the hole, and when it is fairly in, the excavated earth is thrown back over it. The female then lays her eggs in it; and when this is accomplished, and the cravings of appetite are satisfied, it is left for the larvæ, which are of a lengthened form, with six feet, whitish colour, and a brown head.—The known species are mostly natives of Europe and of North America. Silpha and other genera of the same family are common forms on dead and putrefying bodies.

Bury St Edmunds, or **ST EDMUNDSBURY**, a municipal borough and capital of West Suffolk, a clean, well-built town, pleasantly situated on the little river Lark, 26 miles NW. of Ipswich. The *Villa Faustini* perhaps of the Romans, it received its name from Edmund the Martyr, who on Christmas-day 856 was crowned here king of the East Angles, and who in 870 was shot to death at Hoxne by the Danes. His relics were translated hither in 903, and in 1020 Canute reared a Benedictine abbey in his honour, which in time became the richest and most important in England, Glastonbury only excepted. At the dissolution its annual

income was equivalent to £200,000 of our money. Of this magnificent establishment little now remains but the noble Abbey Gate (1327-40), Decorated in style, and 62 feet high; and the Norman Tower or Church Gate (*circa* 1090), a quadrangular tower of massive simplicity, 86 feet high. The cruciform church itself, which measured 512 by 212 feet, is represented only by the west front and the piers of the central tower, one of which bears the inscription: 'Near this spot, on 20th November 1214, Cardinal Langton and the Barons swore at St Edmund's altar that they would obtain from King John the ratification of Magna Charta.' Among the many religious and charitable institutions connected with the abbey, of which portions still exist, is St Saviour's Hospital, founded by that notable abbot, Samson, whose life and actions, as recorded by Jocelin (q.v.) de Brakelonde, Carlyle has so vividly recalled in his *Past and Present*. Lydgate was a 'monk of Bury'; Richard de Aungerville, Bishops Gardiner and Blomfield, and Sir Nicholas Bacon were natives. Parliaments were held here in 1272, 1296, and 1446, the last of which ordered the arrest of Humphrey, the good Duke of Gloucester, who was found dead in his bed the morning after his arrest. St Mary's and St James's churches are both fine Gothic edifices of the 15th century; in the former is the tomb of Mary Tudor, the widow of Louis XII. of France. On the erection of the see of St Edmundsbury and Ipswich in 1914, St James's became its cathedral. The grammar-school, founded in 1550 by Edward VI., was rebuilt on a new site in 1883 in Queen Anne style. Donaldson was one of its headmasters, and amongst its scholars have been Saneroff, Cumberland, Blomfield, Fitzgerald, and Spedding. Defoe, Wollaston, and 'Mr Pickwick' were residents. Bury St Edmunds is richer in memories than, perhaps, any town of its size. The very police-office is an old Norman house, a synagogue once, and known still as Moyses's Hall; whilst the guildhall has interesting remains of antiquity. Among modern buildings are the corn exchange (1862), the Suffolk General Hospital (1826; rebuilt 1864), the barracks (1878), and the Mechanics' Institute (1853-78). Three miles SW. is Ickworth House (1792), the seat of the Marquis of Bristol. Bury was a parliamentary borough till 1918. It manufactures agricultural machinery. Pop. (1801) 7655; (1841) 12,538; (1921) 15,941. See Gillingwater's *History of St Edmundsbury* (1804); *Memorials of St Edmund's Abbey*, edited by Thos. Arnold (Rolls series, 1890 *et seq.*).

Busachino. See BISACQUINO.

Busa'co, a ridge (1826 feet) on the north side of the river Mondego, in the Portuguese province of Beira, 16 miles NNE. of Coimbra. Here Wellington, with 40,000 British and Portuguese troops, repulsed the attack of Masséna with 65,000 French, 27th September 1810.

Busbecq, OGIER GHISELIN DE, a Flemish diplomatist, was born at Commines in 1522, and educated at Louvain, Paris, and Padua. He held various offices at the court of the emperor; but is best known as ambassador of Ferdinand (1556-62) at Constantinople. He wrote two works on Turkey. He brought many MSS., coins, and plants to western Europe, and died 1592. See his *Life and Letters* by Forster and Daniell (Lond. 1880).

Busby, a town with cotton-mills and print-works, in a mining district, 7 miles S. of Glasgow by rail.

Busby, RICHARD, a great English schoolmaster, was born at Luton, otherwise Sutton St Nicholas, Lincolnshire, in 1606. Educated at Westminster School, and Christ Church, Oxford, he was in 1640 appointed head-master of Westminster School, the

duties of which office he continued to discharge until his death in 1695. He is the type of pedagogues alike for learning, assiduity, and unsparing application of the birch; none the less for his own loyalty and piety, and the grateful affection of his pupils. He was a most successful teacher, and at one time could point to no less than sixteen occupants of the bench of bishops who had been educated in his school. Among his pupils were Dryden, Locke, South, Atterbury, Philip Henry, and Bishop Hooper. He published several works, but they were chiefly for school use, and left money to found lectureships and to educate poor boys in his native place.

Busby, a military head-dress worn by hussars, and, in the British army, by horse artillerymen also. It consists of a fur hat with a short bag hanging down from the top on its right side, of the same colour as the facings of the regiment, and an upright plume in front. The origin of the name is obscure, but seems to be Hungarian, and it is said that the bag is a remnant of an ancient Hungarian long padded bag hanging down over the right shoulder to ward off sword-cuts.

Busch, WILHELM (1832-1908), humourist, was born near Hanover, and began in 1859 to draw humorous sketches for the *Fliegende Blätter*, the series called *Max und Moritz* appearing in 1860. He subsequently published in book-form *Der Heilige Antonius*, and a numerous series of witty and satirical sketches with rhyming texts.

Büsching, ANTON FRIEDRICH, geographer, was born in 1724 in Schaumburg-Lippe, and died, the director of a gymnasium in Berlin, 28th May 1793. Until the appearance of his unfinished *Erdbeschreibung* (1754-92), neither Germany nor any other nation possessed a geographical work which made any pretension to scientific treatment or completeness of execution.—His son, Johann (1783-1829), published many works on old German literature, art, and antiquities.

Busenbaum, HERMANN, was born in 1600 in Westphalia, and died rector of the Jesuit College at Munster, 31st January 1668. His *Medulla Theologiae Moralis* (1645) became a standard authority in Jesuit seminaries, though several of its propositions were condemned by the popes, and it has gone through more than fifty editions (one in 2 vols. Louvain, 1848). On the occasion of Damien's attempt on the life of Louis XV. in 1757, it was publicly burned as containing a justification of regicide. 'When the end is lawful, the means also are lawful,' is perhaps its most famous maxim.

Bush Antelope, also called BUSH BUCK, and BUSH GOAT, names common to a number of species of Antelope (q.v.), natives chiefly of the southern and western parts of Africa. According to some naturalists, they form a distinct genus (*Cephalolophus*). They are animals of more compact form, shorter limbs, and greater strength, but much less agility, than the true or typical antelopes. They are remarkable for the arched form of the back. They have short, straight, or slightly curved horns, situated far back, and often peculiar to the male sex, with usually a long tuft of hair between them. They have no tear-pits, but instead of them, a naked glandular furrow, formed of two series of pores, on each cheek. They frequent jungles, thick forests, and beds of reeds, and when pursued, seek to escape by diving into a thicket. The commonest species is the Dwyker (*C. mergens*), living in pairs in the bushy districts of South Africa. It stands about 20 inches high at the shoulder; the horns of the female are small and hidden by the hair-tuft. Among the numerous species of bush buck, the pigmy form or Kleenebok (*C. pygmaea*) is hardly larger than a hare.

Bushel (Old Fl. *boissel*, through Low Lat. perhaps from Gr. *pyxis*, 'a box'), a dry measure used in Britain for grain, fruit, &c. The quarter (abolished 1923 by the Corn Sales Act, 1921, as a measure for the sale of dry produce) contains 8 bushels, and the bushel 8 gallons, the gallon measuring 277·274 cubic inches, and holding 10 lb. avoirdupois of distilled water. Hence the imperial bushel, introduced in 1826, contains 80 lb. of water, at temperature 62° F., with barometer at 30 inches, and has a capacity of 2218·2 cubic inches.

Bushey, a Hertfordshire urban district, 1½ mile SE. of Watford, where Sir H. Herkomer established his art school in 1882; pop. 8000.

Bushido, the ancient Japanese code of chivalry inculcating honour, courage, loyalty, courtesy, and self-control. Since the abolition of chivalry it has continued as a powerful influence. It has raised the status of woman. See the article JAPAN; Knapp, *Feudal and Modern Japan* (1897); Nitobe, *Bushido, the Soul of Japan* (1900).

Bushire, or ABUSHEHR ('father of cities,' also variously written Bushahr; in Persian, Bendershehr), a principal port of Persia, on a sandy peninsula on the east shore of the Persian Gulf, in the province of Fars. The climate is most unwholesome, and the streets are narrow, ill paved, and dirty. The district is liable to be devastated by earthquakes and the simoom, and is deficient in water; but the situation is highly favourable for commerce. A great part of the exports go to Britain and her colonies. Bushire is the land terminus of the Indo-European telegraph line, and a chief station of the British Indian Steam Navigation Company. A railway has been built to Borazdjan. The chief exports are grain, opium, tobacco, raw cotton, woollen goods (carpets), fruits, perfumery, silk, and horses; the imports, cotton and woollen goods, sugar, metals, indigo, tea, spices, chinaware, and glass. Bricks stamped with cuneiform characters have been found in the vicinity, at Rishire, which is believed to have been an Elamite settlement. Pop. 27,000, chiefly Persians, Arabs, and Armenians.

Bushmaster, a very deadly South American snake (*Lachesis mutus*) of the Crotalidæ.

Bushman, or BOSJESMANS, are a nomadic race found in South Central Africa, especially in the Kalahari Desert, where they subsist on game and the desert roots. In appearance the Bushmen are thin and wiry, but not dwarfish; poor and debased when found near the Cape, but of improved appearance and intelligence farther northwards. They do not cultivate the soil, build no huts, have no cattle or goats, wear only a few rough skins for clothing, and do not gather round a king or chief; at one time a numerous race, they are now rapidly becoming extinct. In some of the mountain caves which they have inhabited, rude paintings and sculpture are to be seen displaying real artistic talent. Although they resemble the Hottentots (q.v.) in colour and features, the relationship is by no means clear. The languages of both abound in clicking sounds, but have little or nothing else in common. The two races are grouped with the Négrillos (see ETHNOLOGY); and some authorities connect them with the Semang in Malacca, the Andamanese, and the Aetas in the Philippines. Others think they may represent the palæolithic man whose traces are found in Britain and western Europe, notably the peoples who carved figures of mammoths on tusks of ivory in prehistoric France, and the cave-painters of northern Spain. Bleek divided the Bushmen clicks into five—dental, cerebral, lateral, palatal, and labial; they have also two croaks, one strong and one gentle. For the history, see Theal's works

on South Africa; see also Bleek and Lloyd, *Specimens of Bushman Folklore* (1912), and S. S. Dornan, *Pygmies and Bushmen of the Kalahari* (1924).

Bushnell, HORACE (1802-76), born at New Preston, Conn., studied at Yale, in 1833 became pastor of a Congregational church at Hartford. He held that human language cannot accurately express theological dogma, and was—erroneously—accused of heresy as to the Trinity. His chief books are *Nature and the Supernatural* (1858), *The Vicarious Sacrifice* (1865), and *Forgiveness and Grace*. See Life by his daughter (1880).

Bushrangers, in Australia, originally runaway convicts, who had taken to the 'bush' and become robbers. In the early years of the 19th century they established a reign of terror in what was then the sparsely settled Van Diemen's Land. In 1814 two officials of Port Dalrymple 'unlawfully absconded into the woods,' and 'put themselves at the head of divers profligate and disorderly persons,' of whom the proclamation names 27, including one Michael Howe, who afterwards assumed the title of 'King of the Ranges,' and escaped killing until 1818. Though most of these men surrendered or were pardoned, many would appear to have immediately resumed their course of plunder, until in 1815 martial law was proclaimed in the district by the lieutenant-governor. Stern measures were taken to repress the crime; under Governor Arthur (1824-36) 103 criminals were executed within two years. In 1830 a drastic Bushranging Act was passed in New South Wales, where at one time a band of fifty desperadoes in the Bathurst district fought regular engagements with the settlers and police, and only surrendered when a detachment of the 39th Foot was brought up from Sydney. Ten of these men were executed, and the Act, which was renewed in 1834, put a stop to bushranging on this scale. Outbreaks still occurred at intervals, as in 1840; but generally only three or four ruffians would band themselves together, and after a more or less brief and desperate course, their career would come to an untimely end, through the untiring and gallant service of the small body of mounted police. These early bushrangers were all of one class—escaped convicts whose hand was against every man, since their mere escape made them outlaws, and they must rob to keep themselves alive. Their only friends and harbourers were convicts like themselves, hutkeepers on the outlying stations; their lairs were in wild mountain gullies; their crimes (beyond mere robbery) were deliberate, unnecessary, motivated by savagery and revenge. But with the gold rush of the 'fifties a new type of bushranger came into being. The small farmers of those days, crowded off the open country by big sheep-runs, had to cultivate fertile patches in the gullies; their sons saw little or no chance of getting land to farm at all. At the same time great wealth in portable form was being taken past their doors along lonely roads from gullies still farther out. In New South Wales particularly the diggings were isolated and far from the settlements; and it was in New South Wales, therefore, that the new type of bushranger flourished most—gangs of young freemen, many of them sons of farmers, nearly all befriended by the small settlers, and attacking only gold escorts, mails, travelling traders with money, and stations when they happened to need good horses. Robbery was their object, and killing a thing to be avoided as long as possible; and while this was so, the police and the squatters were their only enemies, and they worked almost unscathed. It was only when they took to unprovoked murder that they became enemies of society. Ben Hall's gang, the most notorious of the lot—six men in all, with a leader of twenty-five years and followers ranging down to

seventeen years—robbed escorts, fought the police, besieged squatters in their own homes, seized townships, held up traffic on the main roads (with sixty prisoners in one man's charge), for nearly three years with practical impunity. But early in 1865 they began to shoot policemen unprovoked; the leaders were dead by May, and the last of the gang was hanged in March 1866. By the early 'seventies this form of bushranging had almost died out, partly because the police had been strengthened and the roads were better patrolled, partly because the spread of settlement under new land laws had absorbed the adventurers who had been the strength of the gangs. But in 1878-79 the Kelly brothers, the last of a gang of horse-stealers which had for many years operated in north-eastern Victoria, murdered a constable, took to the bush, and tried to imitate and surpass the most notable exploits of former gangs. But, while the bush-rangers of the 'twenties and the 'sixties were almost inevitable products of abnormal states of society, the Kellys were a mere excrescence. Their violence and their theatrical posings attracted more attention than they were worth; and when an astounded community began to recover its balance they were hunted down with comparative ease, though the manner of their final defeat was melodramatic in the extreme. See Boxall's *Story of the Australian Bushrangers* (1899).

Bush-shrike is the name of a sub-family of Formicariidæ, all American, and resembling the Butcher-bird (q.v.) or Shrike in their habits.

Busiu. See BUZAU.

Busk, GEORGE (1808-86), surgeon and biologist, was born at St Petersburg, the son of an English merchant. He studied in London, became a naval surgeon, but from 1855 devoted himself to scientific work, becoming an authority on the Bryozoa, on paleontology, and on anthropology. He was Hunterian professor of comparative anatomy and physiology, and president of the Royal College of Surgeons.

Busk, HANS (1815-82), one of the originators of the Volunteer movement, studied at King's College, London, and Trinity College, Cambridge, and became high-sheriff of Radnor in 1847. In spite of Melbourne's discouragement he founded a rifle club at the university; helped in 1858 to revive the only existing Volunteer corps, the Victoria Rifles.—**RACHEL H. BUSK** (1818-1907), his sister, published collections of folk-tales.

Buskin, a kind of half-boot lacing tight to the leg. The ancient tragedians wore buskins (*cothurni*), often with thick soles in order to add to the actor's height. Hence the 'buskin' is often used for tragedy as the 'sock' (*soccus*, 'a flat-soled shoe') is for comedy.

Busoni, FERRUCCIO BENVENUTO (1866-1924), born at Empoli, of Italian and German parentage, taught in Helsingfors, Moscow, Boston, and elsewhere, and settled in Berlin. Recognised first as one of the great pianists of his day (especially in Bach), he gained renown later by such compositions as his pianoforte concerto, *Doktor Faust*, and other operas. He wrote a *Sketch of a New Aesthetic of Music*.

Buss, FRANCES MARY (1828-95), promoter of the higher education of women, was the founder of the North London Collegiate School for Ladies. See her Life by Annie E. Ridley (1896).

Bussahir. See BASHAHR.

Bussorah. See BASRA.

Bussy-Rabutin, ROGER, COMTE DE (1618-93), French soldier and courtier, was imprisoned and exiled for his *Histoire amoureuse des Gaules*, a book of partly fictitious court scandals (1666). His

Mémoires and his letters to his cousin Mme de Sévigné and others have been published.

Bust may be a portrait or be purely ideal. Portrait busts of great excellence were made by the later Greek sculptors; and the Roman artists, especially in the imperial period, did good work. The *imagines* of ancestors preserved by the early Romans were mere masks of wax. The Greek *hermæ* (see HERMES) were not strictly busts. See SCULPTURE.

Bustard (*Otis*), a genus of birds, sometimes made the type of a family, Otididæ, usually ranked in the order of marsh birds like the cranes (Grallæ, q.v.). Bustards are birds of bulky form, with long neck and lank naked legs; the toes, three in number, all directed forward, short, united at the base, and edged with membrane; the wings rather rounded; the bill of moderate length, straight, or

Great Bustard (*Otis tarda*).

nearly so, with a wide gape; and in form not unlike that of a hen. They are mostly inhabitants of dry open plains, to which all their habits are adapted. They are shy but cunning, not well adapted for flight, live in companies, and feed on green parts of plants, seeds, insects, worms, &c. The nests are simple excavations in the ground.—The Great Bustard (*Otis tarda*) was at one time plentiful in some parts of England, and was also an inhabitant of the south-east of Scotland; but extending cultivation, and the persecution to which it has been subjected, have unfortunately banished it. It is common in the south and east of Europe, and yet commoner in the steppes of Tartary. It is the largest of European birds, the male sometimes weighing nearly 30 lb. A full-grown male is over a yard in length, and measures 8 feet from tip to tip of extended wings. The female is much smaller than the male. The bustards occur in small flocks, and are polygamous. The males fight freely. The maternal instincts are strong, though the nest is simple. Many of the young fall victims to birds of prey. The plumage is of a pale chestnut colour on the upper parts, beautifully varied with black; there is much white and black on the wings. The under side is whitish. The white-tipped tail is short, spreading, and rounded. A white whisker-like tuft of split-up feathers is present on each side of the throat in the summer dress of the male, and partly conceals a long stripe of bare skin on each side of the neck. The anatomy of the male exhibits a remarkable peculiarity in a large air-filled pouch, the entrance to which is between the under side of the tongue and the lower mandible.

There were only two 'droves (each of above twenty birds) left in Norfolk early in the 19th century; the last case of bustards nesting in England was at Great Massingham in 1835 or 1836. At the end of the 19th century and beginning of the 20th attempts (not quite unsuccessful) were being made to re-introduce them here and there. The Great Bustard feeds indiscriminately on animal and vegetable food, swallows frogs, mice, worms, &c., and is very fond of the green tops of turnips. Its flesh is highly esteemed for its flavour. The sharp sight, quick movements, habit of appointing sentinels, &c., make them difficult game. No difficulty is found in taming it, but all attempts to reduce it to a state of true domestication have hitherto failed, from its not breeding in the poultry-yard.—The Little Bustard (*O. tetrax*), frequent in the south of Europe and north of Africa, is only an accidental visitant in Britain. It is not half the size of the Great Bustard.—The Collared Bustard or Hubara, a separate genus (*Eupodotis undulata*), occurs in North Africa and Arabia, and occasionally strays northwards.—The Black-headed Bustard (*O. nigriceps*) is found in large flocks in the open plains of the Mahratta country. Its flesh is esteemed one of the greatest delicacies which India produces.—The Kori Bustard (*O. kori*) of South Africa, a magnificent bird, standing upwards of 5 feet in height, has a similar reputation as one of the best kinds of game.—Australia possesses a bustard (*O. australasianus*) somewhat exceeding the Great Bustard of Europe in stature. It is called Wild Turkey by the colonists of New South Wales. Its plumage is finely freckled or spotted; the prevailing colour is brown. It has become comparatively rare in the more settled districts, its flesh being particularly delicate and well flavoured, but may be seen stalking majestically in the grassy plains where human footsteps are still rare.

Busto-Arsizio, a town of Northern Italy, 20 miles NW. of Milan. It has an interesting church, and some manufacture of cotton-thread. Pop. 20,000.

Butcher-bird, a name for various members of the Shrike family (Laniidae) of perching birds. The name refers to the habit the birds have of impaling on the thorns of hedge or bush the insects, mice, and small birds which they catch. They thus form a sort of larder which often presents a curious medley. The family is represented throughout the world, with the exception of South America. The Great Gray Shrike (*Lanius excubitor*) is one of the commonest of these butcher-birds, and has been sometimes seen as a winter migrant in Britain. See SHRIKE.

Butcher's Broom (*Ruscus*), a genus of ever-

Butcher's Broom (*Ruscus aculeatus*):
a, fruit.

green, usually dioecious, shrubs of the Asparagus

group of Liliaceæ, remarkable for their reduced leaves, which are mere scales, bearing in their axils flattened leaf-like branches (cladodes) which bear the flowers upon their surface (*R. aculeatus*) or round their edge (*R. androgynus*), and are often twisted at the base, so as to reverse their upper and under surfaces. *R. aculeatus* is the common Butcher's Broom, so called because used by butchers to sweep their blocks. It grows more commonly and luxuriantly in the south of Europe. The fruit is a red one-seeded sweetish berry. It grows well under trees or shrubs, and can often be advantageously introduced for ornamental purposes. The root was formerly used as an aperient and diuretic.

Bute, an island in the Firth of Clyde, Scotland, separated from the coast of Argyll by a narrow winding strait called the Kyles of Bute, mostly under a mile wide, about 6 miles distant from the west coast of Ayrshire, and 8 miles N.E. of Arran. It is 15½ miles long, 1½ to 6½ miles broad, and 46 sq. m. in area. The surface to the north is high, rugged, and barren, attaining 875 feet in Kames Hill; in the centre and south it is low and undulating, and comparatively fertile. The coast is rocky, and has some bays. Of six small lakes, the largest is Loch Fad (2½ by ½ mile), in a cottage on whose west shore lived Kean and Sheridan Knowles. The climate is milder than in any other part of Scotland, and though moist, less so than on the west coast generally; hence, Bute is much resorted to by invalids. In the south the soil is sandy; towards the north clay predominates. Most of the arable land is under tillage, and agriculture is in a good state. The chief crops are oats, turnips, and potatoes. The principal town is Rothesay (q.v.). Most of the island belongs to the Marquis of Bute, whose beautiful seat, Mount-Stuart, 5 miles south-south-east of Rothesay, has been rebuilt since the fire of 1877 at a cost of some £200,000. Among the antiquities of Bute are Rothesay Castle, Kames Castle (John Sterling's birthplace), Kilmorie Castle, St Blane's Chapel; Dungyle, a remarkable vitrified fort on a high crag on the south-west coast; and the Devil's Caldron, a circular erection, the original purpose of which is not well known. From an early period till 1266 Bute was more or less subject to the Norwegians. The people of Bute are sometimes called *Brandanes*, presumably after the Saint Brendan (q.v.) whose name appears in Kilbrandon Sound, which separates Bute from Kintyre. Pop. (1801) 6106; (1841) 9499; (1911) 11,835; (1921, in holiday season) 19,465.

BUTESHIRE, a county comprising the isles of Bute, Arran, the Cumbraes, Holy Isle, Pladda, Inchmarnock, and some smaller islands. The area is 218 sq. m. Pop. (1871) 16,977; (1911) 18,186; (1921) 33,711. Buteshire, with northern Ayrshire, returns one member to parliament. The county town is Rothesay, in Bute.

Bute, JOHN STUART, third EARL OF, born in 1713, succeeded his father in 1723, and about 1737 attracted the favourable notice of Frederick, Prince of Wales, who made him one of his Lords of the Bedchamber. On the prince's death (1751), Bute became Groom of the Stole to his son, afterwards George III., over whose mind he obtained a strong influence. In March 1761 he was appointed one of the principal secretaries of state; and from 20th May 1762 to 8th April 1763 he was prime-minister. His government was one of the most unpopular that ever held office, its fundamental principle being the supremacy of the royal prerogative, of which the government were merely humble servants. According to Lovat-Fraser's book on him (1912) he was not incapable; but he was deemed by

the popular verdict, as set forth by a contemporary, 'unfit to be prime-minister of England, as (1) a Scotchman, (2) the king's friend, and (3) an honest man.' For some time he retained his influence over the king, but the last twenty-four years of his life were chiefly spent in complete retirement in the country. He died 10th March 1792.—His fourth descendant, John-Patrick Crichton-Stuart, born at Mount-Stuart, in Bute, 12th September 1847, in 1848 succeeded his father as third Marquis of Bute. Educated at Harrow and Christ Church, Oxford, in 1868 he was admitted into the Catholic Church by Monsignor Capel. He was author of several works, including a translation of the Roman Breviary (2 vols. 1879), and he was a contributor to this encyclopædia. He died 9th October 1900, his body being buried at Mount-Stuart, and his heart on the Mount of Olives at Jerusalem.

Butea, an Indian and Chinese genus of Leguminosæ (Papilionaceæ). The best-known species are *B. frondosa* (Dhak-tree) and *B. superba*. These trees present a gorgeous sight when covered with racemes of large orange-scarlet flowers. They yield a resinous exudation, which occurs in the form of luid red tears, often covering the twigs, and is sometimes also called Bengal Kino (see KINO). The lac insect frequents the Dhak-tree, and yields a form of stick-lac (see LAC). The fibre is used for caulking boats, and the flowers yield a beautiful yellow or orange dye.

Butler, a flourishing city and capital of Butler county, Pennsylvania, on the Conequenessing Creek, about 30 miles N. of Pittsburg (45 by rail). It has woollen, flour, and planing mills, and plate-glass and carriage factories. The surrounding region is rich in natural gas, petroleum, and coal and iron fields. Pop. (1880) 3163; (1920) 23,778.

Butler, ALBAN, Catholic hagiographer, was born at Appletree, Northampton, in 1710. He was educated at Douai, and became professor there; was for some time chaplain to the Duke of Norfolk; and at his death (15th May 1773) was head of the English College at St Omer. His great work is the *Lives of the Saints* (4 vols. Lond. 1756-59).—His nephew, Charles Butler (1750-1832), was known as a lawyer and author on legal and theological subjects.

Butler, BENJAMIN FRANKLIN, an American lawyer, general, congressman, and governor of Massachusetts, was born at Deerfield, New Hampshire, 5th November 1818. His father, who had been captain under General Jackson, died soon after, and in 1828 his mother removed to Lowell, Massachusetts, which has ever since been his residence. Graduating at Waterville College (now Colby University), Maine, in 1838, and admitted to the bar in 1840, he became noted as a criminal lawyer, a champion of the working-classes, and an ardent Democrat. He served in the legislature in 1853, and in the state senate in 1859. At the Democratic National Conventions in 1860 at Charleston and Baltimore he strove to conciliate the southern leaders; but after secession he prepared for war, and as brigadier-general of militia responded to President Lincoln's call for troops with five regiments. On 16th May 1861 he was appointed major-general of volunteers, with the command of the department of Virginia. He refused to return the slaves who came to his headquarters at Fortress Monroe as being 'contraband of war.' Early in 1862 he commanded a military expedition against New Orleans, and after Farragut's fleets had passed the forts, took possession of the city on 1st May. The citizens were passionately devoted to the Confederate cause, but General Butler's prompt, vigorous, and severe

measures crushed all opposition, maintained order, and preserved public safety. In December he was superseded, but in November 1863 received a command in Virginia. His operations on the south side of the James in May 1864 were frustrated by the arrival of General Beauregard from Charleston. The canal which he had almost completed at Dutch Gap was disapproved by naval officers. In December, in his expedition against Fort Fisher, near Wilmington, North Carolina, a futile attempt was made to breach the walls by the explosion of a powder-boat. Returning to civil life, General Butler was elected to congress in 1866, and was prominent in the Republican efforts for the reconstruction of the southern states and the impeachment of President Johnson. During his twelve years' service he warmly advocated the issue of greenbacks as national currency. In 1878 and 1879 he was nominated for governor of Massachusetts, but defeated; in 1882 he was elected, but in 1883 was defeated. His nomination for president in 1884 was not taken seriously by the people. See his *Autobiography* (1892) and the *Life* by Bland (1879). He died at Washington, 13th January 1893.

Butler, GEORGE, D.D., born in London in 1774, from a school kept by his father in Cheyne Walk, Chelsea, proceeded to Sydney Sussex College, Cambridge, of which he was elected a fellow. He was head-master of Harrow from 1805 till 1829, when he retired to the Northamptonshire rectory of Gayton, and Dean of Peterborough from 1842 till his death on 30th April 1853.—GEORGE BUTLER, D.D., his eldest son, born in 1819, was educated at Harrow, at Trinity College, Cambridge, and at Exeter College, Oxford, where in 1841 he gained the Hertford, and in 1843 took a first-class in classics. He became vice-principal of Cheltenham College, and was principal of Liverpool College from 1867 to 1882, when Mr Gladstone gave him a canonry of Winchester. He was author of various religious, educational, and other works. In 1852 he married Josephine, daughter of the agriculturist, John Grey of Dilston (see WOMEN'S RIGHTS). He died 14th March 1890. See the *Recollections* by his wife (1892).—His youngest brother, HENRY MONTAGU BUTLER, D.D. (1833-1918), was educated at Harrow and Trinity College, Cambridge, where he was senior classic in 1855. He was head-master of Harrow from 1859 till 1885, dean of Gloucester 1885-86, then master of Trinity. See a Memoir by his son (1925).

Butler, JAMES. See ORMONDE.

Butler, JOSEPH, one of the most eminent of English divines, was born 18th May 1692 at Wantage, in Berkshire, the youngest of the eight children of a retired draper. With a view to the ministry of the Presbyterian Church, he attended a dissenting academy at Gloucester, afterwards at Tewkesbury, where the future Archbishop Secker was his schoolfellow. At the age of twenty-two, he gave proof of high metaphysical ability in a letter to Dr Samuel Clarke, usually appended to that celebrated writer's *a priori* demonstration, to which it offers some objections. About this time he made up his mind to join the Church of England, and in March 1714 entered Oriel College, Oxford. He graduated in 1718, and took orders; in the same year he was appointed preacher at the Rolls Chapel, where he preached those remarkable sermons which he published in 1726. The first three, *On Human Nature*, constitute one of the most important contributions ever made to moral science. The scope of the reasoning is, briefly, that virtue is consonant with, and vice a violation of, man's nature. He

became prebendary of Salisbury (1721), and rector of Haughton-le-Skerne near Darlington (1722); in 1725 he was presented to the 'golden rectory' of Stanhope, also in the county of Durham, to which he removed in the following year. Here he resided in great retirement till 1733, and is believed to have been busy on his *Analogy*. His friend Secker, the archbishop, desired to see him promoted to some more important position, and mentioned his name once to Queen Caroline. The queen thought he had been dead, and asked Archbishop Blackburne if it were not so. 'No, madam,' said the archbishop, 'he is not dead, but he is buried.' In 1733 Butler became chaplain to his friend Lord Chancellor Talbot, a D.C.L. of Oxford, and in 1736 a prebendary of Rochester, and clerk of the closet to Queen Caroline. In 1736 he published the great work of which the germs were contained in his three sermons, and which has entitled him, in the words of his eloquent disciple Chalmers, to be called the 'Bacon of theology.' The leading aim of the *Analogy* is to show that all the objections to revealed religion are equally applicable to the whole constitution of nature, and that the general analogy between the principles of divine government, as revealed in the Scriptures, and those manifested in the course of nature, warrants the conclusion that they have one Author. The argument is valid against the deists, but it lacks completeness as a defence of Christianity. Butler's greatness is mainly on the moral side. The dedication of conscience is the beginning, middle, and end of his teaching. Duty is his last word. He puts the deists into a state of probation by plying them with arguments sufficient *in reason* to influence their practice, whether they may actually do so or not; whereas the true method of Christianity is to put something that tends to transform a man and his practice in such a way that he feels disposed and eager to lay hold of it. In 1738 he was made Bishop of Bristol; in 1740 Dean of St Paul's; in 1747 he is said to have been offered the primacy; and in 1750 he was translated to the see of Durham. In his charge in 1751 he pointed out, with characteristic depth of insight, the importance of a due maintenance of the externals of religion, as a means of keeping alive the thought of it in the minds of the people; but this subjected him to much censure as betraying a tendency to Roman Catholicism—an allegation unworthy now of serious notice. Butler's private character was such as became a Christian prelate; grave and judicious, he was at the same time meek and generous. He was kind and considerate to his clergy and people; his princely episcopal revenues he distributed munificently, as not his own. He died at Bath, June 16, 1752, and was buried in Bristol Cathedral.

His works are in a dry and uninteresting style. With a *Life* by Kippis, they were first published at Edinburgh (1804), and reprinted at Oxford (1807); there are separate editions of the *Analogy*, and of the *Three Sermons*; a *Life* by Bartlett (1839); studies by Collins (1881) and Baker (1924). Mr Gladstone published his monumental edition of the works in 1896 (2 vols., with a third volume of *Studies Subsidiary to the works*).

Butler, JOSEPHINE E. (1829–1906), daughter of John Grey of Dilston near Hexham, and wife (1852) of George Butler, Canon of Winchester, was born at Milfield. She was a prominent and very influential advocate of women's emancipation and social reform, on which she wrote several books.

Butler, SAMUEL (1612–80), burlesque satirist, son of a Strensham farmer, was educated at Worcester grammar-school, and perhaps Oxford or Cambridge. As secretary to Mr Jeffreys of Earls-Croome in Worcestershire, he is said to have occupied his leisure in the study of music and painting. In the service of the Countess of Kent he became

intimate with Selden, her steward. There is no ground for saying he was in the service of a Puritan gentleman, Sir Samuel Luke, of Cople Hoo, near Bedford, who is supposed to have sat for the portrait of Hudibras. After the Restoration he became secretary to the Earl of Carbery, Lord President of the Principality of Wales, by whom he was appointed steward of Ludlow Castle. About this time he took a wife, who brought him a competent fortune, which 'by being put out in ill securities . . . was little advantage to him.' The first part of *Hudibras* appeared in 1663; the second part in 1664 (a pirated second part having been published in the previous year); and the third part in 1678. In this witty and pungent satire on the Puritans Butler showed himself to be an inimitable master of burlesque. His command of rhyme was inexhaustible; his learning curious and copious; and his epigrammatic sayings are so happily phrased that some of them have been quoted from age to age, until they have passed into the language of daily life. The poem secured immediate popularity, and is said to have been a special favourite of Charles II. But Butler's loyalty and wit procured him no substantial preferment. All that he received from the king was a solitary grant of three hundred pounds, which he distributed among his creditors. Probably the accounts of his poverty have been exaggerated; and Aubrey hints that he had only himself to blame, for 'he might have had preferments, but he would not accept any but very good.' He is said to have been patronised in later life by the Duke of Buckingham; but there appears to be no foundation for the statement. Among Butler's posthumous *Characters* (of which the authenticity has not been assailed) is a very severe article on 'A Duke of Bucks.' From the Earl of Dorset, who introduced *Hudibras* to the king, he received some kindness. He died in Rose Street, Covent Garden, of a consumption, and was buried in the churchyard of St Paul's, Covent Garden, at the expense of his best patron, William Longueville of the Temple. In 1721 a monument was erected to Butler in Westminster Abbey. Aubrey described him as 'strong-set, high-coloured, a head of sorrel hair, a severe and sound judgment; a good fellow.'

See Z. Grey's edition of *Hudibras* (1744), and Waller's (1903); and B. Johnson's edition of the *Works* (1893).

Butler, SAMUEL, who was the son of the Rev. Thomas Butler, and the grandson of Dr Samuel Butler, headmaster of Shrewsbury School, and afterwards Bishop of Lichfield, was born at Langar in Nottinghamshire, 4th December 1835, and died in London, 18th June 1902. He was educated at Shrewsbury School under Dr Kennedy, whom he caricatured amusingly and not unkindly in *The Way of all Flesh*, and at St John's College, Cambridge, where he took his degree in 1858, having been bracketed 12th in the first class of the Classical Tripos. Butler had been designed for the church, but as the time for ordination approached he was assailed by conscientious scruples, and finally relinquished the idea of taking orders. In September 1859 he emigrated to New Zealand, where he remained until 1864. The greater part of this period was spent in sheep-farming upon a run situated among the head-waters of the river Rangitata, which was so successful that on his return to England Butler found himself possessed of enough money for his simple wants. He established himself in Clifford's Inn, London, where he lived until his death. It was his intention to devote himself to art, and he studied painting at Heatherley's School in Newman Street and other places. He became an author only, as it were, by accident. During his New Zealand days he had written several articles on subjects connected with evolution, which had appeared in the *Christchurch Press*.

At the suggestion of a friend he recast these articles, adding much to them and giving them a framework of Utopian adventure. The book in its completed form was published anonymously under the name of *Erewhon*.

The plan of the work—the adventures of a traveller in an imaginary Utopia—was of course traditional, but since the days of Swift it had not been employed with more conspicuous vigour and success. Butler was a master of delicate and trenchant irony, and he spared few of the follies and superstitions of modern life. Not unnaturally, considering its origin, *Erewhon* is rather a piecemeal affair, and the satire is occasionally somewhat erratic in its strokes, but the merely story-telling part of the book is admirably fresh and vivacious. The nucleus of the book, the reduction of the Darwinian theory to absurdity, has perhaps lost some of its power to interest a 20th-century audience, but the satire on the conventional attitude to religion in the chapter on the Musical Banks remains as mordant as ever, and the Erewhonian views of the relations that exist between disease and crime—topsy-turvy as they sounded then—have now many proselytes among modern thinkers.

Even the success of *Erewhon* did not convince Butler that literature was his vocation. He still continued to practise art, and looked upon writing merely as a recreation. *Erewhon* was followed in 1874 by *The Fair Haven*, an ironical defence of the miraculous element of Christianity, which was little understood and less appreciated, and in 1877, after a visit to Canada, which Butler undertook for the purpose of investigating the affairs of a company in which he was interested, by *Life and Habit*, in which, for the first time, he came into conflict with the views upon natural selection promulgated by Charles Darwin. By this time Butler had made up his mind that nature intended him for a writer—a decision that was emphasised by his admission as a reader to the Library of the British Museum, where he continued to work until his death, and where, as he himself admitted in one of his essays, he could alone compose freely. Evolution and kindred topics occupied him for some time.

Life and Habit was followed by *Evolution, Old and New* (1879), *Unconscious Memory* (1880), and *Luck or Cunning* (1886), a trio of controversial works, which, though less original in substance than *Life and Habit*, exhibit Butler as a dialectician of rare skill and the master of a brilliant prose style. But Butler's interests were too various to be retained even by so fascinating a subject as evolution. Between 1872 and 1885 he was engaged upon his semi-autobiographical novel *The Way of all Flesh* (posthumously published in 1903); in 1879 he returned to theological polemics in a series of articles contributed to *The Examiner* under the title 'God the Known and God the Unknown' (published in book form 1909), and in 1882 he published *Alps and Sanctuaries of Piedmont and the Canton Ticino*, a fascinating book of travel largely concerned with artistic questions. Art, in fact, although he had long since realised that he was not to win fame as a painter, still occupied a large share of Butler's thoughts. In *Ex Voto* (1888) he gave a characteristically detailed description of the Sacro Monte at Varallo, and incidentally rescued the sculptor Tabacchetti from oblivion. About this time, too, he contributed a series of articles, dealing mainly with artistic matters, to the *Universal Review*, most of which are now included in *The Humour of Homer, and other Essays* (1913). *The Humour of Homer* itself was a lecture delivered in 1892 to an audience of artisans. For the next five years Butler was much occupied with Homeric

questions, the numerous articles that he wrote upon the subject being finally merged in *The Authoress of the Odyssey* (1897), in which he proved to his own satisfaction that the poem was written at Trapani, in Sicily, by a young woman who depicted herself as Nausicaa. Meanwhile he had written a biography of his grandfather, the Bishop of Lichfield, *The Life and Letters of Dr Samuel Butler*, which gives a curiously interesting picture of the clerical and scholastic life of the early part of the 19th century, and, after studying music with the well-known theorist Rockstro, he had written and published, in collaboration with his friend Mr Henry Festing Jones, a cantata, in the Handelian style, entitled *Narcissus* (1888). This was followed by the posthumously published oratorio *Ulysses* (1904), in which also he had the advantage of Mr Jones's collaboration. Butler paid further tributes to the genius of Homer in prose translations of the *Iliad* (1898) and the *Odyssey* (1900), and he turned to a fresh field in his critical edition of Shakespeare's *Sonnets* (1899). Butler's last work revived memories of an earlier triumph. Thirty years after the appearance of *Erewhon* he published a sequel, *Erewhon Revisited* (1901), in which the hero, who at the close of the earlier work had escaped in a balloon, returns to find himself the central figure of a new religion founded upon the supposed miracle of his ascent to heaven. Even the natural disposition of mankind to find a sequel less interesting than its predecessor could not blind critics to the strength of *Erewhon Revisited*. As a work of art it is infinitely superior to *Erewhon*. The earlier book, written as it was at different times, pieced together by the hand of a literary novice, and dealing with subjects of various quality and interest, inevitably lacked regularity and cohesion. The later work is a more harmonious whole. The interest is concentrated upon a central idea, the story is developed with a firmer and more vigorous touch, and the writing has a maturer felicity of style.

Butler made little headway with the public during his lifetime. *Erewhon*, it is true, astonished and delighted the literary world, but *The Fair Haven* alienated the sympathies of the orthodox; *The Authoress of the Odyssey* repelled scholars, *Alps and Sanctuaries* and *Ex Voto* seriously flattered the artistic dove-cotes, and *Life and Habit* and its successors raised up powerful and relentless enemies in the field of science. During the greater part of his career Butler was a literary pariah, and his books were received with contemptuous silence or undisguised hostility. His reputation for irony did him harm with his contemporaries.

A humorist is not easily accepted as a teacher, and in an age of specialism Butler's versatility was an argument against him. It was often convenient for those who found his reasoning unanswerable to take refuge in the pretension that the author of *Erewhon*, whatever he chose to write about, was not to be taken seriously, and Butler, though he justly resented this attitude, could not resist the occasional temptation of playing into the hands of his opponents by juggling with paradoxes. His death was the signal for a remarkable turn in the tide of his popularity, and the completion of another decade saw him acclaimed as one of the most remarkable writers and thinkers of the latter part of the 19th century.

Butler's work is not easy to sum up in a word. He gave his own view of his life's achievement in a note which will be found in the posthumously published *Note-books of Samuel Butler*, p. 374, and is a sufficiently remarkable testimony to his energy and versatility. But the value of Butler lies in his destructive rather than in his creative work. His humorous philosophy is a potent, if

subtle, acid, under the action of which the priggishness and humbug of modern life dissolve into nothingness. Butler is the apostle of common-sense, the apologist of the *via media*. His genial Laodiceanism, however repulsive to the idealist, offers a practical, if somewhat inglorious, solution to many of the problems of life, and it is in such teaching as his that the conflicts of extremists find a tranquil reconciliation. See *Life* by H. Festing Jones (1919).

Butler, WILLIAM ARCHER (1814-48), religious and philosophical writer, was born at Annerville, near Clonmel. The child of a mixed marriage, he turned Protestant while still a schoolboy at Clonmel, and two years later entered Trinity College, Dublin, where he was appointed professor of Moral Philosophy in 1837.

Butler, LIEUT.-GENERAL SIR WILLIAM FRANCIS, K.C.B. (1838-1910), was born at Suirville in Tipperary, and became an ensign of the 69th regiment in 1858. He served on the Red River Expedition, was sent on a special mission to the Saskatchewan (1870-71), served in Ashanti (1873), in Natal (1879), and in the Sudan (1884-85). He had the Cape command in 1898-99, but was recalled before the war because his views on the Transvaal difficulty were not 'Imperialist'; and he retired from the Aldershot command in 1905. He wrote *The Great Lone Land* (1872), *Wild North Land* (1873), *Akimfoo* (1875), *Far Out* (1880), and *Lives of Gordon, Sir Charles Napier, and Pomeroy Colley*. In 1877 he married ELIZABETH SOUTHERDEN THOMPSON, born at Lausanne about 1843. She studied at home, in Florence, and in the School of Art, Kensington. Her first Academy picture, 'Missing,' was exhibited in 1873, and in the following year the 'Roll Call' established her reputation as a spirited and faithful painter of military subjects. Her 'Quatre Bras' (1875) drew praise from Ruskin. She has also illustrated poems by her sister, Mrs Meynell. See her *Autobiography* (1923).

Butlerage, otherwise called the *prisage* of wines, was a right exercised by the crown in England to take two tuns of wine from every ship (English or foreign) importing into England twenty tuns or more, which, by charter of Edward I., was

exchanged into a duty of two shillings for every tun imported by merchant strangers, and called butlerage, because paid to the king's butler.

Butomus, a genus of Butomaceae, an order of aquatic monocotyledons sometimes called Marsh-lilies, of which one species, *B. umbellatus*, is frequent in ditches and ponds in England, Ireland, and many parts of Europe. Some think it the most beautiful

Butomus.

of British plants. The leaves are all radical, 2 to 3 feet long, linear, triangular; their sharp edges sometimes cutting the mouths of cattle, whence the generic name (Gr., 'ox-cutting'). The flowering stem bears a large umbel of rose-coloured flowers, readily distinguished by their nine stamens,

six in pairs opposite the outer perianth, and three opposite the inner.

Butt, LAME CLARA, a popular singer with a remarkable contralto voice, was born at Southwick, 1st February 1873, and studied at the Royal College of Music. In 1900 she married the baritone, Kennerley Rumford (b. 1870).

Butt, ISAAC, a great Irish patriot, the first to make political use of the phrase 'Home Rule,' was the son of a Protestant rector, and was born in County Donegal in 1813. Educated at Raphoe and at Trinity College, Dublin, he gained a brilliant reputation for his accomplished scholarship, edited the *Dublin University Magazine* from 1834 to 1838, and filled the chair of Political Economy in his university from 1836 to 1841. He was called to the Irish bar in 1838, and ere long became a foremost champion of the Conservative cause, actively opposing O'Connell's Repeal Association in 1843. His political conversion occurred early, for in 1852 he was returned as a 'Liberal Conservative' for Youghal, for which constituency he sat until 1865. He defended Smith O'Brien and others in the state trials of 1848, and with equal fearlessness and self-devotion all the Fenian prisoners between the years 1865 and 1869. In 1871 Butt was returned for the city of Limerick to lead the Home Rule party, but soon found that he could not control them. He died 5th May 1879.

Butte, a mining city of Montana, U.S., 73 miles by rail SSW. of Helena. In the vicinity are numerous mines of gold, silver, and copper. Settled in 1864 as a placer-mining camp, Butte has a pop. of 42,000.

Butter is produced from milk by collecting the fatty globules contained therein and incorporating them in a solid mass, this being effected by mechanical means, as by the use of a churn. The mechanical action of the Churn (q.v.) overcomes the surface tension, which keeps the fat floating in the milk in the form of small globules, allowing these globules to coalesce. The composition of an average sample of butter is as follows: fat, 85 per cent.; water, 11.9 per cent.; casein and albumen, .6 per cent.; milk sugar, .5 per cent.; and ash and salt, 2 per cent. The government standard for butter forbids a greater percentage of water than 16. The butter fat is, again, composed of a number of separate fats or glycerides, the chief being Palmitin and Olein, these two making up over 70 per cent. of the total fat. The typical fats, however, which give to butter its distinctive character are Butyric and Caproic, these being present to the extent of 7.8 per cent. of the fat.

The following is the most economical way of producing marketable butter. The milk, on being drawn from the cow, is passed through a separator, which divides the cream from the skim-milk by the action of centrifugal force. In factories where large quantities of milk are dealt with the temperature at which separating is carried out is 125° F., but in small private dairies the milk is put into the machine at the body heat of the cow, care being taken that the temperature is not allowed to fall below 85° F. The cream, on being drawn from the separator, is placed in glazed earthenware crocks to ripen. Through ripening, a greater quantity of butter is produced from a given bulk of cream by decreasing the adhesive effect of the casein. The temperature at which the ripening-room should be kept is between 56° and 60° F. The process of ripening is brought about by the action of the lactic acid bacteria, and should be completed in about thirty-six hours in the case of a sample of cream from one separation. In small dairies the evening's cream is added to that produced in the morning, and so on for two or three days, until a sufficient

quantity is obtained for churning; under these conditions the ripening period is prolonged. The addition of each new lot of cream must be followed by stirring to give an even condition of ripeness to the whole. Under no circumstances should any cream be added within twelve hours of churning. In order to expedite ripening, a 'starter' in the form of a specially prepared culture of the lactic acid bacillus, which is a commercial article, may be used, or the same effect is produced by adding a little sour buttermilk from a previous churning.

Before putting the ripened cream into the churn, the latter must be prepared by washing—first with cold water, then with scalding water, and finally with cold, this last water being left in the churn for about twenty minutes, and run off before putting in the cream. The temperature of the churn will be roughly that of the air in the dairy, being usually about 56° F., and the cream should be at the same temperature when poured into the churn. The cream temperature may with advantage be slightly raised in winter and lowered in summer. The commonest type of churn at the present time is the so-called end-over-end churn, into which the cream is strained through a muslin, care being taken never to fill the receptacle more than half-full. The lid being fixed, the churn is now revolved, slowly, gradually increasing the speed to fifty revolutions per minute, slowing down again as the butter begins to 'break.' As a quantity of gas is liberated in churning, it is necessary to allow it to escape through a valve provided for the purpose. Under normal conditions the butter should 'break' in from twenty-five to thirty minutes, this being discernible by the clearing of a small glass indicator fitted in the lid of the churn. On the churn-lid being removed the butter will be found to be in the form of fine grains. In order to harden these a small quantity of water known as 'breaking water' is added, and a few more revolutions may then be given if the grain is very small. The buttermilk is now drawn off through a hair sieve, thus preventing the loss of any small particles of butter. This is followed by two or three washings, until the washing water comes away from the churn perfectly clear. The temperature of the washing water should be about 45° F. in summer and never below 50° in winter. The last washing water is not drawn off until the butter floating therein has been removed by means of a wooden scoop and hair sieve to the butter-worker. The butter-worker is briefly a sloping oblong table over which a fluted roller passes, the object being to expel from the butter the surplus water it contains. The butter, when dry and firm, is made up on a butter-board into various shapes, depending on the district, a common form being pound or half-pound rectangular blocks, wooden butter-pats (called 'Scotch hands') being used in the process.

Fresh butter contains no salt, but its keeping qualities are very limited. To increase the keeping capacity salt is added either by dry-salting or brining. In dry-salting, the purest salt is added to the butter when on the worker, at the rate of $\frac{1}{4}$ oz. per lb., and thoroughly incorporated. For brining, 1 or 2 lb. of salt is dissolved in 1 gallon of water, and this is used for the final washing in the churn, the butter remaining in it over half-an-hour.

In summer when butter is realising a low price it is sometimes advantageous to preserve or pot for winter use. In potting butter the following points should be particularly attended to: Wash very carefully when in the granular state in the churn, add salt on the worker at the rate of $1\frac{1}{2}$ oz. per lb., working thoroughly and giving the salt time to dissolve, being careful to expel as much of the moisture as possible; pack into glazed casks which have been thoroughly scalded and cooled,

consolidating the butter carefully to leave no air-spaces. A final layer of two inches of salt is placed on the top of the butter, and a vegetable parchment tied securely over all.

As butter is sometimes of a pale colour, artificial colouring may be resorted to, and this is best carried out by the addition of extract of Annatto (q.v.), which is added to the cream before churning and thoroughly mixed, the amount of extract used being $\frac{1}{2}$ to 1 drachm in three gallons of cream.

In place of using the separator as previously described, the cream may be obtained from the milk by setting in pans and allowing the action of gravity to leave the lighter cream on the surface of the liquid, whence it is removed by hand-skimming. This, together with the old-fashioned method of churning whole milk, is rapidly disappearing on account of the extra labour entailed and the loss of fat which is left in the milk.

The manufacture of butter in dairy factories (see DAIRY) is now becoming common in this country, the system having been in vogue for some time in America and Denmark. The handling of large quantities of milk on the co-operative system allows of the use of the best dairy machinery, and the subsequent production of butter which can be turned out in large bulk and of a uniform excellence of sample; whereas much variation is noticed when butter comes from a number of small private dairies.

BUTTERMILK is the residue of cream after the butter has been removed by churning, and it forms a wholesome, easily digestible, and nourishing drink in hot weather, possessing a slightly acid taste owing to the acidity developed in ripening the cream. It retains the ash casein and sugar of the whole milk, together with a small amount of fat left from the incomplete separation of the butter. Buttermilk is a valuable food for pigs, and on dairy-farms is largely used as such; in the household it is much in request for cooking purposes.—Less familiar is the artificially soured milk, rich in lactic acid, and recognised by Metschnikoff as valuable in intestinal disorders due to decomposition caused by bacteria, and in fermentative dyspepsia. The use was introduced into western Europe from Bulgaria about 1905.

A number of substitutes for butter are prepared from various animal and vegetable fats, which can only be distinguished from real butter by chemical analysis.—MARGARINE is an artificial butter which was first prepared in 1870 from the recipe of the French chemist Mège Mouriés, who devised the product to form a cheap substitute for butter for the poor of Paris. The fat from which this artificial butter was made was originally ox fat; but as the supply of this material failed to meet the demand owing to the increase in the manufacture of margarine, other animal and vegetable fats were made use of, such as pork fat, mutton fat, cocoa-butter (see COCOA), coconut oil (see COCONUT), olive-oil, cotton-seed oil, &c. There is of late a prodigiously increased demand in Europe for coconuts and coconut oil—no longer for the use of soap-makers mainly, but for the manufacture of margarine and butter substitutes (nut-butter, 'nutter,' &c.) for the table, for cooking and other domestic purposes, as well as for the use of biscuit-bakers and confectioners. In the manufacture of the best margarine beef fat is still largely employed, and the process is roughly as follows: The fat is first finely minced, then placed in jacketed tanks, and raised to a temperature of about 100° F. The fat is then skimmed, and the clear matter removed from the heavier portion, which remains at the bottom of the tanks. This clear material is subjected to pressure, which extracts the oils and leaves the harder fats. To this oily substance the name of oleomargarine is given, and it is mixed

with milk and annatto as a colouring ingredient, and the mixture churned at a high speed. The margarine is then cooled with water at a low temperature, and subsequently put through rollers to expel moisture, dry salt being added during the working process. The percentage of insoluble fatty acids is considerably higher in margarine than in butter, although the total fat content of the two is practically identical. Margarine, when carefully prepared, forms a safe and cheap substitute for butter; but its use as an adulterant in the genuine article, and its sale as butter, had a depressing effect on the dairy industry. To prevent products not prepared entirely from cow's milk being sold as butter or butterine, the Food and Drugs Acts of 1887, 1899, and 1907 forbid the sale of artificial butters except in properly stamped cases marked 'Margarine,' while the amount of butter fat and water contained in the preparation may not exceed 10 per cent. and 16 per cent. respectively. All premises where margarine is prepared must be registered and open to inspection.

In America the Oleomargarine Law (1886) forbids the sale of any mixtures of animal and vegetable fats except under the name of Oleomargarine.

In chemistry 'butter' is used not merely of such substances as the oils of palm, coconut, shea, nutmeg, &c., but of certain oily metallic substances—thus we have butter of Antimony (q.v.), of bismuth, zinc, and tin.

Butter-bur (*Petasites vulgaris*) is a perennial Composite, common in wet meadows and beside streams, whose huge simple and somewhat rhubarb-like leaves form a very characteristic foreground in such landscapes. The whitish-purple flower-heads, borne in exuberant racemose masses, come up like those of its ally Coltsfoot (*Tussilago*, q.v.), in early spring, before the leaves. *P. fragrans*, or Winter Heliotrope, has bluish flower-heads.

Buttercup is a name given to various species of *Ranunculus* (q.v.).

Butterfield, WILLIAM (1814-1900), called 'the Fra Angelico of Architecture,' excelled in Gothic, with colour by means of brick, stone, marble, and mosaic. The best-known works by him are Keble College, Oxford; St Augustine's College, Canterbury; the Chapel and Quadrangle of Rugby; All Saints', Margaret Street, London; and St Albans, Holborn.

Butterfish. See GUNNEL.

Butterflies, or RHOPALOCERA, a series of Lepidoptera mostly diurnal in their activity, in contrast to the Moths (q.v.) or Heterocera, most of which fly in the twilight or at night. Butterflies may be fairly called the favourite insects; the ravages committed in their caterpillar stage seem absolved by the grace and beauty of their adult life; the contrasts of their life-history have formed the subject of oft-repeated parables; the richness and variety of their colouring make them at once the cruel delights of boyhood and the living jewels of the artist; their thousand variations have for long afforded scope for the unwearying labours of the entomologist; while their ethereal winged beauty has appeared to many a poet fitly symbolic of the human soul.

Zoological Position.—The Lepidoptera form one of the highest orders of insects, with these general characters—there are four wings covered with flat scales often beautifully coloured; the veins or nervures are not numerous; the mouth-parts of typical adults are most conspicuously represented by a coiled protrusible proboscis, but the larva has biting mandibles; there is an abrupt and complete metamorphosis, the Caterpillar (q.v.) stage being succeeded by a quiescent pupa, out of which the imago or winged adult emerges. They

are almost exclusively vegetarian insects, and depend on the fluid parts of what they eat. In many cases the feeding is practically confined to the larval stage. There are probably some 50,000 species, the British list by itself numbering about 2000. They are often unscientifically divided into Macro- and Micro-lepidoptera, and there is not much scientific value in the division into butterflies and moths. The former usually have the antennae knobbed or thickened a little before the tip; the latter have the antennae of various shapes, very rarely knobbed, usually thread-like, spindle-shaped, or feathery. Moreover, most of the moths have a 'frenulum,' consisting of one or more bristles, on the hind wing anterior to the insertion, and linking on to a flap or tuft on the fore wing. It may be noted that butterflies form a much more natural assemblage (excepting the Hesperidae or Skippers) than do the moths, which are very heterogeneous. There are believed to be about 13,000 species of butterflies, and about 70 in Britain.

Structure.—Butterflies vary in spread of wing from under an inch to about eight inches (in some female Ornithoptera). The characteristic flat scales to which the name Lepidoptera refers (*lepis*, 'a scale'; *pteron*, 'a wing') are modified setae or hairs of various shapes, and are arranged on the wings somewhat like the scales on a roof. Their colouring is usually due to contained pigment (sometimes of the nature of waste-products) and to fine surface striations which produce 'interference' or iridescent effects. Scales may occur along with hairs on the body, and there are all transitions between hairs and scales. In many male butterflies certain scales (androconia) on the wings produce fragrance, which is sometimes like flower-perfume and probably attractive. Sometimes, especially in large, conspicuous, slowly flying butterflies, very repulsive odours, probably of protective value, are produced by both sexes from special patches of scales or from the general wing surface. The head bears large compound eyes and frequently a pair of well-hidden simple eyes on the dorsal surface. The knobbed antennae and the typical coiled proboscis (due to the outer parts of the first maxillae) have been already referred to. The mandibles are absent or vestigial; the labial palps are usually well developed. Some butterflies use their proboscis to suck up fluid food, such as nectar from the flowers; others seem hardly to eat at all. There is a very small collar-like prothorax, a very large mesothorax, and a smaller metathorax, all free from one another. The long slender legs are covered with scales, and the tibiae of the front pair often show on their inner aspect a peculiar mobile pad. The relatively large wings have few nervures (not exceeding fifteen at the periphery), and there is usually but one 'cell' (an area completely enclosed by nervures). In flight the fore and hind wings act as one, the anterior part of the hind one being overlapped by and pressed against the posterior part of the fore one. The abdomen has as usual nine or ten segments, but only six or seven are readily seen. As to the internal structure,

Fig. 1.—Mouth Parts of Cabbage Butterfly (after Leunis):

a, suctorial tube formed from first pair of maxillae; b, the labial palps belonging to the second pair of maxillae. At the base of the former, hints of upper lip, mandibles, and part of second maxillae can be seen.

The mandibles are absent or vestigial; the labial palps are usually well developed. Some butterflies use their proboscis to suck up fluid food, such as nectar from the flowers; others seem hardly to eat at all. There is a very small collar-like prothorax, a very large mesothorax, and a smaller metathorax, all free from one another. The long slender legs are covered with scales, and the tibiae of the front pair often show on their inner aspect a peculiar mobile pad. The relatively large wings have few nervures (not exceeding fifteen at the periphery), and there is usually but one 'cell' (an area completely enclosed by nervures). In flight the fore and hind wings act as one, the anterior part of the hind one being overlapped by and pressed against the posterior part of the fore one. The abdomen has as usual nine or ten segments, but only six or seven are readily seen. As to the internal structure,

it is not markedly divergent from that of typical insects. The supra- and sub-oesophageal ganglia are coalescent; the three thoracic ganglia are close together; and there are four ganglia in the abdomen. There is at the beginning of the abdomen, in front of the stomach, a blind sac which appears to be a food-storing reservoir. There are six excretory or Malpighian tubes and complicated reproductive organs.

Sexes.—In many cases the males are more brilliant than the females, the disparity reaching a climax in such genera as *Papilio* and *Ornithoptera*. Thus of *O. parcalisea* found in New Guinea Dr Sharp writes: 'The female is a large sombre creature of black, white, and gray colours, but the male is brilliant with gold and green, and is made additionally remarkable by a long tail of unusual form on each hind wing.' In some cases, however, e.g. *Colias erusa* in Britain, and in many species of *Pieris*, the female excels the male in colouring; in many cases the two sexes are alike. Mr J. T. Cunningham calls attention to the interesting and probably important point that 'in a large number of instances the difference in coloration between male and female of the same species is precisely of the same kind as the difference between the upper and lower surfaces of the wings in the individual.' Darwin regarded the diverse coloration of the sexes in butterflies as in great part the outcome of sexual selection, the females being supposed to give a constant preference to the more brilliant males. Wallace, on the other hand, regarded this view as unsupported by evidence and as also quite inadequate to account for the facts. In

with a head and thirteen segments, with biting mandibles, with three pairs of jointed thoracic appendages and a number of more fleshy abdominal 'prolegs.' The caterpillars feed voraciously, grow quickly, and moult their cuticle several times. Finally they pass into the quiescent pupa or chrysalis stage, during which the larval body is metamorphosed into that of the winged butterfly. There is a process of histolysis, or breaking down of tissue, and of histogenesis, or establishment of new tissue—the plan or architecture of the body being thus profoundly altered. The wings are formed at the end of the caterpillar stage, but are fastened down to the body by a glutinous secretion which forms a shell over the chrysalis. There is usually a posterior terminal projection called the 'cremaster' or anal armature, to which silk threads are often attached, which bind the pupa to a support or allow it to hang freely. There may also be a silk thread girdling the middle. In the Skippers (Hesperiidae) the caterpillars conceal themselves in caves of leaves, and the pupa is similarly sheltered. It may also form a rudimentary cocoon, which is very rare among butterflies. The adult that emerges from the pupa skin has its wings soft and crumpled, but they soon expand and become firm. The butterfly's life is usually short, and there is sometimes more than one brood in the course of the year.

Seasonal Dimorphism.—In some cases the generation developed at one season is markedly different in coloration and outline from that developed at another season. There may be summer and winter forms, or 'wet' and 'dry' season forms; and these have been repeatedly referred to different species.

In the European form *Araschnia* (or *Vanessa*) *levana-prorsa*, the *prorsa* generation flies about in the summer; its progeny pass the winter as pupæ and hatch out in spring as a *levana* generation. Weismann and others have proved that an artificial change of temperature during the pupal stage will change the characters of the resulting butterfly. Thus what should emerge a *prorsa* will, in artificial cold, become a *levana*. Weismann suggested that during the glacial ages there was probably only the *levana* form, and that the summer form *prorsa* has been evolved since. In the North American *Papilio ajax* (see fig. 2) there are three forms—*P. ajax*, *P. telamonides*, and *P. marcellus*. The offspring of *P. ajax* spend the winter as pupæ; those that emerge early (before the middle of April) are of the form *mar-*

Fig. 2.—Seasonal Dimorphism—Two forms of the same species (*Papilio ajax*):

a, var. *telamonides*, b, var. *marcellus*.

many cases the females show no hint of choosing; in many cases the males follow their desired mates and above them, so that, as a matter of fact, the brilliant upper surface of the male cannot be seen by the female; in many cases what enhances the sex-attraction on both sides seems to be odour, not colour. Wallace inclined to regard the bright colours of many male butterflies as physiological concomitants of their greater vigour as compared with the females. The whole question remains under discussion. It may be suggested that masculine and feminine peculiarities began as variations in males and females respectively and are sex-linked, being physiologically compatible with the one sex or the other, but not with both.

Life History.—The eggs, which differ considerably in shape, have chitinous shells often beautifully sculptured. They are usually deposited singly here and there, but sometimes there are many close together. They are generally laid on the leaves or branches of those plants on which the caterpillars feed. Out of the egg there emerges a small Caterpillar (q.v.), smooth, hairy, or spiny,

cellus; those that emerge late (between the middle of April and the end of May) are of the form *telamonides*. Those butterflies that appear later in the summer are of the *ajax* type. There is much that is both interesting and puzzling in seasonal dimorphism; thus it has been shown in some cases that each form is particularly well adapted to particular conditions. In one of the leaf butterflies, *Kallima parulekta*, the dry season appearance is borne by the females and the wet season appearance by the males.

Protective Coloration.—There is considerable variability in the colouring of butterflies, and according to Darwinian interpretation this has supplied the material on which natural selection has persistently operated until at last there resulted such perfect protective resemblance as we see in various species of *Kallima*, the Dead-Leaf Butterfly (see fig. 3). In this genus the upper surface of the wings, conspicuous during flight, is brightly coloured; the under surface, exposed when the butterfly settles down and folds its wings together vertically above its body, is like a withered

leaf, not only in general, but in detail, decayed spots included.

Sometimes the coloration is modifiable, rather than variable. That is to say, it changes according to external influences—e.g. of temperature, illumination, or humidity. This has been proved experimentally in a number of cases, and it holds of some caterpillars and pupæ, as well as of adults.

Mimicry.—Many butterflies are like unrelated species, and this is interpreted on the theory of mimetic resemblance. A palatable species may

Fig. 3.—*Kallima Inachis* (from Carus Sterne):
a, flying; b, at rest.

escape being eaten if it resembles an unrelated nauseous species living in the same locality (Batesian mimicry). Or a number of inedible unrelated forms may be profited if they resemble one another, the theory being that the mimicry spreads the risk of being eaten by birds, and that it enables the birds more readily to master the association of a particular type of coloration with unpalatability (Müllerian mimicry). In some cases there is a very interesting resemblance between butterflies and insects of another order altogether; thus one of the Skippers has a curious resemblance to a grasshopper of the genus *Tettix*. The facts of mimicry are very striking, and often very puzzling on any theory. The whole question remains under consideration (see MIMICRY). Sometimes there are extraordinary complications. Thus Poulton gives examples showing that the male and female of a mimetic species may resemble different models; that the male may resemble one model, and two kinds of female two others; that a non-mimicking male, e.g. *Papilio dardanus* (*merops*), may be accompanied by two, three, or even four forms of female mimicking different models.

Distribution.—The occurrence of plants suitable for the caterpillars must obviously be an important factor in determining the geographical distribution of butterflies, but they are represented in every part of the globe. South America is richest of all, and New Zealand poorest. Gerstaecker notes that at a single point in Brazil three times as many butterflies occur as in the whole of Germany, and Wallace declared that it used to be possible to collect 600 different kinds of butterflies around the city of Pará. In the North Polar regions explorers have captured various species, several belonging to genera (*Colias*, *Argynnis*, *Lycæna*, &c.) common in the temperate zones. Even in the short summer of Greenland and Spitsbergen butterflies occur. Heilprin notes that M. Bonpland observed butterflies on the slopes of Chimborazo, at an elevation of 16,626 feet. Some gorgeous forms found in tropical America and elsewhere are remarkable not only as 'the most splendid insects in creation,' but on account of their migrations. In his work on Ceylon,

Sir James Tennent describes 'the extraordinary sight of flights of these delicate creatures, generally of a white or pale-yellow hue, apparently miles in breadth, and of such prodigious extension as to occupy hours and even days uninterruptedly in their passage, whence coming no one knows, whither going no one can tell.'

Bates found 550 distinct species of butterflies at Ega in the Upper Amazon country. Eighteen species of the swallow-tail genus (*Papilio*) were found within ten minutes' walk of his house. 'The number and variety of gaily tinted butterflies, sporting about in the grove on sunny days, were so great that the bright moving flakes of colour gave quite a character to the physiognomy of the place. It was impossible to walk far without disturbing flocks of them from the damp sand at the edge of the water, where they congregated to imbibe the moisture.' The gay individuals were almost all males, and 'every afternoon as the sun was getting low, the gaudy sunshine-loving swains might be seen trooping off to the forests, in the shades of which their more soberly dressed and immensely less numerous sweethearts and wives were confined.'

Hooker, describing the scenery on the banks of the Great Runjeet in the Sikkim Himalaya, says that 'by far the most striking feature consisted in the amazing quantity of superb butterflies, large tropical swallow-tails, black, with scarlet or yellow eyes on their wings. They were seen everywhere, sailing majestically through the still, hot air, or fluttering from one scorching rock to another, and especially loving to settle on the damp sand of the river-edge, where they sat by thousands, with erect wings, balancing themselves with a rocking motion, as their heavy sails inclined them to one side or the other, resembling a crowded fleet of yachts on a calm day.'

Classification.—Butterflies have been classified in various ways, but in recent arrangements particular attention has been paid to the character of the front pair of legs (which are often smaller than the others and different in shape), the claws on the feet, the nature of the tibia, and so on. The following six families are often recognised: (1) *Nymphalidæ*, including the many sub-families, the *Danaids*, e.g. the *Danaus*; the *Ithomiids*, e.g. *Ithomia*; the *Satyridæ*, e.g. the British Meadow-browns, Heaths, and Marbled-whites; the *Morphids*, e.g. the giant *Morpho*; the *Brassolidæ*, e.g. the giant *Caligo*; the *Acraeids*; the *Heliconiids* of tropical America, very modifiable in their colouring; the *Nymphalids*, e.g. the Peacock, the Red Admiral, the Tortoise-shells, the Painted Lady (*Pyraus cardui*), 'the most ubiquitous of the butterfly tribe, the Purple Emperor (*Apatura iris*), the Dead-leaf Butterfly (*Kallima*); (2) *Erycinidæ* or *Lemoniids*, with one species in Britain, the Duke of Burgundy Fritillary (*Nemeobius lucina*); (3) *Lycenidæ* or *Blues*; (4) *Pieridæ*, e.g. Garden-white, Brimstone, Clouded-yellow, and Orange-tip; (5) *Papilionidæ*, e.g. many magnificent species of *Papilio* and *Ornithoptera*; (6) *Hesperiidæ* or *Skippers*, the most distinct of the butterfly-families, with somewhat hook-shaped antennæ, with a peculiar jerky flight, with larvæ as well as pupæ concealed, and often with crepuscular habits.

Biological Importance.—The old butterfly-collecting was more a matter of æsthetic than of scientific enthusiasm, but to the modern naturalist the various species are much more than beautiful curiosities to be named and pinned—they are emblazoned pages in the history of nature's processes. 'This tribe,' Bates wrote, 'is better adapted than almost any other group of animals or plants to furnish facts in illustration of the modifications which all species undergo in nature, under changed local conditions.' The simplicity and obtrusive-

ness of the specific characters, the large number of species, the facility with which series of specimens can be collected and compared, account for this superiority. 'It may be said that on the expanded membranes of the wings nature writes, as on a tablet, the story of the modifications of species, so truly do all changes of the organisation register themselves thereon. Moreover, the same colour-patterns of the wings generally show, with great regularity, the degrees of blood relationship of the species. As the laws of nature must be the same for all beings, the conclusions furnished by this group of insects must be applicable to the whole organic world; therefore the study of butterflies—creatures selected as the types of airiness and vivacity—instead of being despised, will some day be valued as one of the most important branches of biological science.' On many of the deepest questions of biology—such as variation, modification, heredity, sex-dimorphism, adaptation—the study of butterflies has thrown and continues to throw much light.

Brief notices of a few of the principal kinds of butterflies will be found in other parts of this work. See CABBAGE-BUTTERFLY, CAMBERWELL BEAUTY, MIMICRY, PURPLE EMPEROR, &c.

Literature.—Bates, *Naturalist on the Amazon* (as to mimicry); Poulton, *Essays on Evolution* (1903) (as to mimicry); Darwin, *Descent of Man*, chap. xi. (as to sexual selection); Wallace, *Darwinism* (as to coloration); Weismann, *Studies on Theory of Descent* (1880) (seasonal dimorphism); Poulton, *Colours of Animals* (1890); Beddard, *Animal Coloration* (1892); Weismann, *The Evolution Theory* (1904) (coloration); S. H. Sendder, *Butterflies*, (New York, 1881) and *Butterflies of New England* (1889); Humphreys and Westwood, *British Butterflies and their Transformations* (1841); D. Sharp, *Cambridge Natural History*, vol. vi. (1899); Ch. Janet, *Les Papillons* (Paris); M. Standfuss, *Handbuch der palaarktischen Gross-Schmetterlinge* (Jena, 1896). For British butterflies one of the most convenient books is South's (1906). A great work on European butterflies is Herrich-Schäffer's *Systematische Beschreibung der Schmetterlinge von Europa* (5 vols.), and on tropical Lepidoptera, *Exotische Tausfalter* (3 vols.) by Staudinger, Schatz, and Rober (1884-1887).

Butterfly Fish. See BLENNY.

Butterfly Orchis (*Oncidium Papilio*), an orchid of Trinidad and Venezuela, of which the flowers have an extraordinarily close resemblance to a brown-spotted yellow butterfly. It is a frequent inmate of our hothouses. *Phalenopsis amabilis* is also sometimes called Indian Butterfly Orchis.

Butterfly Weed, or PLEURISY ROOT (*Asclepias tuberosa*, see ASCLEPIAS), a plant common in the United States, of which the root has medicinal repute, the infusion being used as a diaphoretic and expectorant.

Butterine, Buttermilk. See BUTTER.

Buttermere, a Cumberland lake, 9 miles SW. of Keswick. Lying 329 feet above sea-level, it is $\frac{1}{2}$ mile long, $\frac{1}{2}$ mile wide, 94 feet deep, and is united by a short stream to Crummock Water (321 feet, $2\frac{1}{2}$ miles by $\frac{1}{2}$ mile, 144 feet deep), which discharges into the Cocker.

Butternut (*Juglans cinerea*), a North American species of Walnut (q.v.).

Butter-rock, or HALOTRICHITE, is an iron alum, appearing as a pasty exudation on rocks that contain Alum (q.v.) or its constituents, particularly alum-slate and other schistose rocks.

Butter-tree (*Bassia*) is a genus of tropical or subtropical trees of the natural order Sapotaceæ (q.v.), remarkable for the abundance of oil or butyrous fat which the seeds contain, and which is used for many purposes by the inhabitants of the countries where they are indigenous.—The Mahwa or Mowra of India (*Bassia latifolia*) attains a height of 40 to 60 feet, like a good oak in size, and

is a valuable timber-tree. Its flowers last two or three weeks, and then fall; they are eaten raw, and have a luscious taste when fresh; when dry, they resemble figs in flavour. They are a valuable source of food, especially in the Central Provinces, and a kind of arrack or spirit is distilled from them. Alcohol for power purposes can be got from them in great quantities, and very cheaply. They may also be employed as a very abundant source of sugar. One tree may produce 800 lb. of flowers. The seeds of the apple-like fruit yield by expression a considerable quantity of a greenish-yellow fat, which is used for the manufacture of margarine, soap, and candles, for burning in lamps, and occasionally by the poorer classes for frying food.—The Indian Butter-tree, or Phulwara or Fulwa Tree (*B. butyracea*), a native of Nepal, attains a height of 50 feet. Its timber is light and of no value. The fruit is of the size of a pigeon's egg, and although eaten, is not much esteemed; but from the seed a fat or butter is obtained by expression of a delicate white colour, much valued for medicinal uses and as an unguent, and employed also to adulterate ghi.—The seeds of the Illupi (*B. longifolia*), of Coimandel, yield a large quantity of oil, which is used for lamps, for making soap, candles, and chocolate, and in cookery. The flowers are eaten, and the wood is almost as hard and durable as teak.—The butter-tree (*Butyrospermum Parkii*) described by Mungo Park as growing in the interior of Africa, in the country of Bambarra, is nearly allied. It produces the Galam Butter, also called Shea Butter (i.e. Tree Butter), which is highly valued, and forms an important article of internal commerce in the interior of Africa. The seeds of the fruit, which resembles an olive, are dried in the sun, or in a peculiar kind of oven, and the kernels are then boiled in water in order to obtain the butter from them, which not only keeps for a whole year without salt, but is also said to be whiter, more solid, and more pleasant to the taste than true butter. This butter is used both as an article of food and of medicine, and it would seem that the tree would reward cultivation elsewhere in the tropics.—The name Butter-tree is also given to other tropical trees, whose fruits yield fixed oils, having the appearance and used for the purposes of butter. Thus the butter-trees of Guiana and Brazil belong to the genus Caryocar (q.v.), of Caryocaraceæ, the West African butter-tree to the genus Pentadesma, of Guttiferæ (q.v.). The Oil-palms (q.v.) and the *Cocos butyracea* (see COCONUT) may also be regarded as butter-trees. See also TALLOW-TREE.

Butterwort (*Pinguicula*), a genus of Lentibulariaceæ (q.v.), small plants with a characteristic rosette of large spreading entire radical leaves, common in bogs and marshes. The Common Butterwort (*P. vulgaris*) is abundant in the northern parts of Britain and of Europe, and grows in Canada. Its leaves are covered with sessile and stalked glands, which yield a viscous insect-catching secretion (hence *pinguicula*, 'greasy'), which also contains acid and

Common Butterwort
(*Pinguicula vulgaris*):
a, a flower.

pepsin, and has active digestive properties (see INSECTIVOROUS PLANTS). Hence it has also the power of coagulating milk, and is used for this purpose by the Laplanders. Some species possess flowers of much beauty, especially *P. grandiflora*. *P. lustranica*, found on the W. coasts of Britain, has migrated from Portugal.

Buttmann, PHILIPP, was born at Frankfort in 1764, and studied at Gottingen under Heyne. He became in 1789 assistant in the Royal Library at Berlin, and rose successively to be secretary and librarian (1811). He held at the same time (1800-8) a professorship in the Joachimsthal Gymnasium in Berlin. He died 21st June 1829. Buttmann is best known by his Greek grammar (1792; 22d ed. 1869) and *Leucoquus* (2 vols. 1818-25; 2d ed. 1860), both of which have been translated into English.

Buttons. A button is a disc, generally circular, prepared to attach to clothing, other textiles, and to leather, for fastening edges or for ornamentation. Buttons are made from innumerable materials and combinations, and their methods of manufacture and ornamentation are as varied as the materials from which they are made. Whilst defying classification, three groups may be distinguished by their methods of attachment to clothing: first, buttons sewed on through their substance, such, e.g., as linen-covered metal rings used for underclothing; second, buttons pierced with two or more (generally four) holes through which they are sewed, of which trouser-buttons are a type; and, third, buttons having tangs or tabs on their under side for attachment. A further trade distinction is drawn between military, naval, livery, and other uniform buttons, generally of stamped metal, and the endlessly varied buttons of civil life.

Button-making as an industry does not date farther back than the days of Queen Elizabeth, and in England Birmingham has always been its principal seat. In the 18th century the trade, chiefly in brass and gilt metal buttons, attained great prosperity, and about the same time costly steel buttons, brilliantly cut and faceted, came into great vogue. Matthew Boulton, subsequently partner with James Watt, was a maker of these costly steel buttons. Early in the 19th century Mr B. Sanders introduced the cloth-covered button, which initiated the change from those made of metal. His son in 1825 effected the improvement of making it with a canvas tuft instead of a metal shank, which does less injury to the garment. The shell, consisting of two discs of thin metal, the cloth covering in front, the canvas on back to form the tuft, and the millboard stuffing, together make up a covered button. All these parts are circular and separately punched out of sheets. In the punching of the front metal disc its periphery is at the same time turned up. The back disc or collet is made in a similar manner, but a hole is made in the centre of this to let the tuft or flexible shank protrude. All the component parts being ready, a workman using a press with a punch and die unites them firmly together. He first covers the front part of the shell with the silk, and subsequently, by the introduction of a round steel tool into the press, he unites this with the collet and its accessories.

In 1841 the old Dorsetshire wire and thread button was replaced by the 'three-fold linen button,' still considered indispensable for underclothing, since neither washing nor mangling quickly destroys it. The linen covering of this button is held fast by the pressed-down edges of a groove in its internal brass ring.

Soon after coloured tweed coats began to be worn, in the 19th century, brass buttons of an

ornamental kind were used for them. Heads or entire figures of animals, for example, were stamped upon the buttons, and they were bronzed (see BRONZING) in various tints to match approximately the colour of the cloth. Except for livery servants and other special purposes, it is chiefly trouser-buttons that are now made of metal. These are largely produced from rolled sheet brass. The blanks are punched out either by a hand or steam press and are afterwards stamped, which operation depresses the centre and thickens the margin. The holes are also punched out.

Buttons of Vegetable Ivory (q.v.), the fruit of *Phytelphas macrocarpa*, called commercially corozo nuts, are now all but universally used for tweed coats and vests. It is not unlike true ivory but softer, and is easily turned and dyed. These buttons are often mottled with some stain to suit the common patterns of tweed stuffs. Thousands of tons of corozo nuts are consumed every year in the manufacture of buttons, especially in Italy and Czechoslovakia. The seeds of the dum palm are not so good for button-making. Various kinds of wood, such as beech, box, rosewood, lignum-vite, zebra-wood, and walnut are manufactured into buttons. Wood moulds or cores for ladies' buttons, which are covered with cloth of the same pattern as a dress, are made in enormous numbers in the south of France.

Mother-of-pearl buttons are formed of the beautiful substance of which the large flat shell of the pearl-oyster consists, and this has long been a favourite material for buttons. Small cylinders are first cut out of the shells with a tubular saw. These are then split into discs, which are shaped by a steel tool, drilled with holes, and finally polished with rotten-stone and soft soap, or by a more recent method with ground charcoal and turpentine. Shirt-studs as well as flat and globular buttons with metal shanks are also made of this substance. See PEARL.

Among other animal substances used for buttons are ivory, bone, horn, and hoof. From this last so-called 'horn buttons' were made by pressing them in heated dies in which the design was cut. There are many kinds of composition buttons, as of Celluloid (q.v.), ebonite, &c.

Glass buttons are made in great variety. For 'pinched' buttons small rods of coloured glass are heated at the ends, and pressed into shape by means of a pair of rather long hand-pliers, on the ends of which are a die and its counterpart, likewise kept hot. Other kinds are cut out of coloured sheet-glass, which is coated on the back with tin-amalgam like a mirror. Along with other varieties, some beautiful glass buttons are made in Bohemia, either partly or wholly of aventurine glass; and of this 'gold'-spangled material artistically wrought with other colours, studs and solitaires still more remarkable for their beauty and minute patterns are made at Venice.

Porcelain buttons, at one time nearly all of French manufacture, are now made principally at Prague. Some are plain, and others are painted or printed with patterns.

The mandarins' buttons of China are official badges worn in the caps of state officials. There are nine grades in each branch of the public service, and each grade is distinguished by a different colour or other marking of the button.

More or less expensive buttons are made of ornamental stone, such as agate, jasper, and malble. Occasionally they are formed of amber, jade, or of still more costly materials, as pearls and gems. As to other materials, a Birmingham manufacturer says it were easy to write out a long list from which buttons have been made, but very difficult to name one from which they have not been made.

In recent years improved methods and machines have been introduced for the shaping as well as for the polishing and finishing of bone, corozo, and wood buttons. Machinery is used in Germany for the manufacture of composition buttons, and there is an American machine for performing automatically all the operations in manufacturing covered buttons.

In England, Birmingham is the seat of the button trade, which, however, is much more largely developed in France. But both countries suffered in the competition in the markets of the world with Austria. In the United States

buttons are principally made at New York and Philadelphia.

It is only rarely that a button is a thing of beauty apart from the material of which it is made. The annexed illustrations, however, show two of silver filigree as worn on dresses in Norway (a) and Iceland (b), which have some claim to artistic merit, and the third (c) represents one of many Japanese buttons or *netsukes*, in which the skill and fancy of a true artist is still more apparent.

Buttonwood. See PLANE.

Buttress, a projection for the purpose of giving additional support or strength to a wall. In the classical style there were no visible buttresses, their structure being, to a certain extent, supplied or concealed by pilasters, antæ, &c. The different stages of Gothic architecture are marked by the form of buttresses employed, almost as distinctly as by the form of the arch. In early Romanesque the buttresses frequently presented the form of a pillar, after the tradition of classic art. The Norman buttress was generally broad, with slight projection, and finished on top with a splay against the wall; but it was also occasionally semicircular, like a half column applied to the wall. Early English buttresses project much more boldly, and are considerably narrower than the Norman. They are frequently broken into stages, which diminish in size as they ascend. In the Decorated style, this division into stages is almost invariable, the buttress being often supplied with niches terminating in pinnacles, and very highly ornamented with carving, statues, &c. In the Perpendicular style they frequently assume more fantastic forms, sometimes presenting a sharp external angle and being adorned with applied pinnacles, &c. Flying buttresses are half arches thrown from detached piers or buttresses against the upper parts of vaulted structures in order to abut and carry off the outward pressure of the arches. This expedient for supporting lofty vaults was first invented in France in the 12th century.

It became one of the chief factors in the growth of the Gothic school, and, crowned with lofty pinnacles, the French buttresses formed one of

Buttresses, Amiens Cathedral:
a, buttresses; b, flying buttress.

the principal decorations of the exterior of French cathedrals. They were introduced into England at the period of the Early English.

Butua Root. See PAREIRA BRAVA.

Butyl. See ALCOHOL.

Butyric Acid, C_3H_7COOH , is a volatile fatty acid, first prepared by Chevreul, by treating butter with an Alkali (q.v.). It possesses the disagreeable odour of rancid butter, and it is to it, in part at least, that the perspiration of animals owes its unpleasant smell. It is a mobile liquid, specific gravity .974, the vapour of which is inflammable, burning with a blue flame. It is readily soluble in water and alcohol, possesses a sour burning taste and corrodes the skin.

While butyric acid itself and its inorganic salts (butyrates of sodium, calcium, &c.) have a disagreeable smell, it is interesting to note that the organic salts (butyrates of methyl, ethyl, &c.) have a pleasant odour, and are used in the manufacture of artificial fruit essences.

The principal source of the acid is from *butyric fermentation*. To a solution of glucose, sour-milk, cheese, and chalk are added, and the mixture kept at a temperature of 35° C. Ferments in the cheese and milk cause fermentation of carbohydrate. As the acid is formed it is neutralised by the chalk, as otherwise an accumulation of acid would arrest fermentation. By treating with hydrochloric acid and then distilling, butyric acid is separated.

Butyric Ether, or PINE APPLE OIL, is an exceedingly fragrant oil obtained by distilling butyric acid (or the butyrate of lime), alcohol, and sulphuric acid. The material which passes over is the butyric ether, and it is generally mixed with alcohol, and sold in commerce as *Artificial Pine-apple Oil*. It possesses the same very pleasant flavour which belongs to pine-apples, and there is little doubt that pine-apples owe their flavour to the presence of natural butyric ether. The artificial variety is now extensively used for flavouring confections, as pine-apple drops, for sophisticating

bad rum, and for flavouring custards, ices, and creams, as also an acidulated drink or lemonade named Pine-apple Ale. Butyric ether alone cannot be used in perfumery for handkerchief use, as, when inhaled in even small quantity, it tends to cause irritation of the air-tubes of the lungs and intense headache, but it is employed as one material in the manufacture of compound perfumes. Butyric ether is the butyrate of ethyl, $C_2H_5COO \cdot C_2H_5$, and is similar to butyrate of sodium, $C_2H_5COO \cdot Na$, in composition, the sodium, Na, being in this case replaced by the organic radical ethyl, C_2H_5 . It is remarkable that a substance possessing such a disagreeable odour as butyric acid should be capable of forming, in part at least, a substance with such a pleasant flavour as artificial pine-apple oil.

Butyrospermum. See BUTTER-TREE.

Buxar, or BAXAR, a town of Shahabad district, Bihar, on the south bank of the Ganges, 411 miles NW. of Calcutta by rail. It has a large central jail where tents are manufactured. Here in 1764 Sir Hector Munro defeated a confederation of Hindu princes under Mir Kassim. Pop. 10,000.

Buxbaumia, a small genus of mosses. *B. apophylla*, very rare in Britain, is remarkable for its exceedingly reduced scaly leaves.

Buxton, a town in Derbyshire, 37 miles NW. of Derby, and 25 SSE. of Manchester. It lies 1025 feet above sea-level, in a deep valley surrounded by hills and moors, which have been tastefully planted; and the only approach is a narrow ravine, by which the Wye flows into the Derwent. Chee Tor, 5 miles to the east, is a perpendicular limestone rock rising to a height of 300 feet from the Wye, while 3 miles to the south-west is Axe Edge (1810 feet). Buxton has long been famous for its calcareous springs, tepid (82° F.) and cold (discharging 120 gallons of water per minute), and its chalybeate springs. They were probably known to the Romans, and in 1572 were celebrated by one Dr John Jones as 'the ancient baths of Buckstones.' The town is visited both in summer and winter by many thousands of persons, the waters being taken for indigestion, gout, rheumatism, and nervous and cutaneous diseases. The Devonshire Hospital (claiming to have the widest dome in Europe) treats thousands of poor patients with the waters every year. The baths and public walks are numerous. Much of the splendour of Buxton is due to the dukes of Devonshire, one of whom in 1780, at the cost of £120,000, erected an immense three-storied pile of buildings called the Crescent, a curve of 200 feet, with wings each of 58 feet. It includes several hotels, a town-hall and free library (1891), assembly rooms, &c. Near Buxton are the Diamond Hill, famous for its crystals; and Poole's Hole, a stalactite cavern of great length. Mary, Queen of Scots, was at Buxton when in the custody of the Earl of Shrewsbury. Pop. (1871) 3717; (1881) 6021; (1921) 15,651.

Buxton, SIR THOMAS FOWELL, philanthropist, was born in 1786 at Earls Colne, Essex. Educated at Kingston, and under Dr Burney at Greenwich, from 1803 to 1807 he studied with brilliant success at Trinity College, Dublin, whilst his youth was distinguished by a strong development of animal energy, natural enough to a young Englishman whose full stature exceeded 6 feet 4. In 1807 he married a sister of the celebrated Mrs Fry, and in 1808 entered business as a brewer, with an energy which in due time was crowned with splendid prosperity. His warm religious and moral impulses soon brought him prominently forward as an advocate of philanthropic interests. The relief of the Spitalfield weavers and the reform of prison discipline formed early subjects of his efforts. In 1818 he entered parliament as member for Wey-

mouth, which he continued to represent till 1837, taking a prominent part in every debate on such questions as the amelioration of criminal law and prison discipline, suttee abolition, and slave emancipation. The last in particular engrossed a large share of his activity for many years. In 1824, at Wilberforce's request, he succeeded him as head of the anti-slavery party; and no man on that side displayed more indomitable zeal and firmness. He lost his seat through his opposition to bribery, and refused ever after to stand for a constituency. His philanthropic labours, however, ended only with his life. In 1840 he received the well-merited distinction of a baronetcy. He died 19th February 1845, and a statue has been erected to him in Westminster Abbey. See *Memoirs of Sir T. Fowell Buxton* (1848), edited by his third son, Charles (1823-71), who sat in parliament as an independent Liberal from 1857, and who, like his father, was a partner in the brewery of Truman, Hanbury, Buxton & Co.

Buxtorf, JOHANN, Hebraist, was born in 1564 at Kamen, in Westphalia; in 1591 became professor of Hebrew at Basel, and died there of the plague in 1629. In a knowledge of rabbinical literature, he surpassed all his contemporaries. The most important of his numerous works, the *Lexicon Chaldaicum Talmudicum et Rabbinicum*, was completed by his son (Basel, 1640), and has been recast by Fischer and Gelbe (2 vols. Leip. 1866-74). See Life by Kautzsch (1879).—His son, JOHANN, was born at Basel in 1599, and at five years of age—according to his rather credulous biographers—could read German, Latin, and Hebrew. To perfect his knowledge of these tongues he visited Holland, France, and Germany; and in 1630 he succeeded his father in the chair of Hebrew at Basel, where he died in 1664. He published a number of treatises, commentaries, and translations. His son, Jakob (1645-1704), and his nephew, Johann (1663-1732), both succeeded to the Hebrew professorship.

Buxus. See BOX.

Buying of Pleas by lawyers, explained under the English term CHAMPARTY, to which it is analogous, is prohibited by an old Scots act passed in 1594.

Buys-Ballot, CHRISTOPH HEINRICH DIEDRICH, meteorologist, born at Kloetingen in Zeeland, 10th October 1817, studied at Utrecht, where he became professor of Mathematics (1847) and of Experimental Physics (1870), and in 1854 director of the Royal Meteorological Institute. He was one of the initiators of the system under which, by daily weather reports, and by simultaneous observations at numerous stations by land and by sea, materials are collected for forecasting changes, and his labours contributed materially to the determination of a general law of storms (see STORMS). The inventor of the Aeroklinoscope (q.v.), and of a system of weather signals, he successfully promoted international uniformity in meteorological observations. He died on the 3d February 1890. His works include *Changements périodiques de la Température* (1847); *A Uniform System of Meteorological Observations* (1873).

Buyuk'dereh, on the Bosphorus, 10 miles NNE. of Constantinople, was the summer residence of many of the ambassadors.

Buzau, BUZEU, or BUSEO, the capital of a Rumanian district, 75 miles SW. of Galatz, has petroleum springs; pop. 30,000.

Buzzard (*Buteo*), a genus of birds of prey, in the family Falconidae, having a rather small and weak bill, which bends from the root, and is not notched as in falcons. The 'cere' is bristly, except

between the nostrils. The portion of the leg just above the foot is not feathered. Buzzards may be regarded as an inferior kind of eagles, which they do not equal in courage or strength. They are large birds, the Common Buzzard

(*B. vulgaris* or *fuscus*) measuring almost 4 feet from tip to tip of its outstretched wings. It is a bird still frequent in Britain, though much less so than it formerly was. It is subject to great variations of plumage; the prevailing colour is brown, with a considerable mixture of black on the upper parts, and of white or grayish white on the under.

Common Buzzard (*Buteo vulgaris*).

It is sluggish and inactive in comparison with many other birds of the same family, and is usually slow in its flight. It often sits long on a tree, watching for prey. When occasion presents it glides silently into the air, and sweeping rapidly down, seizes its victim in its claws. Sometimes, however, it ascends to a great height in the air. This buzzard is plentiful in all the wooded parts of Europe; it is found also in the north of Africa, and is known to exist in the western parts of Asia; but it is doubtful how far it extends over that continent, a distinct although very similar species occurring in the Himalaya Mountains. It is a most useful bird of prey, feeding to a large extent on mice, also on adders and the like. Thirty field-mice have been taken from the crop of a single bird. It is of use too in killing off sickly birds. The nest is built on a tree or rock, or a crow's nest may be utilised. The nest is rough, and composed of sticks and grass. The eggs are three or four in number, and usually bluish white with reddish blotches. Tame female buzzards have been known in several instances to exhibit so strong a propensity for incubation and the rearing of young at the proper season, that they have hatched hens' eggs and brought up the chickens, although if chickens not of their own hatching were brought within their reach, they devoured them. Meat given to the buzzard nurse was carefully divided among her nurslings, but they found out by their own instincts the use of grain and other vegetable food. In Sweden they are often caught for food.—The Rough-legged Buzzard (*Archibuteo lagopus*) is very similar to the former, but is at once distinguished by having the lower portion of the leg feathered to the toes. It is a rarer British bird, yet not of unfrequent occurrence; it is very widely diffused, being found in the Old World from Lapland to the Cape of Good Hope, and equally common in the northern parts of North America. It is very sluggish, and is most frequently to be seen in marshy districts, and often skimming over marshes, where it makes prey of frogs.—The Red-tailed Hawk of North America is a buzzard (*Buteo*—according to some *Falco borealis*), in very bad repute among American farmers and housewives for its frequent invasion of poultry-yards, from which it has acquired the name of *Hen-hawk*.

—Several other species appear to be limited to particular parts of the world, as the handsome *Buteo jackal*—so called from its voice—to South Africa. See also HONEY BUZZARDS, HARRIERS (for the Marsh Harrier or *Moor Buzzard*), and OSPREY for the *Bald Buzzard*.

Byblis, a genus of Lentibulariaceæ (often referred to Droseraceæ), consisting of two tropical Australian species, herbs or undershrubs, which capture insects by means of stalked and sessile glands like those of the Butterwort (q.v.).

Byblos, an ancient city of Phœnicia, now a village called Jubel, on a shallow bay at the base of the lower range of the Libanus, about half-way between Tripoli and Beyrout. Byblos was famous as the birthplace of Adonis or Tammuz, of whose worship it became the centre; and many devotees were also attracted to the splendid temple of Astarte erected here. The Jews called the town Gebal, and its inhabitants are noticed in the Bible as stone-squarers and calkers of ships. A ruined wall belonging apparently to the era of the Crusades surrounds the town, and Roman and earlier remains are still visible.

Bydgoszcz, the Polish name of Bromberg (q.v.).

Byelaya-Tserskov, a town of Ukraine, 50 miles SSW. of Kiev; pop. 60,000.

Byelgorod. See BELGOROD.

Byelostok. See BIALYSTOK.

Byeltsi, or BALTI, a town of Rumania, in Bessarabia, 65 miles NW. of Kishinev; pop. 25,000.

By-laws are rules or regulations made by corporations, railway or other public companies, or local authorities. The term, indeed, is frequently used in a wide sense to designate orders or rules issued by any authority subordinate to parliament. A by-law regularly made by a subordinate authority, in exercise of a power expressly or impliedly conferred, has the force of law within the sphere of its legitimate operation. Thus all regulations made by a corporate body, and intended to bind not only themselves and their officers and servants, but members of the public who come within the sphere of their operations, may be properly called 'by-laws.' The power to make by-laws is usually given in express terms by the charter creating a corporation; and, if such power is not expressly conferred, the corporation nevertheless has an implied power to make by-laws for all purposes within its charter. The power of making by-laws, for definite purposes and within prescribed limits, has been freely conferred by statute on local authorities and public companies. In most cases, however, such by-laws must be confirmed by some central authority. Thus, under the Municipal Corporations Act, 1882, the council of every borough has power 'to make such by-laws as to them seem meet for the good rule and government of the borough, and for the prevention and suppression of nuisances not already punishable in a summary manner by virtue of any act in force throughout the borough.' Such by-laws must be submitted to a Secretary of State, and may be disallowed by order in Council. A county council has the same power to make by-laws within the county as the council of a borough has within the borough; but the by-laws of a county council are not operative in any borough. Additional powers of making by-laws have been conferred on various local authorities by the Public Health Acts, the Education Acts, the Weights and Measures Acts, and other modern statutes. By-laws made by local authorities relating to public health are supervised by the Ministry of Health, which has a series of model by-laws for the guidance of local authorities. Again, all railway companies

and many other public companies—e.g. canal and dock companies—are empowered to issue by-laws for the regulation of their undertakings. Certified copies of the by-laws and regulations made by a railway company must be submitted to the Board of Trade, and may be disallowed by that Board. A by-law, though bearing to be issued under statutory authority, and though sanctioned by the appointed central authority, may nevertheless be invalid, if it goes beyond the powers conferred, or is repugnant to the general law of the land, or is unreasonable in itself. In recent years parliament, to a constantly increasing extent, has by statutes conferred on departments of state and other bodies powers to issue general rules and orders on particular subjects. Thus the Ministry of Health, the Board of Trade, the Board of Agriculture and Fisheries, and other public departments exercise wide delegated powers of legislation, and in many cases the orders and rules issued under these delegated powers are equivalent in force to statutory enactments. Similarly, under the Judicature Act, 1881, a committee of judges has power to make rules regulating the procedure in the High Court of Justice, and the rules so made, which are known as 'Rules of the Supreme Court,' are of great importance, and have all the force and effect of statutes.

In Scotland the powers of corporations to issue by-laws are similar to those obtaining in England, and powers to make rules and regulations have been freely conferred by various statutes on local authorities, public companies, and other bodies on the same general lines as in England.

In the United States the term 'by-laws' is applied to ordinances made by a corporation for its own government. Any such ordinance is invalid if it is contrary to the laws of the state in which the corporation is situated.

Byng, GEORGE, VISCOUNT TORRINGTON, admiral, was born in 1663 at Wrotham, Kent, and entered the navy at the age of fifteen. In 1688 he recommended himself to William of Orange by his activity and zeal in attaching the officers of the fleet to the cause of the Revolution, and was advanced to the rank of captain. Made rear-admiral of the red in 1703, he next year captured Gibraltar, and for his gallant conduct at the sea-fight of Malaga was knighted by Queen Anne. In 1708 he became admiral of the blue, and commanded a squadron fitted out to oppose an intended invasion on the part of the Pretender. He pursued the French fleet to the Firth of Forth, took one ship, and forced the rest back to Dunkirk. For his services during the '15 he was created a baronet; and in 1718 he commanded the English fleet sent to Sicily for the protection of the neutrality of Italy, on 31st July utterly destroying the Spanish fleet off Messina. Soon after, he was appointed treasurer of the navy and rear-admiral of Great Britain. In January 1721 he was sworn of the Privy-council, and in September created Viscount Torrington. On the revival of the Order of the Bath, in 1725, he was installed one of the knights; and, on the accession of George II., became First Lord of the Admiralty. He represented Plymouth in parliament from 1706 until 1721. He died 17th January 1733.

Byng, JOHN, an ill-fated British admiral, fourth son of the preceding, was born in 1704, entered the navy at fourteen, in 1727 was appointed to a frigate, and for the next eight years served mainly in the Mediterranean. Rear-admiral in 1745, he went as second in command to the Mediterranean in 1747, but the death of Vice-admiral Medley soon gave him the chief command, which he retained until the peace. In March 1756 he was promoted to be admiral of the blue, and sent in command

of a poorly equipped squadron to relieve Minorca, blockaded by the French under La Gallissonnière. Byng, on the 20th May, gave the signal to engage the enemy's fleet, almost equal in number of ships and weight to his own. The van under Rear-admiral West at once bore down on the French ships, which stood entirely on the defensive, but the rear, under Byng, got into some disorder and hardly came within gunshot. The van suffered great loss, and Byng, feeling himself unable to renew the action, after a council of war, sailed away to Gibraltar and left Minorca to its fate. When the news reached England the public became furious, and the ministers, to avert the public odium from themselves, ordered the unfortunate Byng to be at once brought home under arrest. He reached the Spithead on the 26th July, and was confined at Greenwich until his trial by court-martial began five months later. He was acquitted of cowardice or disaffection, but was found guilty of neglect of duty in not having done everything in his power to save Minorca, and was condemned to death by the 12th article of war, but recommended to mercy. The king refused to pardon him, and Byng was shot on board the *Monarque* at Portsmouth, 14th March 1757, 'to encourage the others,' in Voltaire's phrase. He met his fate with great courage. See *Papers relating to the Loss of Minorca in 1756*, ed. Richmond (Navy Rec. Soc., vol. xlii. 1913).

Byng of Vimy, JULIAN, first VISCOUNT (1926), British general, was born 11th September 1862. Joining the 10th Hussars in 1883, he served in the Sudan, in South Africa, and in Egypt. During the Great War he saw service in France and Gallipoli, becoming lieutenant-general in 1915, when he was also knighted, and general in 1917. He commanded successively the 3d cavalry division (1914), the cavalry corps (1915), the 9th, 17th, and Canadian corps (1916), and the 3d army (1917). Amongst much distinguished service his advance on Cambrai, November 1917, is most noteworthy. Raised to the peerage in 1919, he was Governor-general of Canada in 1921-26.

Bynkershoek, CORNELIS VAN (1673-1743), a Dutch jurist, who in 1724 became president of the Supreme Court of Holland. He wrote in Latin on Roman law, public law, and Dutch law; his complete works were published at Geneva in 1761, and at London in 1767.

By-products. See WASTE PRODUCTS; also ANILINE, COAL-TAR, PARAFFIN, SODA, SULPHURIC ACID, &c.

Byrd, BIRD, or BIRDE, WILLIAM, the greatest musician of the Tudor school, was born in 1543, probably at Lincoln. He may have studied under Tallis. He became organist of Lincoln in 1563, and, though a recusant, was appointed a gentleman of Queen Elizabeth's Chapel-royal in 1569, sharing with Tallis the honorary post of organist. In 1575 he was granted, along with Tallis, a twenty-one years' monopoly to print and sell music. He died in 1623. Byrd, with his *Psalms, Sonnets, and Songs* (1588), *Songs of Sundry Natures* (1589), *Psalms, Songs, and Sonnets* (1611), was the founder of the English madrigal school. His compositions, also, for the virginal were not to be 'mended by the best Italian of them all.' Byrd's church music, however, represents his finest work. It consists of two books of *Sacrae Cantiones* (1589, 1591), two of *Gradualia* (1607), three masses, and, as with his secular music, many compositions in manuscript. The well-known canon *Non Nobis, Domine*, has been attributed to him. 'Never without reverence to be named of the musicians,' Byrd has been regarded by some as the greatest English composer of all time. See a study (1923) by E. H. Fellowes, who edited his madrigals in *The English Madrigal School* (1921,

vols. xiv., xv., xvi.); the Carnegie United Kingdom Trust's edition of Tudor music gives two volumes to his church music; the first appeared in 1922.

Byrd, WILLIAM (1674-1744), an American author, born at Westover, Virginia, studied law in England, took a prominent part in colonial affairs, and became president of the council. His narratives of journeys show wit, urbanity, and a sense of style unusual among Virginians of his time. His *Writings* were edited by J. S. Bassett (1901); his letters were published in 1916.

Byrgius, JUSTUS, or **JOST BÜRGI**, the inventor of various astronomical instruments, was born in 1552, at Lichtensteig, in the Swiss canton of St Gall. In 1579 he entered the service of the learned Landgrave of Hesse, Wilhelm IV., and in 1604 that of the Emperor Rudolf II. His first work was a celestial globe, in which the stars were placed according to his own observations. He died in 1633. Many of his reputed discoveries and inventions are questioned, such as those of logarithms and the proportional compasses. See his *Life* by Gieswald (Danzig, 1856).

Byrlaw (also **BIRLAW** or **BURLAW**), the name given to a sort of popular jurisprudence formerly in use in Scotland, in villages, and among husbandmen. Sir John Skene, writing in 1597, when the system was in full force, defines byrlaw as '*leges rusticorum, de re rustica late*—laws made by husbandmen, concerning neighbourhood to be kept among themselves.'—*Reg. Majest. lib. iv.* As the byrlaw was enacted by the common consent of the villagers or neighbours, so it was administered by judges chosen by them from their own ranks. These judges were commonly called 'byrlaw men,' a name which is still applied in some parts of Scotland to an arbiter, oddsman, or umpire. The courts which they held were called 'byrlaw courts,' and took cognisance of disputes between neighbour and neighbour. Byrlaw seems to be an interesting survival of the system of the ancient Aryan village community, or, at least, an illustration of the principle of visnet, voisinage, or neighbourhood, on which many early institutions were founded. The word is perhaps from Norse *bygr*, gen. of *byr*, 'town.'

Byrom, JOHN, poet and stenographer, was born at Broughton, near Manchester, February 29, 1692. From Merchant Taylors' School he passed to Trinity College, Cambridge, where he took his B.A. in 1712, and two years later was elected to a fellowship. He next travelled, studied medicine at Montpellier, and returned to London to make his bread by teaching a new system of shorthand he had invented at Cambridge. In 1740 he succeeded to the family estates, and in 1742 obtained from parliament the sole privilege for twenty-one years of teaching his system. He maintained friendship and a correspondence with many great contemporaries, and his diary gives us interesting glimpses of Bentley, Bishop Butler, Samuel Clarke, Wesley, and William Law. He died 26th September 1763. The Chetham Society published his diary (2 vols.) in 1854-57; his poems in 1894 *et seq.* His system of shorthand was first published in 1767, at Manchester. It is clear, characterised by 'simple strokes and no arbitrary characters,' but cannot be written with sufficient rapidity, and consequently has long since been superseded by swifter systems. His poems were first collected in 1773. They show dexterity in rhyme and a fine vein of genial satire. Byrom was throughout life a sound Jacobite, and one of his epigrams which reveals this, in spite of its sly safety, has survived:

God bless the King, God bless our faith's defender,
God bless—no harm in blessing—the Pretender;
But who pretender is, and who is king,
God bless us all! that's quite another thing.

Byron, GEORGE GORDON, sixth LORD, was born in Holles Street, Cavendish Square, on the 22d of January 1788. His mother was Catherine Gordon, heiress of the Gordons of Gight; his father was John Byron, nephew of the fifth or 'wicked' Lord Byron, and son of Admiral John Byron (1723-86), who sailed round the world with Anson, or rather who did not sail round, being wrecked in the *Wager*, and subjected to various hardships, of which he wrote a classical account. The admiral was then only a midshipman, and though, in a day when officers were habitually tyrannical, he was mild-mannered as well as gallant, his continual bad luck with the elements made him shunned by sailors much later as 'Foul-weather Jack.' The poet's maternal ancestry hardly belongs directly to this article; it is sufficient to say that it is indissolubly connected with the whole of Scottish history from James I. downward. On the father's side, though there was a blot in the middle of the pedigree (John Byron in the middle of the 16th century being described as *filius naturalis*, and inheriting by deed of gift, not in the ordinary course), the family was hardly less distinguished, and, as far as certain history goes, older. The Buruns, or Byrons, appear immediately after the Conquest as holding lands in most of the northern counties of England, especially Lancashire, Nottingham, and Derby. The chief family estates in the first-named county were acquired by marriage as early as the 12th century; the still more celebrated estate of Newstead was abbey land, and was given to Sir John Byron by Henry VIII. at the dissolution. Although the Byrons appear often in earlier history, it was not till the 17th century that they gained their principal distinction. They were strong royalists, and the Sir John Byron of the day was created Lord Byron of Rochdale, where the Lancashire estates lay, in October 1643, with special reference to services at Newbury. The next noteworthy holder of the title was the already mentioned wicked lord, who, like his brother, was in the navy, who escaped almost by accident the wreck of the ill-fated *Victory* on the Caskets, and who fought under very questionable circumstances, in a private room of a tavern in Pall Mall, a duel with his Nottinghamshire neighbour, Mr Chaworth. Chaworth was killed, and Lord Byron was tried (1765) for murder, but was found guilty only of manslaughter, and escaped with a nominal penalty. He was generally unpopular, and seems to have been decidedly mad; but his madness was very inconvenient for the Byron family, inasmuch as he sold, on a doubtful title, the Lancashire estates, which were much the most profitable part of the property. He did not die till ten years after the poet's birth, and the dilapidation of the property was partly excused by the fact that Captain John Byron, his heir, was at least as great a rascal as himself, without any apparent excuse of madness or ill-luck. This Captain Byron, the poet's father, seduced, borrowed money from, eloped with, married, and ill-treated the Marchioness of Carmarthen; the only offspring of this marriage who lived being Augusta, afterwards Mrs Leigh. Then John Byron, after his first wife's death, married Catherine Gordon, whose fortune he spent, and whom he would probably have ill-treated if she had not been at least as great a vixen as he was a rascal. The memorable picture of Mrs Cadurcis in Lord Beaconsfield's *Venetia* seems to be hardly too harsh for Mrs Byron, who on all occasions seems to have been absolutely incapable of what is commonly called ladylike demeanour. In very early youth the poet (who was born with a club-foot, the source of constant moral torture to him, though it is said that but for his own morbid consciousness it would have passed almost unnoticed) saw something of his father's and mother's quarrels.

His early life was mostly passed at Aberdeen. At Lord Byron's death in 1798 (John Byron had fortunately died seven years before), Mrs Byron and her son removed to England, and in 1801 Byron was sent to Harrow, whence in 1805 he proceeded to Trinity College, Cambridge. He had become at his great-uncle's death a ward of chancery, and Lord Carlisle, a second cousin and an amiable person of some literature, was appointed his guardian. But probably no guardian under heaven could have satisfied Byron's irritable vanity, and the two did not get on well together. The anecdotes of the Harrow and Cambridge career are sufficiently numerous, but there is no room for them here. They are more consonant than usual with the future character of the man, showing a strong individuality, great though as yet unformed and entirely undirected talent, combined with a curious pride of station most unusual in one of such descent on both sides, and rather suggesting the vanity of a parvenu. The most interesting by far of these early incidents is the poet's 'calf-love' (as cruel custom calls it) for Mary Chaworth, heiress of his great-uncle's victim, and a very beautiful girl two years his senior. It is impossible to say how much merely romantic and fanciful sentiment entered into this affection, which as a poet he afterwards commemorated or created in immortal verse. But if it really was love, Miss Chaworth seems not to have returned it, and before Byron went to Cambridge she married John Musters, a mighty hunter of the neighbourhood. The marriage was not happy; but it is doubtful whether she envied Lady Byron. At Cambridge Byron spent the greater part of three years, and made many friends (the most important of whom was the late Lord Broughton), besides keeping a bear, and perpetrating other follies excusable enough. His vacations were spent partly in London, more largely at Southwell, where his mother had taken a house. It was from this time that Byron's habit of accusing himself of all sorts of wickedness in letters began, a habit which has prejudiced against him not merely those who take his letters as true, and are shocked, but also those who know them to be exaggerated, and are disgusted. His first work, *Hours of Idleness*, to which he had privately given circulation under the title of *Juvenilia*, appeared in March 1807. This is probably the worst first book ever written by a considerable poet, and it was savagely 'cut up' in the *Edinburgh Review* exactly a year later. There is no doubt that this attack did Byron good; but his rejoinder was by no means so rapid and careless as he would have liked it to be thought. He took nearly as long to concoct *English Bards and Scotch Reviewers* as his reviewer had taken before the attack appeared; and meanwhile (in the earliest spring of 1809) he came of age, resolved to keep up Newstead (a very difficult thing with his dilapidated fortune, even if he had been a more careful man), and took his seat in the House of Lords. He published *English Bards*, an imitative but, in its way, capital Popian satire, and soon afterwards (in June 1809) started for a grand tour, which, owing to the continental war, had to be of a somewhat different character from the regular grand tour of the preceding century.

He first sailed from Falmouth to Lisbon, and then after brief visits to Spain and Malta, made his way to Greece, where (in the large sense of the Greek countries round the *Ægean*) he spent the greater part of two years. There is no doubt that this visit 'made' Byron. His powerful and original faculties were associated with a strange bent towards the conventional and the commonplace, and it required something absolutely new, something of which the average Englishmen knew nothing, to awake his spirit. At this time the remoter parts of Europe

were much less familiar to Englishmen than the Niger or the Rio Negro are now, and the medicine exactly suited the patient. Almost immediately after his return, and before he had time to reach her deathbed, his mother died, and his most intimate friend Matthews was drowned at Cambridge within a week. It will always be one of the capital anecdotes illustrating the insensibility of authors to their own strength and weakness, that Byron, whose *English Bards* had been very successful, intended to bring out on his return certain *Hunts from Horace*, which are only a little better than the *Hours of Idleness*; and when asked by his friend Dallas if he had nothing else, produced, as a 'lot of Spenserian stanzas' not worth troubling anybody with, the first two cantos of *Childe Harold*. Gifford and Murray, to whom Dallas showed these, at once saw their merit, but the poem was not issued rapidly; indeed, Byron was by no means the rapid writer or issuer that he would have seemed. He had much disagreeable business, for, as has been mentioned, his affairs were wretchedly involved, by no means owing to his own fault wholly. He renewed acquaintance and began affection with his sister Augusta, spoke sometimes in the House of Lords, and went much into society; but neither now nor at any time did he like England, where the life was too uniform to suit him, and where he was not nearly monarch enough of all he surveyed to please him. Even he, however, can hardly have been disappointed at the success of *Childe Harold*, which, appearing on the 20th of February 1812, had, before the end of March, run through seven whole editions. Byron's admirers had now no cause of complaint as to his slowness in publication. Besides smaller pieces, the *Graour* and the *Bride of Abydos* appeared in the same year (1813), the *Cor-sair*, *Lara*, and the *Hebrew Melodies* in 1814, the *Bride of Corinth* and *Parisina* in 1815. He said he wrote the *Cor-sair* (of which the public bought 14,000 copies in a day) in ten days, and the *Bride of Abydos* in four; but remarks of Byron's of this kind are not to be taken too literally. During these years he was the darling of society, knew almost every one in London who was worth knowing, and was the object of the maddest devotion from many women, notably Lady Caroline Lamb. On 2d January 1815, to the surprise of all and the consternation of a few, he married Anne Isabella Milbanke, heiress in her own right of the barony of Wentworth and of a considerable fortune. His daughter Ada was born in December 1815, and in January 1816 Lady Byron left her husband's house for ever.

Hardly any recent event, not concerning politics or religion, has ever exercised pens and tongues like this. Neither party immediately concerned ever gave to the world an authoritative version of the circumstances which led to it, and though there are many contradictory assertions on the subject, it is doubtful whether there is even in unpublished documents any quite satisfactory evidence. Forty-five years after the poet's death, Mrs Beecher Stowe informed the world that Lady Byron (then dead) had informed her that the separation was due to her discovery of a more than sisterly affection between the poet and his sister Augusta. But proof on three points—that Lady Byron told Mrs Stowe this; that Lady Byron, if she told Mrs Stowe so, believed it; and most important of all, that Lady Byron, if she believed it, had any ground for believing—is wholly wanting; and the relations between Lady Byron and Mrs Leigh subsequent to the separation are hopelessly incompatible with the story. Among those who have dealt specifically with these subjects are Mr Jeaffreson, Lord Lovelace, and Mr Edgumbe; for their contributions see the paragraph at the end of this article. The

judgment of the wisest as to the separation itself has never varied much—That nothing further need be sought than the natural incompatibility of a spoiled dandy and author of loose habits, violent temper, and pecuniary circumstances likely to produce perpetual irritation, and a spoiled heiress of exceptionally cold temperament, and of orthodox and even prim manners and notions. The blame was in all probability equally divided, but it was not equally apportioned; and Byron, after being a popular favourite for three years, was held up to such obloquy in newspapers and by society, that he left England and never returned.

He first went up the Rhine to Switzerland, where he met the Shelleys, with whom he connected himself by friendship with the poet, and more questionably by a liaison with Jane or Claire Clairmont, daughter of the second Mrs Shelley's stepmother by her first husband. He went on in a leisurely manner to Venice, which he reached at the end of the year, and which was his headquarters for some two years. His life at this time and place has been represented as one of wild debauchery, principally on the always untrustworthy evidence of his own assertions and hints. It is certain, however, that at the end of 1818 he entered upon a comparatively regular existence by becoming the accepted lover in Italian fashion of the Countess Teresa Guiccioli. During 1819 and 1820 he was living for the most part in her society at Ravenna. In the summer of the latter year he removed to Pisa; in 1822 he was present at Shelley's funeral, and engaged (an engagement which showed neither to advantage) with Leigh Hunt in the *Liberal*. From Pisa a further move was made in 1822 to Genoa. It was here, in 1823, that he received the proposals which enabled him to crown his life with a death not unheroic. He had always been a nominal, though a very unclassified, Liberal, and had latterly engaged in some Carbonari plots in Italy. He was now applied to through his friends Kinnaird and Hobhouse to join the movement for recovering the independence of Greece, and he set out for Greece itself on the 14th July 1823. But many weary months, spent chiefly in the Ionian Islands, passed before he could get into active work; nor was the delay in any way his fault. At last he landed at Missolonghi on the 5th January 1824; laboured with more difficult, if less showy, heroism than if he had been storming Turkish castles, against bad weather, disunion among the Greeks, lack of material, and all tiresome checks; caught rheumatic fever, and died on the 19th April. His body was brought to England, and buried in the church of Hucknall-Torkard, near Newstead. His literary activity since he left England had been very great. The stimulus of his wife's desertion produced almost immediately two short poems, *The Dream* and *Darkness*, which were, perhaps, his poetical high-water mark. In the course of the seven years he completed *Childe Harold*, wrote a series of dramas or dramatic poems (*Manfred*, *Cain*, *Marino Faliero*, *Sardanapalus*, and others), which contain much of his most characteristic work; and produced, besides the wonderful bravura of *Mazeppa*, the cleverness of *Beppo*, and other things, the vast satiric medley of *Don Juan*.

The character of Byron, his genius, and the history of his literary reputation, are all subjects of great interest. In his own day, and immediately afterwards, his 'morality,' in the limited sense in which that word is popularly used, was the principal subject of discussion, and was most harshly judged. Recently it has been admitted: (1) That his education and circumstances supply a large palliation for faults of this kind; (2) that his own habit of fanfaronade exaggerated his moral delinquencies; and (3) that all faults of such

a kind (for Byron, though a libertine, is never accused of treachery or cruelty in his libertinism) concern posterity but little. If, however, this side of his character has been more leniently judged, another side has been judged with increasing unfriendliness, and the poet's pride and vanity of birth (displayed in a manner to which the term 'snobbishness' is almost applicable), his alternations of ostentatious prodigality and sharp business practice, his childish vanity of all kinds, have received perhaps not undue, but certainly severe treatment.

In regard to his literary genius, English critical opinion steadily sank from the date of his death, and though efforts have from time to time been made to set him on a higher position, the attempt has not as yet received either critical or popular approval. Every competent critic admits Byron's power. At his best he could utter what he himself had actually seen and felt with an energy not surpassed by any writer of any period in any language. For passion of a certain kind, and for picturesqueness of a certain kind, he is almost unequalled. But this merit of personal utterance involves almost of necessity two defects—complete failure when he endeavoured to portray anything besides his own personal emotions and experiences, and not infrequent insincerity and theatricality when, in default of actual emotion and experience, he endeavoured to simulate such experience and emotion. For he was not a man of many-sided mind or even feeling. The monotony of the Byronic hero—the man of dark imaginings, universal disillusion, and general contempt of man—but especially of woman-kind—is freely granted; yet the poet can write of little or nothing else, and as soon as the type ceases to be impressive it becomes ridiculous. A second great objection to Byron is his extraordinary weakness as regards all the formal merits of poetry. Hardly a long passage, certainly no long poem, of his can be cited which, after brilliant images, forcible expressions, and melodious verse, does not break down into the most commonplace thought and phrase, the most inharmonious rhythm, even into sheer bellman's rhyme and kitchenmaid's grammar. Accordingly his most uniform strength is to be found in his satirical work, which of its nature suffers less from these defects than serious or romantic verse. Byron had no humour; but he had a most keen, abounding, and versatile wit of a somewhat Voltairian character, but richer and more poetical than Voltaire's in quality, so that *Don Juan* ranks far above the *Fuente*. He attempted no serious prose; but his letters, though somewhat artificial, are of singular excellence; indeed they are perhaps of their kind the best in English.

His poetical influence in his own country for a time swept all before it, but is now almost non-existent. Abroad, on the contrary, it long maintained itself or even increased, and the dictum attributed to Mazzini, that Byron 'made English literature European,' received confirmation. Few foreigners are in a position to seize the subtle formal defects, which, for all but the most uncritical English readers, mar every page of Byron's work. All are able to appreciate the strong points noted above, points in which, as has been said, Byron has few, if any, rivals in his strength. Some at least of his weaknesses even appealed to Continental opinion. His irreverence, his contempt for propriety, his open-mouthed egotism, his language about women, his theatricality, never shocked Frenchmen, Italians, and Germans as they—formerly, at least—shocked his own countrymen. Political causes assisting, and a considerable literary movement breaking out in all European countries at the beginning of the second quarter of the century, Byron attained the surest of all positions

of influence, that of influencing those who influence their own countrymen. Hugo, Delavigne, De Musset, De Vigny, Flaubert, and the whole Romantic school in France, Lenau and Heine to a certain extent in Germany, Pushkin and Lermontoff in Russia, Espronceda in Spain, Byronised *ad libitum*; while the poet was a main inspiration to many Italian writers, and shared with the classics the credit of producing Leopardi. Perhaps also Byron's ostentatious affectation of being un-English helped to create and preserve his popularity with the world from which Englishmen are still so sharply divided.

The history of Byron's Life by Moore (2 vols. 1830) is curious. Byron gave his own Memoirs to Moore, and that poet sold them in 1821 to Mr Murray for £2000. Objections on the part of Lady Byron and others were raised to their publication, and in 1824 the manuscript was burned, Moore refunding the purchase-money, but receiving a still larger sum for the Life, in which such of the matter of the Memoirs as was deemed prudent was worked up with letters and personal reminiscences. According to Lord Broughton, all Byron's friends, except perhaps Moore, thought the Memoirs should be burnt, for the sake of Byron's reputation. As to the separation, Mr J. C. Jeaffreson in *The Real Lord Byron* (1883) failed to solve the mystery or contribute any information of real value. Between 1905 and 1910 the matter was revived again by Lord Lovelace, Mr Richard Edgewcombe, and others in the books and articles cited below. The first-named, in his *Astoria*, supported the Stowe charge, Mr Edgewcombe, while denying this, imported new scandal into the affair concerning Byron's relations with his early love, Mary Chaworth, as Mrs Musters; while the belated publication of Lord Broughton's (Byron's friend Hobhouse's) *Recollections of a Long Life* (4 vols. 1909-10) rather restated than reinforced the defence for Byron. It need only be added that the new charge against Mrs Musters rests upon no direct testimony whatever as yet produced, and that there is still none as to the other one against Mrs Leigh. See book by Sir John Fox (1924). Other books on Byron, besides the above, are the short Life by Professor Nichol (1883); works by Lady Blessington (1834), Medwin (1824), the Countess Guiccioli (1868), and Miss E. C. Mayne (1912); and John Drinkwater, *Pilgrim of Eternity* (1926). Lord Broughton's *Recollections* abound in intimate references to the poet and his affairs. The editions of Byron's works are innumerable, the most authoritative proceeding from the publishing house of Murray. The final edition of his *Works, Letters, and Journals* by Rowland E. Prothero (Lord Erle) and Ernest Hartley Coleridge was published in 13 vols. in 1898-1904. His *Correspondence* was edited by John Murray (1922). For Byron in Germany see Oelsenbein (1905), and for Byron and French Romanticism, Estève (1907). Brandes in *The Mann Currents of Nineteenth Century Literature* (vol. iv. 1905) gives what must be pronounced an extravagant eulogy of Byron. The German translation of 1828 in 31 vols. was by thirteen different authors; an independent one was issued in 1830-31. *Childe Harold* appeared in Armenian, Hungarian, Bohemian, Danish, and Swedish versions; was twice translated into Russian, five times into Polish, eight times into Italian, at least eight times into French, and eleven times into German. Somewhat similar was the case with *Don Juan, Manfred*, and the other important works of the poet. Only two children of Byron are known. Allegra (1817-22), his illegitimate daughter by Claire Clairmont, died before him, to his great grief. His daughter Ada (1815-52) married in 1835 Lord Lovelace, and left two children, Lord Lovelace and Lady Anne Blunt (Baroness Wentworth).

Byron, HENRY JAMES, dramatist, born in Manchester, January 1834, entered the Middle Temple in 1858, and was for many years a prolific and popular writer of burlesques and extravaganzas. He wrote extensively for periodicals, was the first editor of *Fun*, and leased several theatres, where he produced more ambitious plays, in which he himself occasionally appeared. These were less comedies than domestic dramas, enlivened by the smart dialogue and brisk incidents of farce. The best was *Cyril's Success* (1868); the most successful,

Our Boys, which had an unprecedented run in London from 16th January 1875 to 18th April 1879. Byron died in London, 11th April 1884. He excelled in depicting Cockney vulgarity, and his dialogue is clever and amusing, but overladen with repartee and puns, for which he readily sacrificed probability. His plots are original and ingenious, and are always healthy and full of human interest.

Bysshe, EDWARD, lived in London as a literary hack in the beginning of the eighteenth century. His *Art of English Poetry* (1702) is notable as containing, in addition to a rhyming dictionary and a collection of allusions, similes, descriptions, &c. from the English poets, a set of 'dogmatic rules for making verses,' which attained immediate recognition as an authoritative statement of the neoclassic creed. He edited Sir Richard Bulstrode's *Letters* (1712), and translated Xenophon (1712).

Byssus, an old name for silk-like threads secreted by the 'foot' of many bivalve molluscs. The secretion, from a gland opening in a median posterior furrow, is at first fluid, but soon hardens into silky threads. The process may be readily watched in an aquarium. Its occurrence in the common mussel is very familiar. There, as in most other cases, the tufts of spreading threads

Byssus of Common Mussel.

serve to anchor the mollusc temporarily or permanently to its base of attachment. In other cases, however, it may be employed in binding together a rude nest (*Crenella discors*, *Modiola vestita*, *Lima hians*). In young forms also, as in the common fresh-water mussel, a byssus gland may be present weaving silken threads of attachment, but this does not appear to be exactly comparable to the adult organ. The silk of the very large *Pinna nobilis* is finer and more abundant than that of any other mollusc. It has been woven into small articles of dress, in early times for royal personages, in later for lovers of curiosities, especially at Taranto, Reggio, and Cagliari in Italy. See BIVALVES, MOLLUSCA, MUSSEL, PINNA.

Byström, JOHANN NIKOLAS, a Swedish sculptor, was born in 1783, lived much in Italy, and died at Rome, 13th March 1848.

Bytown, till 1854 the name of Ottawa (q.v.).

Bytownite, a Felspar (q.v.) between anorthite and labradorite.

Bywater, INGRAM (1840-1914), a consummate Greek scholar, born in London, studied at University and King's College schools, and Queen's College, Oxford, and was in 1893-1908 regius professor of Greek at Oxford. He edited the *Ethics* and *Poetics* of Aristotle, and other philosophical works. See Life by W. W. Jackson (1917).

Byzantine Architecture is the style practised in Byzantium and the Eastern empire from the time when Constantine made Byzantium, thenceforth Constantinople, his capital, till its capture by the Turks in 1453. It belongs to the Christian art of Hellenic and Oriental peoples from

the time that it began to differ markedly from early Christian art, which originally both east and west had largely in common. This style of architecture, whose traditions are still preserved in the buildings of the Eastern Church, branches out of the classic styles of Greece and Rome. Owing to the long continuance at Byzantium, under its new name of Constantinople, of part at least of the power and sovereignty of the Roman empire, and to the comparative exemption of the eastern capital from the invasions of the barbarians who overran and destroyed the monuments of the West, the transition from the classic forms of construction and design can be more clearly traced in the former than in the latter. When Constantine, in the beginning of the 4th century, removed the seat of the imperial court and government from Rome to Byzantium, he created in his new capital a fine field for the practice of the arts, and especially of architecture. Many new and splendid edifices were required, and every encouragement was given to those familiar with the constructive and decorative arts to come to Byzantium, and lend their aid in making the new city more splendid even than the old capital.

At this time Roman art was in its decadence. The classic forms and ornaments were debased and decrepit, and new features derived from the constructional elements of Roman building were beginning to supersede them. Thus, in the palace of Diocletian at Spalato, the horizontal classic entablature began to be carried round the arches, and the latter to spring directly from the capitals of the columns. In its transference to Constantinople this decaying Roman art came into contact with new elements, which inspired it with fresh life. The Romans were distinguished as constructors, and had elaborated the scientific use of the arch and vault on a great scale in their large edifices. These vaults were of several different kinds, comprising both the dome and the intersecting barrel vault. It is remarkable how the adoption of these forms of vaulting, the first by the Eastern and the last by the Western peoples, led to the development of the two great styles of the middle ages—the Byzantine and the Gothic. It seems certain that the Sassanians in Persia had practised the use of the dome for a considerable time, and it is probable that their vicinity to the meeting-point of East and West at Constantinople may have had an important influence in determining the final adoption and development of the domical form as the leading feature of Byzantine architecture. The same influence no doubt tended greatly to modify the classic details into those characteristic of the Byzantine style. The former being debased and worn out, the new ideas derived from the East were gladly seized upon, and in their turn inspired the artists with fresh vigour. The Greek element in the population also no doubt contributed to produce a strong influence on the taste and refinement displayed in this style.

The churches built by Constantine seem to have been on the same plans as those of Italy—viz. either round or basilican in form. Of these two

forms examples exist (although rebuilt) at Jerusalem and Bethlehem, and in both the ancient classic entablature and details are retained, while the arches spring from the capitals. By the time of Justinian, in the 6th century, the new style had been formed and fully developed in its main features. As above mentioned, the dome constituted the ruling element in the construction. The difficulty with this form was so to enlarge it as to give sufficient space for a great church. At first an aisle was placed round the central part (immediately under the dome), the latter being supported on eight pillars or piers. But these encumbered the floor and impeded the view, and after a time this inconvenience was obviated by the discovery that the dome might be supported on four pillars by corbelling out the angles between the circle and the square. This important invention enabled the design to be extended indefinitely by a number of domes, just as is the case with the groined arches of the West. The grandest example of this design is the church of St Sophia at Constantinople, built under Justinian, in the first half of the 6th century. There the interior is composed of a great central dome, 107 feet in diameter and 182 feet in height, carried on four piers, and length is given to the church by the addition of a semi-dome at either end. These also serve to sustain the pressure of the upper dome. The lower part of the building is

Section of St Sophia, Constantinople.

divided up with small pillars and arches, which have the effect of enhancing the size and grandeur of the simple dome. The latter is pierced with a row of windows round its base. This feature became afterwards a constant one in Byzantine churches. Externally the sloping apertures looked awkward, and a series of upright arches was substituted, with a dome resting above them. This being a weak form of construction, it tended to limit the size of the domes used in later examples. One striking characteristic of the Byzantine style is the extensive use of coloured decoration. This is a notable feature in St Sophia, where the pillars are formed of and the walls are lined with the richest marbles, while the domes are adorned with splendid mosaics.

Byzantine ornament differs considerably from the classic as well as the Gothic of the West, being always flat and incised, while the latter is bold, and apparently applied to or projected from the structural form, as, for instance, in the cusp. A curious reminiscence of the classic entablature is preserved in the block which usually intervenes in Byzantine architecture between the capital of the

columns and the arch. The Byzantines were distinguished during the middle ages for all kinds of carving and metal-work, and there can be no doubt that these works of art had a great influence in the

Byzantine Capital from the nave of St Demetrius, Thessalonica.

12th century on the nascent art of the West. The church of St Mark at Venice is by far the most notable of the Byzantine style in the West. It was copied soon after its erection in the 11th century at Périgueux, in Aquitaine, and this led to the extensive use of the dome in that part of France. The Roman Catholic Cathedral of Westminster, consecrated in 1910, is the most outstanding recent example of Byzantine

architecture in the West. See Sir T. G. Jackson's *Byzantine and Romanesque Architecture* (1913)

Byzantine Art in general, developed at Constantinople under the same influences as Byzantine architecture, was mainly used for the decoration of churches. From the 6th century onwards for several centuries the most interesting remains of pictorial art were mosaics in the churches and miniature illustrations of Bibles and religious books. The Byzantine school, both in mosaic and painting, is characterised by a hierarchical stiffness in representing the human figure, by length and meagreness of limbs, features almost blank in expression, long, narrow eyes, and conventional attitudes. The colours, bright but crude, were often laid on a gold background. Yet even this type is superior in dignity and strength to the earliest Christian style of art, based on a degraded Roman pattern. The Byzantine style changed or developed very little for centuries, so that it is difficult to discover the date of a picture by internal evidence. It prevailed universally in Italy and other parts of Europe till the end of the 13th century, when Giotto (q.v.) broke from the Byzantine model which Cimabue (q.v.) still followed, and thus began the great renaissance of painting. The Byzantine method is still largely practised for religious subjects in Russia, Greece, and other countries belonging to the Greek Church. See ART, MOSAIC, PAINTING, RENAISSANCE.

Byzantine Empire, also styled the EAST ROMAN, EASTERN, GREEK, or LOWER EMPIRE, was founded in 395 A.D., when Theodosius the Great, at his death, divided the Roman empire between his two sons, Arcadius and Honorius. The empire had previously for a time been divided into East and West, but the division then made by Theodosius was final. Arcadius, a weak and luxurious character, was made emperor of the eastern division, formerly included under the prefectures of the East and part of Illyricum—namely, Syria, Asia Minor, and Pontus, stretching along the shores of the Black Sea in Asia; Egypt in Africa; and Thrace, Mœsia (now Bulgaria), Macedonia, Greece, and Crete in Europe. The empire thus formed lasted more than a thousand years, and underwent a great variety of fortune. It took the name of Byzantine empire from Byzantium, the ancient name of its capital, which after 330 was usually called Constantinople or New Rome.

(1) *Period of Greek Revival* (395–716), marked by the victories of Justinian and Heraclius.—Arcadius left the government of the empire in the hands of his minister Rufinus, from whom it passed to the eunuch Eutropius, and afterwards to Gainas, the murderer of Rufinus. Gainas fell by his ambition in 401, and the shameless and avaricious Empress Eudoxia ruled until the time of her death in 404 (see ARCADIVS). Arcadius was succeeded by his son, Theodosius II. (408–450), a feeble prince. During his reign affairs were ably and successfully conducted by his sister, Pulcheria. Yet Thrace and Macedonia could only be secured from the destructive conquests of Attila by the payment of tribute. After the death of Theodosius II., Pulcheria married the senator Marcianus (450–457), whose firmness repelled the invasions of Attila. Marcianus was followed by Leo I., surnamed Macella (the Butcher), a Thracian of low birth, but elevated to the throne by the commander-in-chief, Aspar, who, being himself an Arian, would not venture to encounter the perils that sovereignty might have entailed on one of his religious views. Leo II., grandson of the former, succeeded, but died after a few months, in consequence of which the crown came into the possession of his father, Zeno (474–491), who was banished by Basiliscus (475), but who reascended the throne in 477. Though a weak and unpopular ruler, he contrived to retain his power in spite of several serious revolts. The internal distraction of the empire, to which, as at other times, religious strifes added considerably, increased greatly during the reign of Zeno, and the invasions of the Goths were prevented only by gifts and stratagems. Ariadne, widow of Zeno, married the courtier Silentiarius, and raised him to the throne under the title of Anastasius I. (491–518). By the help of the Goths, this monarch overthrew the robber tribes of Mount Taurus. A new enemy, however, now appeared on the Danube in the Bulgarians, against whose desolating raids Anastasius built the Long Wall, to protect the peninsula on which Constantinople is situated. The war with the Persians also broke out anew during his reign, and religious tumults often purpled the streets of Constantinople itself. After his death, the army raised Justinus I. to the throne. He maintained his position mainly through the favour of the clergy, whom he had conciliated by his severe persecution of heretics.

His nephew, Justinian (q.v.), succeeded (527–565). He was celebrated for his code of laws, and for the victories of his great generals, Belisarius (q.v.) and Narses (q.v.), which re-established the empire both in Africa and Italy. But the rapid decline of the empire after his death showed that he had not been able to give it any internal consolidation or vitality. It was during the reign of Justinian that those pestilent contests of the Blues and Whites against the Greens and Reds (political factions so named from the colours respectively worn) first attained any consequence; and though the first disturbance was terribly chastised by Belisarius in 532, they continued to distract the capital periodically down to the 7th century. Justin II. (565–578), a weak man, governed by his wife, Sophia, yielded a part of Italy to the Longobards, was unsuccessful against the Persians, allowed the Avars to plunder the Danubian provinces, and ultimately became insane through vexation and anxiety. Tiberius, the captain of the guard, was then made regent, and after the death of Justin II., received the imperial dignity. He ruled with mildness and prudence (578–582), purchased a peace with the Avars, concluded the war with Persia, and left as his successor the commander-in-chief, Maurice, who reigned from 582 to 602. Having replaced on the throne the Persian

king, Chosroes II., who had been banished by his subjects, he thus secured the peace of his eastern frontiers; but the war against the Avars did not prosper. His niggardly treatment of the army caused a military insurrection, in which he was slain along with his son; and Phocas, one of his generals, was elevated to the throne. Phocas proved a bad ruler. Through his monstrous vices, tyranny, and incapacity for government, the empire lapsed into still deeper anarchy. Suddenly, however, a deliverer appeared in the person of Heraclius (q.v.), son of the exarch or governor-general of Africa, who overthrew the tyrant, and ascended the throne in 610. But great as was the genius of Heraclius, he had to submit to twelve years of defeat before he could organise and discipline a victorious army. In 622 he opened those magnificent campaigns in which the power of Persia was crushed, and which, in the opinion of Gibbon, were equal to those of Scipio or Hannibal. He lived, however, to see more formidable foes in the Saracens, who, during 632-641, overran the countries on the Euphrates, with Syria, Judæa, and Egypt. The power of the Greeks, which was demanded to resist the Arabian invasions, was miserably divided and weakened by their unending religious quarrels, especially the controversy of the Orthodox against Monothelism. The empire was breaking asunder, and Heraclius, worn out with the fatigues of war, had abandoned his enfeebled senses to pleasure, and his enfeebled intellect to theological discussions. He died in 641. Constantine III., who succeeded his father, Heraclius, also died soon after, and was followed for a short time by Heraclonas. The next ruler was Constans, son of Constantine III., who ruled from 642 to 668, made himself odious by cruelty, and perished in an insurrection. His son, Constantine IV., Pogonatus (668-685), repelled a seven years' siege (672-679) of the Saracens, chiefly by means of the Greek fire. On the other hand, he was compelled to pay tribute to the Bulgarians, who had established themselves in ancient Mœsia. Justinian II. (685-711), son and successor of Pogonatus, had a most troubled reign. At this period the empire had sunk to a very low condition, having lost most of its possessions both in Asia and Europe, while anarchy and rebellion prevailed at home. Six emperors were dethroned in twenty-one years. It was saved from ruin by the talent and energy of Leo III., the Isaurian, general of the army of the East, who in 716 seized the throne.

(2) *Period of Comparative Prosperity (716-1057)*, marked by successful defence against Saracens and Bulgarians.—Leo reorganised the army and the financial system, and in 718 repelled a formidable attack of the Saracens, but in 726 unfortunately began the controversy about image-worship, which rent the empire for more than a century. In 728 the exarchate of Ravenna was lost, and the eastern provinces became the prey of the Saracens, over whom, however, he won a great victory in Phrygia. He died in 741. Constantine V. (741-775), son of Leo III., was on account of his zeal as an iconoclast hated by the monks, who gave him the surname 'Copronymos,' because, as they said, he had polluted the font at his baptism. He was a brave ruler, recovered from the Saracens parts of Syria and Armenia, and ultimately defeated the Bulgarians, against whom he had long been unsuccessful. His son, Leo IV. (775-780), was a mild ruler; but by the ability of his generals, he made the boundaries of the empire secure against the Saracens. After him, Constantine VI. ascended the throne under the guardianship of his ambitious mother, Irene (q.v.), who raised a powerful party in favour of image-worship. Constantine having

made an attempt to liberate himself from the influence of his mother and her paramour, Stauratius, Irene barbarously caused her own son to be blinded (797). He died soon after this atrocity; and Irene, who had boldly conceived the design of marrying the Emperor Charlemagne, and thus uniting the east and west of Europe in one vast realm, excited the opposition which in 802 placed her treasurer, Nicephorus, on the throne. The restoration of the western empire by Charlemagne in 800 completed the division of the old Roman empire into East and West. Nicephorus, who fell in battle against the Bulgarians (811), was succeeded by his son, Stauratius, who soon yielded the throne to his brother-in-law, Michael I., from whom it was taken by the Armenian general, Leo V., a powerful ruler, who conquered the Bulgarians, but fell (820) in a conspiracy excited by his zeal against image-worship. Michael II., the Stammerer, was raised from a dungeon to the throne, and ruled until 829. In his reign, Crete and Sicily passed into the hands of the Saracens. Under the rule of his son, Theophilus, who is praised by the Byzantine historians for his love of justice (829-842), the general, Manuel, gained some indecisive victories over the Saracens. Theodora, widow of Theophilus, and guardian of Michael III. (842-867), brought the controversy about image-worship to a close at the council of Nicæa, or Nice, in 842, when it was fully sanctioned and restored. During this reign the government busied itself in the persecution of the Paulicians (q.v.), while the Saracens devastated the Asiatic provinces.

Theodora having been banished to a convent by her son, the government was for some time held by Bardas, uncle of Michael III., and after his assassination, by Basilus I., the Macedonian, who caused Michael to be put to death, and afterwards ruled ably from 867 to 886. But though on the whole he was successful against the Saracens, the latter contrived to make themselves masters of Syracuse. His dynasty (the Macedonian) maintained itself on the Byzantine throne, with some few interruptions, until 1056. The reign of his son, Leo VI., the Philosopher (886-912), was not prosperous. The inroads of the Bulgarians and of the Saracens, who in 904 plundered Thessalonica, continued to increase during the government of his son, Constantine VII., Porphyrogenitus, who ruled mildly but feebly (912-959). Under his son, the dissolute Romanus II. (959-963), Crete was retaken from the Saracens by the vigour of his general, Nicephorus Phocas, who, on the death of the emperor, married his widow, Theophania. She, however, caused him to be murdered in 969, as she wished to marry John Zimisces, who ruled till 976, and, like his predecessor, was victorious against the Saracens and Bulgarians, as also the Russians, who for a considerable period annoyed the empire with their attacks. His successor, Basilus II. (976-1025), the son of Romanus, conquered the Bulgarian kingdom, and attached it as a province to the empire, which it remained till 1186, when it again became independent. His brother, Constantine VIII. (1025-28), did not resemble him. Romanus III. next ascended the throne, but was assassinated by his wife, Zoe, a profligate but crafty princess, who raised successively to the imperial dignity Michael IV. (1034), Michael V. (1041), and Constantine IX. (1042). After Constantine's death in 1054, Theodora, sister of Zoe, was elected empress; and on her death in 1056, Michael VI., who was deposed by Isaac I., Comnenus. At the beginning of the 11th century the Saracen power, which had so long been a dangerous rival of the Byzantine empire, broke down, but the Seljuk Turks, a yet more formidable enemy, appeared on the eastern frontier.

In Lower Italy, the Normans narrowed the Byzantine power to the possession of Otranto.

(3) *Period of Decline* (1057-1204), marked by the Crusades and the advance of the Turkish power in Asia.—With Isaac I., Comnenus, who came to the throne in 1057, the dynasty of the Comnenian emperors began. He retired to a monastery (1059), and was succeeded by Constantine X., whose widow, Eudocia, married Romanus IV., and raised him to the throne. Romanus was deposed in 1071 by Michael VII. (son of Constantine X.), who, in his turn, was dethroned by Nicephorus III. (1078), who reigned until 1081, when he was deposed by Alexius I. (q.v.), Comnenus (1081-1118). This last reign was marked by the commencement of the Crusades, during which the Byzantine emperors had a most difficult part to play. The Crusades, however, helped greatly to check the advance of the Seljuk Turks, whose dominion had already extended itself to the Hellespont. The successors of Alexius—his son, Kalo-Joannes (1118-43), and Manuel I. (1143-80)—were able rulers, and victorious in their engagements with the Turks. Manuel's son, Alexius II., was murdered by his guardian, Andronicus (grandson of Alexius I.), who raised himself to the throne. He was the last prince of the Comnenian dynasty, and fell in an insurrection excited by his own cruelty (1185). A period of confusion ensued, during which an Isaac II., and three emperors of the name of Alexius, followed each other in quick succession till 1204.

(4) *Latin Occupation* (1204-61).—In 1204 the French and the Venetians (collectively named *Latins*) advanced on Constantinople, and captured the city. The European portion of the empire was divided into four parts, of which the first, including the metropolis, fell to the lot of Baldwin, Count of Flanders, who was made emperor, and to whom the other participants in the expedition did fealty for their respective shares. In the west of Asia Minor, Theodorus Lascaris, who had been elected emperor at Constantinople, formally transferred the seat of government to Nicæa; in the north-east of Asia Minor, the governor of the province of Colchis, Alexius Comnenus, ultimately ruled at Trebizond with absolute authority; while one of his successors, John Comnenus, even assumed the title of emperor. The Latin occupation was an event alike disgraceful to the leaders who effected it and permanently hurtful to the Byzantine empire, which never recovered its lost cohesion. At Constantinople neither Baldwin nor his successors could strengthen the sinking empire. Baldwin himself died a prisoner in the hands of the Bulgarians. After him came his brother Henry, who ruled bravely and wisely till 1216. For the next four years the empire was actually without a ruler, and a prey to utter anarchy. In 1221 Robert, son of Peter, Count of Auxerre and Courtenay, came to the throne; he was succeeded by John of Brienne, titular king of Jerusalem (1228-37), and the latter by Baldwin II. (1237-61). During these reigns a great part of the empire was seized by John Vatazes, successor of Theodorus Lascaris of Nicæa (1222-55). This ruler was followed in Nicæa by Theodorus II. (1255-59), whose son, Johannes, during his minority, was superseded by Michael VIII., Palæologus, who, by the help of the Genoese, captured Constantinople in 1261, and thus put an end to the Latin dynasty.

(5) *Period of Fall* (1261-1453), marked from 1354 by the rapid advance of the Turks in Europe. Michael, the first of the Palæologi, a powerful prince, really endeavoured to strengthen the realm; but by his unhappy attempt to unite the Greek Church with the Latin, from which it had decisively separated (1054), he gave great offence

to the clergy and the people. His son, Andronicus II., who came to the throne in 1282, re-established the Greek ritual. After the death of his son and co-regent, Michael IX. (1320), Andronicus II. was compelled to divide the throne with his grandson, Andronicus III., who became sole emperor in 1328. This monarch unsuccessfully opposed the Turks, who took Nicæa and Nicomedia in 1339, and wasted the European coasts. He died in 1341. Under his son, Johannes V., the Turks first made a permanent settlement in Europe by the taking of Gallipoli in 1354. In 1361 the sultan Amurath took Adrianople, and made it the seat of government. In 1381 all that remained of the Byzantine empire became tributary to the Turks. Manuel II., son and successor of Johannes, was besieged in Constantinople by Bajazet, who defeated an army under Sigismund of Hungary at Nicopolis in 1396, and compelled the Byzantine monarch to cede to the Turks one of the main streets of the city. The fall of the city seemed inevitable, when it was saved by the advance into Asia Minor of the great Tartar conqueror, Timur, who defeated Bajazet at Angora in 1402. By this diversion Manuel recovered some portion of the Byzantine provinces; but made so little use of the occasion, that in 1422 the metropolis was again besieged by Amurath II., who, after he had overthrown the force sent to aid the emperor by Ladislaus, king of Hungary, at the battle of Varna, made Constantinople in 1444 the limit of the domains of Johannes VII., son of Manuel. Constantine XI., brother of Johannes, bravely but fruitlessly contended against the overwhelming Turkish forces, and fell heroically in the defence of Constantinople, which was captured by Mohammed II., May 29, 1453, when the Byzantine empire was brought to a close. The petty Latin princes who existed here and there in Greece, and the despots, Demetrius and Thomas, who ruled in the Morea, were subdued by Mohammed in 1460; while David, a member of the Comnenian dynasty, the last emperor of Trebizond, submitted in 1461.

It was for long usual for authors dealing with the bloody record of dynastic crimes in the Byzantine empire to affirm that the history of the world never witnessed so degraded a caricature of imperial government. Against all such summary statements Freeman and others energetically protest, declaring that careful study brings the fairer side into relief, and that, on the whole, the history of the fall of the Byzantine empire is the record of a noble struggle in the face of overwhelming odds. For many centuries the empire was a bulwark of Christian culture against Persians, Saracens, and Turks; and it transmitted Christianity to Russian and other Slavonic tribes after long protecting it from them.

The constitution of the Byzantine empire was founded on the institutions of Diocletian and Constantine the Great, and was purely despotic. The emperors, who were consecrated by the Patriarchs of Constantinople, claimed, as the true descendants of the Cæsars, a sovereignty over the West as well as the East, and styled themselves 'rulers of the Romans,' even after Charlemagne had founded a new dynasty. Though great influence was at various times exercised by the clergy as well as by women, courtiers, and ministers, the emperors were pure autocrats, having supreme power in all departments of government, and being themselves superior to all law. By pompous titles, by great splendour of costume, and by a strict observance of an elaborately minute court ceremonial, as well as by the cruel penalties inflicted for any insult offered to the imperial dignity, or to the dignity of the emperor's relatives, they kept themselves sacredly apart from the people. Gradually every-

thing disappeared that might have been a check upon the utter despotism of the supreme power. As early as the 6th century, the consulate was absorbed into the mass of imperial honours, while the traces of the senate which Constantine had established at Byzantium, and which was composed of those on whom the emperor had bestowed the dignity of the patriciate, as well as the chartered privileges of the towns, had entirely vanished in the 10th century. The privy-council, to whom the conduct of the state was intrusted, was arbitrarily chosen by the emperor. The state officials were very numerous, and their respective ranks carefully distinguished. They were raised far above the people by titles and privileges, but were utterly dependent on the throne. Among these the *Domestici* (including many eunuchs) claimed the highest rank as immediate attendants on the emperor. The *Domestici* were made commanders-in-chief of the army. Among them the *Domesticus* of the East (styled, *par excellence*, *Megadomesticus*) held the highest rank, and finally, under the Palæologi, was considered the first civil and military officer of the realm. The provinces were ruled by governors bound to contribute certain sums to the royal revenue, which gave rise to oppressive exactions. No distinction was made between the state-revenue and the privy-purse. For military service, the land was divided into districts (*Themata*); and the army, down to the later times, consisted almost entirely of foreign mercenary troops. The imperial body-guard, or *Spatharii*, were mainly soldiers of Teutonic race, the most noted being the Varangians from Scandinavia. The admiral of the fleet was styled *Megas Duux*. In the midst of constant internal and external disturbances, the administration of justice was grossly neglected and abused, though Justinian and other emperors earnestly endeavoured to establish just laws. See the articles on the principal emperors; the historical sections of the articles *ROME* and *TURKEY*; Gibbon's *Decline and Fall of the Roman Empire* (edited by Bury, 1896-1901); Finlay's *History of Greece*, long the authority for the Byzantine empire (7 vols. 1851-56; new ed. 1877); Gasquet, *L'Empire Byzantin* (1888);

Harrison, *Byzantine History* (1900); Pears, *The Destruction of the Greek Empire* (1904); Schlumberger's *L'Épopée Byzantine* (4 vols. 1900-5); the *Cambridge Medieval History* (vols. ii., iv. 1913-23); Diehl, *Byzance, Grandeur et Décadence* (1919) and *Histoire de l'Empire Byzantin* (1920, trans. 1925); Baynes, *The Byzantine Empire* (1926)

Byzantine Historians have all the literary faults of a period when freedom, originality, and force of intellect and character were repressed by a pedantic despotism. Yet, as they are the only sources of information regarding the vast empire of the East, they are invaluable. The most interesting and instructive among them are those who confine their attention to a limited number of years, and to the events which came under their own observation, or in which they took part. The principal Byzantine historians were collected and published at Paris in 36 vols., with Latin translations, under the editorship of P. Philippe Labbé, a Jesuit, and his successors (1654-1711). This magnificent collection was reprinted, with additions, at Venice (1727-33). In 1828 Niebuhr, assisted by Bekker, the Dindorfs, and others, began a *Corpus Scriptorum Historie Byzantine*, carried on till 1855 in 48 vols., and continued by the Berlin Academy of Sciences. A series was begun under the general editorship of Professor J. B. Bury in 1898.

Byzantines. See *BEZANTS*.

Byzantium, a city on the Thracian Bosphorus, founded by emigrants from Megara in 667 B.C. rapidly became a seat of commerce. Subject to the Persians (515-478 B.C.) it was freed by Pausanias, and was alternately Athenian and Lacedæmonian during the Peloponnesian war. Thrasybulus expelled the Spartans in 390, and the city long enjoyed a kind of independence. It was taken by Severus in 196 A.D., and in 330, under the name of New Rome or Constantinople, it was made the metropolis of the Roman empire. See *CONSTANTINOPLE*.

the third letter of our alphabet, represents historically the third letter of the ancient Semitic alphabet, pronounced as *g* in *go*. The name of this letter is in Hebrew *gimel*, in Syriac *gōmal*; an older form *gamla* is implied by the Greek *gamma*. These forms are alter-

tations of the Semitic word for camel (Assyrian *gammalu*, Hebrew *gāmāl*, Syriac *gamlō*, Arabic *jaml*). The earliest known shape of the letter, \wedge (whence, by gradual alteration, the Hebrew \beth), has been plausibly conjectured to represent a camel's head and neck. In Hebrew and Aramaic the letter retained its primitive sound (modified, however, after vowels); in Arabic it is *dah* (= English J), though some dialects have kept the original pronunciation.

The Greeks adopted the Semitic letter with its original value, but also used it for the sound of *ny* before guttural consonants. In Greek inscriptions it had many varieties of shape, but the form Γ (whence the modern Γ) ultimately became universal. One local type was \angle , of which the rounded form **C**, which passed into the Roman alphabet, is probably a modification.

The Romans adopted the letter with its original sound, but (from some cause, the nature of which is disputed) they also used it instead of K, which was practically disused, though it retained its place in the alphabet. In the 3d century B.C. the modified form **G** (see G) was introduced for the sound *g*, and thenceforward **C** was used exclusively for the *k* sound, except in the abbreviations **C** for Gaius, **Cn.** for Gnaeus.

In late Latin **C** retained the sound *k* except before palatal vowels (*e, æ, œ, i, y*), in which position this sound gradually developed, in Italy into *tsh*, and elsewhere into *ts*. In the Romanic and Germanic languages **C** is sounded *k* before *a, o, u*, and consonants, and when final; before palatal vowels its sound has the following varieties: *tsh* (Italian, in some dialects *sh*); *ts* (German, early French); *th* (Castilian Spanish); *s* (Portuguese, Spanish dialects, French, English, Dutch, Danish, Swedish). (For the character **Ç**, see CEDILLA.) In modern German, Dutch, Danish, and Swedish **C** occurs only in words of foreign origin, except in *sh* (for which see below) and in *ck*, used in German and Swedish for *kk*. Recent German orthography avoids **C** even in Latin derivatives, writing, e.g., *Konzept* for *Concept*. English has adopted the two French sounds of **C**, and has developed a third value, *sh*, by change of pronunciation (in *gracious*, &c.).

In Irish, which adopted the Roman alphabet very early, **C** is always pronounced *k*; so also in Gaelic and Welsh. Irish uses the dotted *c* for the spirant (= German *ch*), into which the *k* sound is modified under certain conditions.

In Old English, **C** expressed both *k* and the palatal sound into which this was sometimes modified. In the 11th century the latter had become *tsh*, so that **C** had two widely different values, as in *cygn*, kin; *cild*, child.

In Bohemian, Polish, and Hungarian, **C** is *ts* in all positions; *tsh* is expressed in Bohemian by *č*, in Polish by *cz*, in Hungarian by *cs*. (*Cz* in Hungarian is an older notation for *ts*, now written *C*.)

The digraph **CH** is practically a separate letter. The Romans used it for the sound *k+h*; in late Latin this became *k*, which remained unchanged before *e* and *i*; hence in Italian it represents the *k* sound before those vowels.

In early High German **Ch** stood for *k+h*; in later German, Dutch, Polish, Bohemian, Welsh, and Gaelic, it represents the guttural (in German also the palatal) unvoiced spirant; so also in the 8th-century spelling of Old English names, as *Coinwalch*, later written *Cenuealh*.

In Spanish and Old French **Ch** = *tsh*; in modern French and Portuguese *sh*. In modern English its sounds are: *tsh*, after old French example; *sh*, in words from modern French; *k*, chiefly in words of Greek origin. In Scottish, from the 14th century, it has been used for the guttural unvoiced spirant (as in German).

In the medieval and modern forms of the letter the resemblance to the Roman **C** remains recognizable, the most divergent form being the German script capital **ſ**. In the Hiberno-Saxon handwriting the capital had the form **L**.

The Roman name *cē* (formed on the analogy of *bē, B*) has been retained in all the European languages written in Roman characters (of course with the pronunciation required by the orthoepic rules of these languages).

C, in Music, is the sound from which the mathematical proportions of intervals are taken. See MUSIC, SCALE, KEY.

Caaba. See KAABA.

Caating Whale (*Globicephalus melas*), one of the Cetacea, in the dolphin family, belonging to a genus common in all seas, and oftener stranded than any other 'whale.' The skull is broad and

Caating Whale.

depressed; snout and brain-case are about equal in length; the front of the nose-like head is rounded by a cushion of fat in front of the blow-hole; there are about a dozen small conical teeth above and below; the fore-limbs are very long (5 feet) and

narrow, and situated far below; the dorsal fin is low and triangular; the tail is deeply forked. The smooth skin of the common species is of a uniform black colour, except a white streak along the ventral surface. The total length varies from 16 to 24 feet, the maximum girth about 10 feet. The caaing whale is very gregarious, and vast shoals of 50 to 100 sometimes impetuously follow their leader ashore, when alarmed and surrounded in a bay or fiord. Exciting scenes of this sort have been frequently witnessed on the Faroe Islands and elsewhere. It is recorded that 1110 were killed in the winter of 1809-10 at Hvalford in Iceland. In temper the animals are mild compared with some of their allies. They feed chiefly on cuttle-fishes. Many names are given to these common cetaceans—e.g. Pilot-whale, Black-fish, Social Whale, Grind-hval, &c. The name Caaing or Ca'ing Whale is derived from the Scots word *ca'* for *call* in the sense of 'drive.' Several species are distinguished in different seas, but the characteristics are trivial, and somewhat vague.

Cabal', a term now employed to denote a small, intriguing, factious party, united for political or personal ends. It had been previously used to denote a secret committee or cabinet, when, during 1667-73, it was specially applied to Charles II.'s infamous ministry, consisting of five members, whose initials, by a strange coincidence, made up the word CABAL—viz. Clifford, Ashley (Shaftesbury), Buckingham, Arlington, and Lauderdale. The word goes back through French *cabale* to the Hebrew *kabbalah*, 'something received.' See CABBALA.

Caballero, FERNAN, the pen-name of one of the most popular of more recent Spanish writers. She was the daughter of Nikolas Bohl von Faber (1770-1836), a German merchant in Spain, who had married a Spanish wife, and himself made some real contributions to the history of Spanish literature. Born at Morges in Switzerland in 1797, while her parents were travelling, she spent great part of her childhood in Germany, but returned to Spain in 1813, and in her seventeenth year married a merchant named Planell, whom she accompanied to America. A few years later she found herself a widow, and soon after married the Marqués de Arco Hermoso, two years after whose death in 1835 she married an advocate named Arrom, to become a third time a widow in 1863. The sad circumstances of her third husband's death and her profound dissatisfaction with the liberal political movements of the time clouded her later years with gloom. She died at Seville, April 7, 1877. Fernan Caballero was a prolific writer, but none of her fifty *cuentos* are long. The first was *La Gaviota*, which appeared in 1849 in the pages of the journal *El Heraldo*. Others that may be mentioned are *Elia*, *Clemencia*, *La Familia de Alvarada*. Her *Cuentos y Poemas populares Andaluces* (1859) is important as an early collection of Spanish folk-tales and songs. She herself arranged a collection of her works in 13 vols. (Madrid, 1860-61), but to this must be added the later *Coleccion de Articulos religiosos y morales* (Cadiz, 1862); *La Mitologia contada á los Niños* (Barc. 1873); *Cuentos, Adivinos, Oraciones y Refranes populares é infantiles* (Madrid, 1877); and *Cuadros de Costumbres* (Valencia, 1878). Fernan Caballero possessed the rare gift of story-telling, and had besides a marvellously deep and sure insight into the simple heart of the peasant of Andalusia. Her old-world and somewhat sentimental catholicism sounded strange to the young Spain even of her own day, but added to the charm her stories had for those who held it unwise to destroy before it could be seen what the

world was to gain in exchange for the faith, hope, and charity of the old religion.

Cabanis, PIERRE JEAN GEORGES, a French physician and philosophical writer, born at Cosnac, Charente-Inférieure, in 1757. He commenced life as secretary to a Polish magnate at Warsaw, but soon returned to Paris to study medicine. At the outbreak of the Revolution he attached himself to the popular side; he furnished Mirabeau with material for his speeches on public education; and Mirabeau died in his arms. During the Terror he lived in retirement, and was afterwards a teacher in the medical school at Paris, a member of the Council of Five Hundred, then of the senate. He died near Meulan, May 5, 1808. His chief work is his once-famous *Rapports du Physique et du Moral de l'Homme* (1802). The book is clever, and its absolute sensationalism was so far before its time that its author might well have been suspected to be but burlesquing with grave irony the doctrines of his brother-materialists. The soul is not an entity, but merely a faculty; the brain an organ specially fitted to produce thought, as stomach and intestines accomplish digestion.

Cabatuan, a town of the Philippine Islands, in Panay island, in a district growing rice, maize, and tobacco; pop. 20,000.

Cabbage (*Brassica oleracea*; see BRASSICA), a cruciferous plant cultivated for culinary purposes, and for feeding cattle. The common cabbage is said to have been introduced into England by the Romans, but to have been little known in Scotland until brought by Cromwell's soldiers. The principal varieties are known to have existed at least as far back as the 16th century, but minor varieties are being constantly produced by selection and intercrossing. The varieties (see BRASSICA) differ greatly from each other, and the ancestral wild cabbages yet admit of simple interpretation as terms of a continuous series of simple variations. The parent is of highly vegetative character, as its habitat and habit alike show; and placed in more favourable conditions its growth becomes luxuriant. This vegetative exuberance may be expressed in the simplest way by a growth of the parenchyma of the leaf, which is thus thrown into wavy folds, which are specially developed in the common kale; or the vegetative surplus may be reserved for flowering in various ways. Manufactured in the leaf, this surplus cannot pass away save in the first place through the leaf-stalk; and in one variety, the Portugal or Tronchxuda Cabbage, it remains in the midribs, which consequently become parenchymatous and succulent. More normally, however, it is carried back into the stem, and this may accordingly become swollen and turnip-like, in which case we have the Kohl-Rabi, of which an extreme subterranean and almost turnip-like variety has also arisen, or may be, as in the Jersey Cabbage, largely applied to the purpose of the growth of the stem, which may reach a height of 8 to 10 feet, and furnish not only walking-sticks but even spars for small thatched roofs, &c. The vegetative overplus may however also be applied to the formation of buds, which accordingly develop with peculiar exuberance, giving us Brussels Sprouts, or may be withheld from the lateral buds to be lavished upon the apical one alone, which thus forms the enormous 'head' of the cabbage. From excessive nutrition the flowering of this terminal bud is delayed until its own large and solid non-vegetative bulk, as well as the checking of the vegetation of the external green leaves by the winter, have given the reproductive functions an opportunity of preponderance. The most evolved and final variety is the Cauliflower, in which the vegetative surplus becomes poured into the flowering head, of which

the flowering is more or less checked; the inflorescence becoming a dense corymb instead of an open panicle, and the majority of the flowers aborting, so as to become incapable of producing seed. Let a specially vegetative cabbage repeat the excessive development of its leaf parenchyma, and we have the wrinkled and blistered Savoy, of which the hardy constitution, but comparative coarseness, become also more intelligible; again a specially vegetative cauliflower gives us an easily grown and hardy winter variety, Broccoli, from which, and not from the ordinary cauliflower, a sprouting variety arises in turn.

The whole series of variations from wild cabbage to cauliflower, from leaf to buds in the sprout, lateral to terminal bud in the cabbage, and flower in the cauliflower, are thus seen to be hypertrophied arrestments of a single process, that subordination of vegetative gains to reproductive life which is the normal fact of individual history in the organic world, as well as the essential factor of floral evolution. See BOTANY.

Cultivation.—The cabbage is biennial, consequently the main crop must be sown the autumn previous to that in which it is to be reaped. Field cabbages and the *drumhead* varieties that are used in gardens, being late in character, may be sown in July, or from the third week of that month to the second week of August. But the smaller and early sorts used in gardens should not be sown before the first week of August, nor later than the second week of that month. If the plants are reared earlier, they are apt to run to seed the following spring; and if, on the other hand, they are reared later, they will not acquire strength enough to withstand the cold of winter before it comes upon them. For successive crops to be used in the shape of young summer cabbages, one or two sowings may be made from the beginning of March to the beginning of April. Autumn-sown plants may be planted out in rows permanently as soon as they are strong enough. Additional plantations from the same sowing may be made in spring, to be followed by others, made at intervals up till July, from spring-sown plants. Thus a close succession of usable cabbage may be obtained the year round. In the northern parts of the United States, cabbages for the early summer market are sown about September, kept under glass or frames during winter, and planted out in spring. For later markets, the seed is sown in beds as early as possible in spring (about March), and transplanted later. Cabbages are sometimes preserved for winter by inverting them and burying them in the ground.

Cabbage-coleworts may be obtained from any good early variety of cabbage. They are simply cabbages which are not permitted to form hearts, but are used while the leaves are yet green and the hearts more or less open. Three sowings should be made for the rearing of these, the first about the middle of June, the second about the same time in July, and the third about the last week of the latter month, or the first week of August. These sowings will provide crops of green cabbages from October till March or April, if the winter is not destructive, after which they begin to run to seed.

Cabbage Bark. See ANDIRA.

Cabbage Butterfly, a name common to several species of butterfly, the larvæ of which ('cabbage worms') devour the leaves of cruciferous plants, especially of the cabbage tribe. The Large Cabbage Butterfly, or Large White (*Pieris* or *Pontia brassicae*), is one of the commonest British butterflies. It is white, with wings tipped and spotted with black. The female is more decorative than the male. The wings, when expanded,

measure from $2\frac{1}{2}$ to 3 inches across. The female lays her conical, bright yellow eggs in clusters of twenty or thirty, on the leaves of the plants which are the destined food of the caterpillars. The spring brood are found usually on wild cruciferae; the summer set on garden vegetables. The caterpillars, when fully grown, are about 1 inch or $1\frac{1}{2}$ inch long, and are excessively voracious, eating twice their own weight of cabbage-leaf in twenty-four hours. When full grown, they suspend themselves by their tails, often under ledges of garden-walls, or similar projections, and are metamorphosed into shining pale-green chrysalids, spotted with black, from which the perfect insect emerges, either in the same season, or, in the autumn brood, after the lapse of a winter—no longer to devour cabbage-leaves, but to subsist delicately upon nectar.—The Small Cabbage Butterfly, or Small White, sometimes called the Turnip Butterfly (*Pieris rapae*), very much resembles the former, but the expanse of the wings is only about 2 inches. The eggs are laid singly on the under side of the leaves of cabbages, turnips, &c., and the caterpillars, which are of a velvety appearance, pale green, with a yellow line along the back, and a yellow dotted line on each side, sometimes appear in great numbers, and prove very destructive. They bore into the hearts of cabbages, instead of merely stripping the leaves, like those of the last species, and thus are a greater pest, even when comparatively few. The chrysalis is of a pale yellowish-brown colour, freckled with black.—A third species, also common in Britain, the Green-veined White Butterfly (*Pieris napi*), very nearly resembles the small cabbage butterfly.—The excessive multiplication of these insects is generally prevented by small birds, which devour them and their caterpillars, also by wasps, and by insects of the Ichneumon (q.v.) tribe, which lay their eggs in the caterpillars, that their own larvæ may feed on them. As regards artificial prevention and remedies, the eggs of the large white being laid in clusters can be removed from the cabbage-leaves; the chrysalids should be sought and destroyed; various washings, dressings, and the like are useful, such as sprinklings of salt, watering with lime-water or soap-suds, and dressing the surrounding soil with soot or gas-lime; a good drenching of any kind is often advantageous. The cabbage butterfly has become naturalised in the United States, where it is very destructive. See Miss Ormerod's *Injurious Insects*.

Cabbage-fly (*Anthomyia brassicae*), a dipterous insect in the same family as the house-fly, flesh-fly, &c., and belonging to a very large genus with about 480 European species, many of which are in their larval state very injurious to vegetables. The adult insect is about a quarter of an inch in length, and has a general ashy-gray colour, somewhat different in the two sexes. The maggots are found in summer on the roots and lower stems of cabbages and similar plants. The pupæ are rusty red in colour, and the last generation lie in the ground throughout winter. The entire development occupies about eight weeks, and there are several successive generations between June and October. The best prevention is probably rotation of crops; the earth round the roots of the cabbages should be drawn away to destroy the pupæ; watering with lime-water will kill the maggots.

Cabbage-moth (*Mamestra brassicae*), a species of moth, the caterpillar of which feeds on cabbage and turnip leaves, and is sometimes very destructive. The caterpillar is greenish-black, and changes to a chestnut chrysalis in autumn. The perfect insect is predominantly of a rich mottled-brown colour, with beautiful markings. The winter

chrysalids should be destroyed when turned up in digging; the voracious grubs should be picked away from the cabbages, and the stems may be very profitably protected by making a ring in the ground with spirit of tar, quicklime, or gas-lime.

Cabbage-palm, Cabbage-tree, names given to various species of Palm, whose great terminal bud is eaten cooked like cabbage, or sometimes raw in salads. The Cabbage-palm of Brazil and the West Indies is *Oreodoxa oleracea*. The palmetto, coconut palm (*Cocos nucifera*), and others are sometimes similarly employed, in all cases at the total sacrifice of the tree. The Australian Cabbage-palm is a *Livistona* (*L. mirmis* or *australis*); the 'cabbage' is small, but the leaves, dried and drawn into strips, are plaited to make the 'cabbage-tree hat' which figures conspicuously in accounts of Australian exploration and pastoral life.

Cabbala (also written *Cabala*, *Caballa*, *Qabalah*) means 'that which is received,' i.e. 'tradition,' and is from the Hebrew *kabbalah*, which might be used for any Jewish doctrine not explicitly contained in the Hebrew Bible since the present form of the Biblical text; the moral and ritual precepts of the Talmud are all ascribed to a tradition which can be traced back step by step. But in its technical sense, the Cabbala signifies a secret system of theology, metaphysics, and magic prevalent among the Jews. The Cabbalists taught a pantheistic doctrine, which came to them from the later and degenerate philosophies of Greece—viz. those of the Neoplatonists and Neopythagoreans. But, being Jews, they shared the common Jewish belief that their Scriptures are the fountainhead of all knowledge, and accordingly they read their doctrines into the Bible in all kinds of artificial ways, especially by the mystic significance which they attached to numbers, and the advantage they took of the fact that each Hebrew letter also stands for a numeral. They held that their so-called science was both speculative and practical, because the knowledge of metaphysical laws was supposed to clothe the adept with supernatural power. Thus like the school of the Essenes, like the Alexandrian philosophy, like Christianity itself, the Cabbala sprang from weariness of the dead letter, from a reaction against the petrified Judaism of the Rabbis. It substituted an immanent God, a God who is in nature and one with it, for the strict monotheism of the orthodox Jews.

In the Talmudic treatise 'Chagiga' there is frequent mention of secret knowledge, and in particular of a cosmogony called the 'Work of Genesis,' and a theosophy called, in allusion to the opening chapter of Ezekiel, the 'Work of the Chariot.' We are told that this knowledge is at once very sacred and very perilous, but no details are given. The authoritative documents of cabbalistic doctrine are the 'Sepher Yetzirah,' or 'Book of Creation,' ascribed to Rabbi Akiba, who died 120 A.D., and the 'Sepher Hazzohar,' the 'Book of Brightness' (see Dan. xii. 3), ascribed to Simeon-ben-Jochai, a contemporary of Akiba's. The real dates are very difficult to fix. A book with the title Yetzirah is mentioned by the Gemara in the 5th or 6th century, and by Saadia in the 10th. Possibly the book intended may be substantially identical with that which now bears the name. Zohar, which refers to the Talmud, the Arab empire, &c., cannot be older than the 8th century, and is ascribed by some eminent critics to the 13th. 'Yetzirah' is written in the Neo-aramaic of the Mishna, Zohar in the Neo-aramaic of the Gemara.

The kernel of the cabbalistic teaching is that all emanates from God, and at every turn we are reminded of the fanciful pantheism of the Gnostics.

There is no creation in the common acceptance of the term, and on the other hand no eternal matter. All that we see is due to the self-development of the Deity. In himself he is the absolute without any attribute, since all attributes limit the being of whom they are predicated. God as the absolute being is also called Adam Kadmon, 'the first or ideal man' (see Ezek. i. 26; Dan. vii. 13). Next he becomes determined by ten attributes, 'wisdom and understanding,' 'mercy and judgment,' &c. These are conceived as male and female, and they are formed into three triplets or Trinities. They constitute 'the world of emanation,' and they are the 'channels' through which the world of pure spirits, the world of angels and heavenly bodies, and the lowest world, that in which we live, have come into being. Man's body represents in its different parts the realities of the upper worlds: his soul has pre-existed, realises its own nature on its descent to this earth, and after transmigration from body to body, returns to God. The sacred character of certain numbers—e.g. of three, of seven, of ten—regulates the mode in which these ideas, half mythological, half philosophical, wholly pantheistic, are arranged; and an interpretation of the Bible based likewise on the significance of numbers, and entirely removed from all rational exegesis, adjusted the Cabbala to the letter of the written word.

The chief cabbalistic writers flourished between the 13th and 16th centuries. Of these R. Moses ben Nachman (1195-1270), better known as Ramban, is the most eminent. More and more, the philosophic were obscured by the magical elements, and orthodox Rabbis justly objected that the worship of ten divine attributes as real beings was an abandonment of Jewish monotheism. Further, cabbalistic sects attached themselves to pretended Messiahs, such as Sabbatai Zevi, born at Smyrna in 1640. The followers of Jakob Frank in Germany (1713-98), and the sect of Chasidim—i.e. 'Pious'—in Poland, were also connected with the Zoharites or Cabbalists. On the other hand, the resemblance between certain features in the emanation doctrine and the Christian Trinity induced some Jews to turn Christian, and made Christians favourable to the Cabbala. Pico della Mirandola (*Conclusiones Cabbalisticæ*, 1486) and the truly great Reuchlin (*De arte Cabbalistica*, 1517) were both eager Cabbalists. See TALMUD.

Cabeiri, mystic divinities chiefly worshipped at Samothrace, Lemnos, and Imbros, but also at Thebes, Pergamos, and elsewhere, were regarded by most early writers as children of Hephæstus, but little is known of their character or the nature of their worship. They are identified by some with Demeter, Persephone, and Rhea; by others with the Dioscuri (Castor and Pollux); by others, again, with the Roman Penates.

Cabell, JAMES BRANCH, novelist, poet, genealogist, journalist, born in 1879 at Richmond, Virginia, has written, besides many short stories and essays, *Jurgen* (1919), *Figures of Earth* (1921), and other romances remarkable for their style and their heroes. *From the Hidden Way* (1916) is a volume of bogus adaptations from old-time troubadours.

Caber, TOSsing THE, a Scottish athletic exercise or feat, in which a large beam or young tree, heavier at one end than the other, is held perpendicularly balanced against the chest, small end downward, and tossed so as to fall on the heavy end and turn over, the farthest toss and straightest fall winning. Competitions where the powers of the opponents are unknown are generally started with a caber of 24 or 25 feet, from which the thick end is sawn off by degrees, until the proper length is got at. The thin end, held in the hand, should be not more than 3 inches in

diameter; the average length of a good larch caber is about 21 feet.

Cabés, or *Gabes*, a port of Tunis, in a fertile district at the head of the gulf of the same name (ancient *Syrta Minor*). It was in the 5th century a bishop's seat, and in the 10th a rich and strongly fortified town. The harbour admits small vessels only. Pop. about 10,000.

Cabet, ÉTIENNE, a notable French communist, was born at Dijon in 1788, and educated for the bar, but turned his attention to literature and politics. Under the Restoration, he was one of the leaders of the Carbonari (q.v.), and in 1831 was elected deputy for the department of Côte d'Or. Soon afterwards, he published a *History of the July Revolution* (1832), started a Radical Sunday paper, *Le Populaire* (1833), and on account of an article in this paper, was sentenced to two years' imprisonment, but escaped to London. After the amnesty, 1839, he returned to Paris, and published a *History of the French Revolution* (4 vols. 1840), bestowing great praise on the old Jacobins. He attracted far more notice by his *Voyage en Icarie* (1840), a 'philosophical and social romance', describing a communistic Utopia. The work obtained great popularity among the working-classes of Paris. Cabet next proceeded to send an 'Icarian colony' to the Red River in Texas, but the colonists who went out in 1848 found Texas anything but a Utopia. Their ill fortune did not deter Cabet from embarking at the head of a second band of colonists. On his arrival he learned that the Mormons had just been expelled from Nauvoo in Illinois, and that their city was left deserted. The Icarians established themselves there in 1850. Cabet's efforts, however, were not successful. He was finally obliged to leave Nauvoo and retire to St Louis, where he died in 1856. See *Shaw's Icaria* (1884), and books by Prudhommeaux (1900-7).

Cabinda, a small Portuguese territory on the west coast of Africa, delimited in 1886, bounded on the E. by Belgian Congo, which on the S. separates it from the mouth of the Congo. The capital, Cabinda, was formerly a noted slave port; pop. 8000, now chiefly engaged in boat-building and coast trading.

Cabinet, in Great Britain, is the body of ministers who carry on the government. It is an institution which has gradually grown out of the needs and exigencies of our political life, and is now an essential part of our polity. 'Yet,' says Macaulay, 'it still continues to be altogether unknown to the law; the names of the noblemen and gentlemen who compose it are never officially announced to the public; no record is kept of its meetings and resolutions, nor has its existence ever been recognised by any Act of Parliament.' In former times the Privy-council were the advisers of the crown, but as the Privy-council was a large body, a small informal council of royal advisers grew up within it. This became marked under the Stuarts, especially Charles II. The rise of the cabinet as we know it, however, really dates from the revolution of 1688 and the effectual establishment of parliamentary government. The members of cabinet are the leaders of the majority of the House of Commons, and the position of the cabinet as the executive government marks the supremacy of the representatives of the people. It was a considerable time after the revolution of 1688 before this state of things received its full development. As William III. was a foreigner raised to the throne by a revolution and dependent on parliament, it was during his reign about 1693 that the cabinet in its modern form originated. But for some generations the cabinet was a loosely arranged body of ministers without a fully acknowledged

chief, without full powers, and without a fully developed collective policy. The aim and tendency of the personal rule of George III. was to degrade the cabinet into ministers dependent on himself. Even so late as 1834, William IV. took it upon him to dismiss a cabinet which was objectionable to himself personally. At present, in the event of a change of government, the royal initiative is confined to the duty of 'sending for' the leader of one of the great parliamentary parties. The particular leader may not always be definitely indicated, in which case the sovereign exercises a certain discretion. With regard to the cabinet generally, it may be said that while composed of members of both Houses of Parliament, it must depend on the majority of the House of Commons; it must be united on the leading questions of the day, and must follow a common policy; and it acknowledges a collective responsibility to parliament for its principal acts. The sense of collective responsibility was relaxed in Mr Lloyd George's cabinet. As the executive organ of parliament it is very elastic, and, while subject to considerations of use and wont, its action can be suited to the exigencies of time and circumstance. As a rule it includes the First Lord of the Treasury, the Lord Chancellor, the Lord President of the Council, the Lord Privy Seal, the secretaries of state, the Chancellor of the Exchequer, and the First Lord of the Admiralty. With other members it usually numbers about eighteen, but a large cabinet is not an advantage. In 1916-19 there was a small inner 'war cabinet' of five to seven members, including latterly General Smuts, a South African minister. These, with representatives of the dominions, formed an 'imperial war cabinet.'

In the United States the cabinet consists of the Secretary of State, the Secretaries of the Treasury, of War, of the Navy, of the Interior, of Agriculture, of Commerce, and of Labour, the Attorney-general, and the Postmaster-general. These are the heads of their respective departments, and in their collective capacity act as Advisory Board to the president. They are appointed to office by the president, but their appointments must be confirmed by the senate, and they generally hold office until their successors are appointed and confirmed. Contrary to the English system, the United States cabinet-ministers must not have seats in congress; there is no premier, and the president, not the ministers, is responsible for the acts of the government. The salary of members of cabinet is \$12,000 a year.

The word cabinet, it may be added, is frequently used for analogous institutions in other countries.

Cable, GEORGE WASHINGTON, a popular American author, was born in New Orleans, October 12, 1844. He had early to shift for himself, and at nineteen volunteered into the Confederate service. He saw some hard service, and in one action was severely wounded. After the war he earned for some time a precarious living, and finally found himself laid up with malarial fever caught at survey work on the Atchafalaya River. During his two years' illness he began to write for the New Orleans papers, and his success ere long was such as to encourage him to devote himself to the literary craft. His sketches of Creole life published in *Scribner's Monthly* made his reputation, revealing as they did to the world an interesting phase of American social life hitherto unknown. His keen observation and dexterous literary use of the Creole dialect at once found him a public on both sides of the Atlantic. Among his books are *Old Creole Days* (1879), *The Grandissimes* (1880), *Madame Delphine* (1881), *Creoles of Louisiana* (1884), *The Silent South* (1885), *Bonaventure* (1888), *John March* (1895), *Strong Hearts* (1899), *The Cavalier* (1901), and *Bylow Hill* (1902). By writing and lecturing he secured important reforms

in contract convict labour in the southern states. He died 31st January 1925 at St Petersburg, Florida.

Cable is either a large rope or a chain of iron links, chiefly employed on shipboard to suspend and retain the anchors. Rope cables are made of the best hemp or of wire, twisted into a mass of great compactness and strength. The circumference of hemp-rope varies from about 3 inches to 26. A certain number of yarns are laid up left-handed to form a *strand*; three strands laid up right-handed make a *hawser*; and three hawsers laid up left-handed make a *cable*. The strength of a hemp cable of 18 inches circumference is about 60 tons; and for other dimensions, the strength is taken to vary according to the cube of the diameter. Wire-rope has within comparatively recent times been to a certain extent taking the place of hemp for tow-line and hawsers on board ship. These usually consist of six strands, laid or spun around a hempen *core*, each strand consisting of six wires laid the contrary way around a smaller hempen core. The wires are galvanised or zinc'd, or else coated with a preservative composition. Wire-ropes are usually housed on board ship by winding them round a special reel or drum. Hemp cables, moreover, have for long been almost wholly superseded by chain cables; the introduction of steam on board ship having brought in its train the powerful steam-windlass wherewith to manipulate the heaviest chains and anchors required. Hempen and wire ropes are of course invariably used as tow-lines and for mooring vessels.

Chain cables are made in links, the length of each being, generally, about 6 diameters of the iron of which it is made, and the breadth about $3\frac{1}{2}$ diameters. There are two distinct kinds of chain cables—the stud-link chain, which has a tie or stud welded from side to side, and the short-link or unstudded chain. (As to mode of making chain cables, see under CHAINS.) The cables for use in the mercantile service are made in 15 fathom lengths, but in government contracts chain cables are required to be made in $12\frac{1}{2}$ fathom lengths, with one swivel in the middle of every alternate length, and one joining-shackle in each length. Besides the ordinary links and joining-shackles, there are end-links, splicing-tails, mooring-swivels, and bending-swivels. The sizes of chain cables are denoted by the thickness of the rod-iron selected for the links. The following table gives certain ascertained quantities concerning the cables in ordinary use:

Thickness of Iron.	Weight of Stay-pin.	Weight per Fathom.	Breaking Strain
$\frac{1}{2}$ in.	$3\frac{1}{2}$ oz.	$13\frac{1}{2}$ lb.	6 tons.
1 "	3 $\frac{1}{2}$ "	54 "	24 "
$1\frac{1}{2}$ "	12 "	121 "	60 "
2 "	28 "	215 "	99 "
$2\frac{1}{2}$ "	40 "	272 "	126 "

Compared with the strength of hempen cable 1 in. diameter chain cable is equivalent to $10\frac{1}{2}$ in. circumference hemp, $1\frac{1}{2}$ in. to $13\frac{1}{2}$ in., $1\frac{1}{2}$ in. to 16 in., $1\frac{1}{2}$ in. to 18 in., and 2 in. to 24 in.

By the Chain Cables Act of 1871, certain bodies are licensed to erect machines for testing all chain cables and anchors; and it is forbidden to sell or purchase any chain cable or any anchor weighing more than 168 lb. which has not been duly tested.

Stag's Head
caboched.

Minor alterations were introduced in 1874; and the Anchors and Chain Cables Act (1899) simplified and amended the law. For submarine cables, see TELEGRAPH; and for cable tramways, TRAMWAY.

Caboched, or **CABOSSED**, an heraldic term, from the old French word *caboche*, 'the head.' When the head of an animal is borne, without any part of the

neck, and exhibited full in face (or *affronté*), it is said to be caboched.

Cabot, or **CABOTTO**, GIOVANNI, discoverer of the North American mainland, was a Genoese, naturalised in 1476 in Venice, who settled about 1490 as a merchant in Bristol, where he is supposed to have died about 1498. Under letters-patent from Henry VII., dated 5th March 1496, he set sail from Bristol in 1497, with two ships, accompanied by Lewes, Sebastyan, and Sancto, his sons, and on 24th June sighted Cape Breton Island and Nova Scotia. He seems also to have coasted along Newfoundland. Letters-patent were granted, 3d February 1498, for a second expedition; but whether any voyages were made under these is doubtful. —The same uncertainty exists as to the birthplace of his second son, SEBASTIAN, who, it now appears most probable, was born at Venice in 1474. Sebastian's name is associated with that of his father in the charter of 1496, and in 1499 he appears to have sailed with two ships in search of a North-west Passage, and followed the American coast from 60° to 30° N. lat.; but it has been considered doubtful whether this voyage also should not be assigned to his father. We hear no more of Sebastian till 1512, when he appears to have attained some fame in England as a cartographer, in which capacity he entered the service of Ferdinand V. of Spain in the same year. A contemplated voyage of discovery to the North-west was frustrated by the death of the king in 1516; and the jealousy of the regent, Cardinal Ximenes, impelled Cabot to return to England in 1517. During this visit he appears to have been offered by Henry VIII., through Wolsey, the command of an expedition which, through either the cowardice or malice of Sir Thomas Perte, who was appointed his lieutenant, 'tooke none effect;' but whether the expedition ever left England or not has been disputed. In 1519 Cabot returned to Spain, and was appointed pilot-major of the kingdom by Charles V., for whom, in 1526, he commanded an expedition which examined the coast of Brazil and La Plata, where he endeavoured to plant colonies. The attempt ending in failure, he was imprisoned for a year in 1530, and banished for two years to Oran, in Africa. In 1533 he obtained his former post in Spain; but in 1547 he once more betook himself to England, where he was well received by Edward VI., who made him inspector of the navy, and gave him a pension. To this monarch he seems to have explained the variation of the magnetic needle in several places, which he was among the first, if not the very first, to notice particularly. In 1553 he was the prime mover and director of the expedition of Merchant Adventurers which opened to England an important commerce with Russia. He seems to have died in London in 1557. Of his famous map (1544), embodying the discoveries of his father and himself, one example exists, preserved in the Bibliothèque Nationale at Paris.

Among monographs on the Cabots are those by Nicholl (1869), Harriase (Paris, 1882; Eng. trans 1896), Dawson (1895), Weare (1897), and C. R. Beazley (1898); see also the histories of America by Winsor (1885), Avery (1905), and Bushnell Hart and others (1900-5).

Cabourg, a village in the French department of Calvados, near the mouth of the Dives, 11 miles SW. of Trouville by rail, much visited for sea-bathing. It has fine sands, a raised terrace-promenade, a casino, and all the equipments of a fashionable watering-place. It has been proposed to establish a fortified port here.

Cabra, a town of Spain, 37 miles SE. of Cordova, on a stream of the same name (a tributary of the Jénil), has an old castle, a college, and an active wine trade; pop. 13,000.

Cabral, or CARRERA, PEDRO ALVAREZ, the discoverer—after Pinzon—of Brazil, was born about 1467 of a good old Portuguese family. After Vasco da Gama's first voyage, the king appointed Cabral to the command of a fleet of 13 vessels, carrying 1200 men, and bound for the East Indies. On the 9th March 1500 he sailed from Lisbon. To avoid becalming off the coast of Africa, he took a course too far westerly, fell into the South American current of the Atlantic, and was carried to the unknown coast of Brazil, of which, on 25th April, he claimed possession for the king of Portugal, naming the new country 'Terra da Santa Cruz.' After sending home one vessel to bear news of his accidental discovery, Cabral sailed for India; but on 29th May four of his vessels foundered, and all on board perished, including Diaz the great navigator; and soon afterwards three more vessels were lost. Cabral therefore landed at Mozambique, on the east coast of Africa, of which he first gave clear information, and sailed thence to Calicut, where, having made the terror of his arms felt, he was permitted to found a factory, entered into successful negotiations with native rulers, and thus established the first commercial treaty between Portugal and India. He returned with a considerable booty, and dropped anchor at Lisbon, 31st July 1501. He probably died about 1520. See *Life* by J. R. McClymont (1914).

Cabrera, one of the Balearic Isles (q.v.), uncultivated, but producing wild olives. Area, 8 sq. m. There is a good harbour, with a fort. The island is used by the Spanish government as a penal settlement, and was crowded with French prisoners during the war in the Peninsula.

Cabrera, DON RAMON, Carlist leader, was born at Tortosa, Catalonia, in 1810. Intended for the church, he had already received the minor orders, when the death of Ferdinand in 1833 gave the signal for civil war. Cabrera at once joined the *absolutists*, or partisans of Don Carlos, and by his energy, daring, and pitiless cruelty—at least after the shooting of his aged mother by Mina (1836) for treasonable correspondence—soon made his name a household word throughout Aragon and Valencia. Defeated and severely wounded at Rancon, he escaped with difficulty into the woods, but soon reappeared at the head of a really formidable force, overthrew the royal army at Buñol and at Burjasot, and though vanquished at Torre-Blanca, he soon after reopened the war with fiery energy, and even for a time threatened Madrid itself. In 1839 Don Carlos created him Count of Morella and governor-general of Aragon, Valencia, and Murcia; but Marotto's treachery obliged him to act solely on the defensive, and in July 1840 he was driven across the French frontier. In 1845 he strongly opposed Don Carlos's abdication of his rights, and in 1848 renewed the struggle for absolutism in Spain; but the adventure proved a miserable failure, and early in 1849 he had to recross the Pyrenees. He afterwards married a wealthy English lady. When Alfonso was proclaimed king of Spain in 1875, Cabrera published a manifesto advising the Carlists to submit to him, as a good son of the church. He died at Wentworth, near Staines, 24th May 1877.

Cabs derive their name from the *cabriolets* de place introduced into England from Paris at the beginning of the 19th century. As early as 1672, we are informed, on the authority of Count Gozzadini, that *cabriolets*, or gigs with hoods, 'an affair with a curved seat fixed in two long bending shafts, placed in front on the back of a horse, and behind on two wheels,' were introduced from Paris into Florence, where they so rapidly increased that in a few years they numbered over one thousand.

These vehicles appear to be the original of the *carriole* of Norway, the *calesso* of Naples, and the *volante*, a hooded gig on two very high wheels, of Cuba. In Paris the *cabriolet* de place was introduced about the middle of the 17th century by Nicholas Sauvage, whose residence in the Rue St Martin at l'Hôtel St Fiacre has given the name of *fiacres* to the public carriages of that city. In 1805 Messrs Bradshaw and Rotch obtained licenses for eight *cabriolets* which were started in London; and a newspaper of April 23, 1823, states that 'cabriolets were in honour of his majesty's birthday introduced to the public this morning. They are built to hold two persons inside, besides the driver (who is partitioned off from his company), and are furnished with a book of fares . . . which are one-third less than the hackney coaches.' These two-wheeled cabs, built by Mr Davies, had a body somewhat similar to the 'hansom,' but smaller, the forepart of the head being capable of being folded. Their number was, owing to the opposition of vested interests, at first limited to twelve. They were painted a yellow colour, and stood for hire in a yard in Portland Street, Oxford Street. They speedily acquired great popularity, and in 1832, when all restrictions as to numbers were removed, had reached a total of sixty-five. Ultimately they displaced the hackney coaches (public vehicles are still officially designated 'hackney carriages'). First used in England about 1605, these were chiefly the discarded carriages of the nobility utilised and licensed for public use. In 1625 their number was restricted to fifty, thirty-seven years later they had increased to 400, when the government began to impose a tax of £5 upon each vehicle, and in 1715 their total reached 800. By reducing their size, and building the under-carriage shorter than those of the nobility, great improvement was effected (1790). The *cabriolet* de place, which, as we have seen, gradually displaced the hackney coach, was itself succeeded by a cab patented by Mr Boulnois. It was drawn by one horse, and carried two passengers facing each other, the driver being seated on the top, the vehicle having a door behind. This falling out of fashion, a larger cab, of the brougham type, but smaller and plainer, for two persons, came into use in 1836. On this design the Clarence four-wheeler was founded.

The introduction of the hansom patent safety cab, named after the inventor, the architect of Birmingham town-hall, marked a new era in rapid street locomotion. The patent was taken out in 1834. The hansom originally consisted of a square body, the two wheels, about 7½ feet in diameter, being the same height as the vehicle. Numerous improvements were made upon this, and in 1836, a fresh patent being taken out by Messrs Gillett and Chapman, a company was formed for establishing hansom cabs. From that time there was a steady advance made in the construction and appointments of the hansom. Those introduced by Lord Shrewsbury claim special notice for their convenience and smart appearance. Among later improvements is the use of a folding framework hood, permitting the vehicle to be used either open or closed. Cabs with india-rubber tires followed, and steadily advanced in favour. A three-wheeled cab, a new invention, was licensed in 1887.

The taximeter, which on the Continent had been for some time in general and in some towns almost in universal use, both on horse-cabs and on motor-cabs, for the automatic regulation of fares, has in Great Britain been associated with the coming of the motor-cab. This vehicle was introduced in London in 1897, but was not at first successful. Since then, however, its success has been such as to cause a crisis in the cab trade and no little

distress among drivers of the horse-cab, now largely superseded.

Cabs in Great Britain are subject to police and municipal regulation. In London the principal acts are the Metropolitan Streets Act, 1867; the Metropolitan Public Carriages Act, 1869; the London Cab Act, 1896; and the London Cab and Stage Carriage Act, 1907. The act of 1867 consolidated and amended previous acts relating to cab and vehicular traffic in London; that of 1869 made special regulations for the granting of licences, the inspection of cabs, and the qualifications of drivers. Outside London cabs are usually regulated by private acts incorporating the Town Police Causes Act, 1847, an act with provisions similar to those of the London acts.

Cabmen's shelters, founded 1875, to afford drivers accommodation and shelter when on the stands, have proved of great service to the men, and have greatly promoted habits of sobriety. The Cab-drivers' Benevolent Association was founded in 1870 to grant annuities and give legal and pecuniary assistance to cab drivers and their widows; and a Home of Rest for Horses in 1887 to provide rest for overworked cab horses.

Cabul. See KABUL.

Cacao. See COCOA.

Caccamo, a town in the province of Palermo, Sicily, 5 miles SW. of Termini, with mines of agate, jasper, and beryl; pop. 12,000.

Caccini, GIULIO, musician, was born in Rome about the middle of the 16th century. After studying under Scipione della Palla he betook himself to the Florentine coast, where during the rest of his life he took a leading part in the movements then affecting the history of music. In particular, his experiments, with those of Peri, in the resuscitation of the ancient Greek drama with musical accompaniment, resulted in the invention of opera. He composed in this kind *Il Combattimento d'Apolone col Serpente* (1590), *Dafne* (1594), and with Peri the highly successful *Euridice* (1600). The last-named was produced at the marriage of Henry IV. of France and Maria de' Medici. He also published a book of songs, *Nuove Musche*, with remarks on the art of singing. He died about 1618.

Cáceres, the second largest province of Spain, in the north of Estremadura, owned chiefly by large proprietors, and mostly devoted to cattle-raising; the northern half is a good wine country. The area is nearly 8000 sq. m., and the population over 400,000.—The capital, Cáceres, 45 miles N. of Merida by rail, is famous for its bacon and sausages, and has a bull-ring of granite, dye-works, and manufactures of woollens, crockery, and rope. It was the *Castra Cæcilia* of the Romans, by whom it was founded in 74 B.C.; and here the allied forces defeated the rear-guard of the Duke of Berwick, 7th April 1706. Pop. 24,000.

Cachalot is a name for the Sperm Whale. See WHALE.

Cachao. See HANOL.

Cachar, a district of British India in the province of Assam, bordering on Manipur; area, 3769 sq. m.; pop. 500,000. The staple crop is rice. Next in area, but much more valuable, is tea. The tea-plant was discovered growing wild here in 1855, since which time the tea-growing industry has become highly important, about a fourth of all the tea exported from Assam coming from this district. Its forests are considered practically inexhaustible, and timber is exported to Bengal. The town of Silchar is the administrative headquarters.

Cache (Fr., 'hiding-place'), in Canada and the western states of America, and now generally, a hole dug in the ground for concealing provisions and other articles cumbersome to carry.

Cachet, LETTRES DE. See LETTRES DE CACHET.

Cachexia (Gr. *kakos*, 'bad'; *hexis*, 'habit'), a term used in medicine of an obviously unhealthy condition of the body. It is chiefly used in regard to chronic diseases, where the general nutrition is defective, and the blood in an unhealthy state. Thus, Cancerous Cachexia indicates the peculiar impoverished state of the blood and general debility which are associated with the deposits of cancer in various parts of the body; Gouty Cachexia, the state of the general system in gout, as opposed to the mere local attack of gout in the foot. Lead Cachexia is used of the condition of general enfeeblement which sometimes results from the slow absorption of lead into the system; Mercurial Cachexia similarly in chronic poisoning by mercury. Cachexia Strumipriva is the name applied to the peculiar condition found to result from removal of the thyroid gland.

Cacholong, a beautiful mineral, regarded as a variety of semi-opal; see OPAL. It is sometimes called Pearl Opal, or Mother-of-pearl Opal. It is generally milk-white, rarely yellowish or reddish.

Cachucha, less correctly Cachuca, in music, is a Spanish dance-form in 3-4 time, similar to the bolero.

Cacique, or CAZIQUE, the designation given to the chiefs of Indian tribes in works relating to Central and South America. The word was formed by the Spaniards from a native Haytian word.

Cacodyl, or KAKODYLE, is an organic substance containing carbon, hydrogen, and arsenic (CH₃)₂As, with an unbearable smell. Cacodylic acid has been used with profit in consumptive cases. The oxide of cacodyl ((CH₃)₂As)₂O, otherwise known as Cadet's fuming liquor or alkarsin, has the remarkable property of taking fire spontaneously when exposed to the air, and evolving abundant and exceedingly poisonous fumes of arsenic.

Cacongo, or KAKONGO, formerly a district of Guinea, Africa, extending along the South Atlantic Ocean, in 5° S. lat., just north of the mouth of the Congo. The Cacongo River enters the sea in 5° 12' S. This territory was claimed by the Portuguese, and Cabinda (q.v.) is the north part of it; the south and east to the Congo have been absorbed in Belgian Congo.

Cactaceæ, an order of archichlamydeous dicotyledons, consisting of succulent shrubs of very singular appearance. Linnæus included all the Cactaceæ in the single genus *Cactus*, which is now divided into a number of genera, with about 1000 species; the name *Cactus*, however, still continuing in popular use, common to the whole order. The cactuses are almost without exception natives of America, and their extraordinary forms give a remarkable character to the vegetation of its warmer regions. One is found in Ceylon, and one is a probable native of West Africa. Most of them are leafless, but Peireskia, the tree-cactus of the West Indies and Central America, has in some of its species large oblong elliptical deciduous leaves, somewhat succulent, but essentially similar to those of ordinary plants. But in adaptation to the excessive poverty and dryness of the soils in which they flourish, and especially to the protracted droughts and torrential rains which characterise the dry and the rainy season, the leaves are frequently reduced to spines, or mere abortive scales, with their axillant buds developed merely as a wart bearing a tuft of spines, or even reduced altogether. The vegetative functions are thus thrown entirely upon the stem, of which the rind-parenchyma or cellular envelope (see BARK) becomes of great succulence, often forming the greater thickness of the stem, although a small central woody bundle can, of course, always be

distinguished. The stem may become flattened, as in the Prickly Pear (*Opuntia*), or more frequently be thrown into ridges and furrows, so as to increase the vegetative surface. Protected by its dense and continuous epidermis, the bulky stem of the cactus is thus enabled to store a vast supply of water in the spongy bark and pith, and thus withstand the drought and sun of the most rocky and desert situations, of which they often cover large tracts. On this account they are often of great value as sources of water-supply to man and animals; and travellers upon the Mexican plateau have described how the herds of half-wild horses break down branches of *Cereus* with their hoofs, or kick open the spheroidal *Melocactus*, to quench their thirst. Hence such forms have been called 'springs in the desert.' Some are copiously branched (*Phyllocactus*), and sometimes spreading or trailing. Usually, however, the branches are rarer and inserted with peculiar stiffness (*Opuntia*). In yet more specialised forms the checking of the vegetative buds reduces branching still further, or even stops it altogether, as in the tall upright pillar-like and generally unbranched *Cereus giganteus*, which gives such a strangely monotonous, almost architectural rather than vegetative character to the deserts of New Mexico. Finally, even upward growth ceases, and we have merely the short, thick, spheroidal stems, like those of *Echinocactus*, *Melocactus*, *Mammillaria*, &c., which of course furnish the ultimate term

far up mountain slopes, some Mexican forms almost reaching the snow-line. The peculiar vegetative character, which constitutes the most striking peculiarity of the order, leads to the employment of species of *Cereus* and *Opuntia*, &c., in the formation of hedges of great strength and impenetrability, especially in Mexico and the West Indies. Hence the *Opuntia* has been introduced into the Mediterranean countries, where, in conjunction with the Agave and the native Fan Palm (*Chamerops*), it frequently gives a curiously American character to the landscape. The stems of similar species are used for posts and spars, as also for fuel, especially in districts of Peru and Chile, where timber is scarce; and the wood of old *Opuntia* stems has been used by cabinetmakers.

The cultivation of the cactus family has long been increasingly popular, not so much on account of the frequent beauty or rarity of their flowers as the bizarre and often grotesque vegetative forms, of which the effect is heightened by the spines, which often densely clothe the whole plant, especially in the spheroidal forms, where they may also be replaced or supplemented by a thick growth of woolly or silky hairs.

Some species are easily grown, but their extensive cultivation requires a separate cactus-house, in which the natural conditions of extreme drought during great portion of the year can be imitated. Most of them are easily propagated by branches, which are usually allowed to dry a little before being planted. Those like *Melocactus*, which does not readily produce branches, can be made to do so by cutting or burning out the solitary apical bud.

The flowers are often of great size and beauty, and are remarkable for their floral envelopes, of which the constituent leaves run in spirals instead of whorls, and are thus insensibly gradated from small green foliage leaves with axilliant spiny buds into large and splendid petals. The stamens are also indefinite, the style single, and the stigma three-lobed. The flowers are usually very short-lived; in some night-flowering species, such as the well-known *Cereus grandiflorus*, common in hot-houses, the flower only opens after dark, and perishes before morning.

The fruit is sometimes termed a berry, but not with justice; since the presence of leaves and spine-tufts over its whole outer surface clearly shows we have to do, as in the rose, with a succulent axis, into which the ovary is depressed. The fruit of many species, especially of *Opuntia*, is edible and wholesome (see **PRICKLY PEAR**), and the same genus is further of importance as the food-plant of the cochineal insect. See **COCHINEAL**.

Cactus, a son of Vulcan, was a huge giant who lived in a cave on Mount Aventine. Having stolen and dragged into his cave some of the cattle which Hercules had carried away from Geryon in Spain, he was killed by that hero, who discovered his place of hiding by the lowing of the oxen within, in response to the lowing of the remainder of the flock as they were passing the entrance of the cave.

Cadamba, or **KUDUMBA**, the wood of several species of *Uncaria*, an Indian genus of *Cinchonaceae*. *U. (Nauclea) Gambir* is the source of gambir. See **CATECHU**.

Cadastral Maps are maps on a large and complete scale. Properly a cadastral survey is made by the government for fiscal purposes; the word being derived through the French from Ital. *catastro*, which is from the low Lat. *capitastrum*, 'a register for a poll-tax' (Lat. *caput*, 'the head'). See **ORDNANCE SURVEY**.

Cacti :

a, *Cereus giganteus*; b, *Opuntia coccinellifera*; c, *Mammillaria pectinata*; d, *Phyllocactus anguliger*.

of the series. This reduction of the vegetative system, as might be expected, is usually accompanied by a reduction of size. Some grow rapidly on old lavas, and disintegrate them by their penetrating roots, so preparing a soil for other plants; the prickly pear is often planted in Sicily by the mere insertion of a joint of it in a fissure of the lava. Many species are Epiphytes (q.v.) in American forests (e.g. *Rhipsalis*); others range

Caddis-fly (*Phryganea*, &c.), a name common to the members of a very distinct family of Neuropterous insects. The family (Phryganeidae) is co-extensive with a special division of the order known as Trichoptera, and regarded by some as a foreshadowing of Lepidoptera. The adult insects are somewhat moth-like, and the larvæ often not unlike caterpillars. The two pairs of wings are different; both bear hairs or scales, but the posterior pair are usually broader and can be folded. The mouth organs are not adapted for mastication, the mandibles are degenerate and membranous, and the first pair of maxillæ are fused to the second. Besides these more distinctive features, the caddis-flies have the following general characters: the head is small, the antennæ long and bristle-like, the compound eyes hemispherical, the eye-spots three in number, the wings with very few transverse veins or none, the feet with attaching processes. The adults are very active, especially in the evening and at night.

The eggs are laid in gelatinous masses on plants or stones near or in the water. Into this the larvæ speedily pass, and surround themselves with a sheath usually composed of minute fragments of wood, grass, moss, leaves, stone, shell, and the like, bound together by the silken secretion of a spinning gland which opens on the second pair of maxillæ. Within these tubes the larvæ are both masked and protected. Sometimes they are fixed, sometimes carried about. The tubes which are open at both ends vary greatly, but seem to be constant for the species. Two British species (Setodes) have a primitive type of tube, which is silken and nothing more. Sometimes a few strips of grass stem are simply glued on, but in most cases the sheath is complex, definite, and composed of a multitude of little fragments. In *Helicopsyche* the sheath is spirally twisted like a minute snail-shell. The larvæ feed principally on aquatic plants, and are in turn much eaten by fishes and other animals. The abdomen of the larva discharges aquatic respiration, and bears external respiratory filaments. These are absent in *Enocycla pusilla*, which lives out of the water amongst moss at the roots of trees. After a while the larva

water into aerial life. Some of the smaller species rise to the surface in their cases, and take wing thence, as from little boats.

The caddis-flies form the largest family of Neuroptera; some 800 species are known; of some 500 European forms, about 200 occur in Britain. Besides the typical genus *Phryganea*, with the very common species *Phryganea striata*, *Limnophilus*, *Biachycentrus*, *Setodes*, &c. are represented by British species. The larvæ, very common in ponds and streams in spring, are known as caddis-worms to anglers.

Cade, JACK, leader of the insurrection of 1450, seems to have been sadly slandered by Shakespeare. 'The Captain of Kent' was also known to his contemporaries as Mortimer, was possibly connected with that noble house, and, though apparently born in Ireland, was certainly a man of position and property in Kent. Holinshed says he was a 'young man of a goodly stature and right pregnant of wit.' Buckingham and Archbishop Stafford found him 'sober in talk, wise in reasoning, arrogant in heart, stiff in opinions.' The commons of Kent, with great part of the gentry and mayors of cities, rose against the intolerable misgovernment of the Duke of Suffolk and the gross mismanagement of the French war; and the demands formulated by Cade—so far from approaching the communistic tendency of Wat Tyler seventy years before—were almost entirely for political and judicial reforms, suggested by grievances that Stubbs fully recognised. He showed singular generalship in managing an undisciplined army of some 40,000 men, and after a sharp engagement was master of London for three days; two or three of Suffolk's unpopular ministers had been put to death ere Cade was in command. The feeble king, Henry VI., had withdrawn to Kenilworth, and the citizens at first welcomed the movement. But by exacting money from some wealthy merchants the leader of the revolt turned the citizens against him; admission to the city was now denied him, and his followers were repeatedly repulsed by the Londoners. Official promises not meant to be kept helped to weaken Cade's following, and his dispirited army melted away. He made a futile attempt on Queenborough, and then fled to the Sussex weald, where, in a garden near Heathfield, a Kentish squire fought him and killed him (13th July 1450). His body was cut up and his head and quarters sent to adorn spikes on various city walls. See Clayton's *True Story of Jack Cade* (1910).

Cadell, ROBERT (1788-1849), partner in the publishing-house of Constable and Co., Edinburgh, began business again after Constable's failure, and realised a handsome fortune by his various editions of Scott's works.

Cadelle (*Trogosita mauritanica*), a coleopterous insect sometimes found in granaries in Britain, but seemingly imported from more southerly countries, where, as in France, its larvæ often commit great ravages among stored corn and meal. They also live on bread, almonds, and even rotten wood. When full grown, they are about three-quarters of an inch long, flattened, fleshy, rough with scattered hairs, whitish, tapering towards the head; which is black, horny, and furnished with two curved jaws. The perfect insect is a glossy beetle of a deep chestnut colour, marked with dotted lines. The adults are found in rotten wood, under bark, and in stores of edible materials. The family to which *Trogosita* belongs (Nitidulidæ) is a very large one, and the members (800 species) are widely distributed.

Cademosto, ALOYS DA, explorer, born in Venice about 1432, traded along the Mediter-

Caddis-fly:

a, Perfect insect (*Phryganea striata*); b, larva and case; c, larva of *Limnophilus subpunctulatus* removed from case; d, case of same.

moors its tube, and spins silken blinds across the ends. The pupa metamorphosis then begins. At an advanced stage, the pupæ burst their prison, and swim or creep about for a while, before undergoing the final change which lifts them from the

ranean and Atlantic coasts, and in 1455, for the Infante Henry, undertook a voyage to the Canaries and as far as the mouth of the Gambia. In 1456 he made a second voyage to Senegambia, and on the death of Prince Henry returned to Venice, where he died about 1480. His account of his discoveries was published at Vicenza in 1507.

Cadenabbia, a health resort, beautifully situated among orange and citron groves, on the west shore of Lake Como. Its famous Villa Carlotta contains works by Canova and Thorwaldsen.

Cadence, in Music, is the close of a phrase; the term being generally applied to the final two chords of the phrase. There are three principal species—viz. the perfect, the imperfect, and the interrupted cadence. The perfect, also called the whole or final cadence, is generally used at the end of a composition or of an important section. Its final chord, either major or minor, must be on the tonic (in the solfa notation, *doh*)—i.e. it must have the key-note for its bass. This is preceded by a major chord on the dominant or fifth note of the scale (*soh*), as for example :

Another form consists of the progression from the chord of the subdominant (*fa^b*) to that of the tonic, as :

These two forms were formerly distinguished as the authentic and the plagal. The latter differs only as to its place in the scale from the next species, the imperfect or half cadence, which is like a colon or semicolon, for it is used to mark the termination, not of a composition or movement, but of an idea or section. Its harmony is often that of the perfect cadence reversed, as it must end on the dominant chord, which is most frequently preceded by the tonic chord, though sometimes by other chords, such as that of the subdominant (*fa^b*).

In the interrupted or false cadence the progression of chords is such as to lead to the expectation of a perfect cadence; but instead of the tonic chord, another harmony is unexpectedly introduced, often with strange and beautiful effect. This interruption may be made in so many ways that Reicha, in his *Traté de Haute Composition Musicale*, gives 129 varieties. The following are some of those most generally used :

In modern music, a desire for continuity and freedom from commonplace, has led to the avoidance of full cadences before the conclusion of a piece of music, and to the variation and disguise of them when they do occur. An extreme instance of this may be cited in Wagner's *Tristan und Isolde*, in the whole of which opera there is only one full close—at the end of act i.

Cadency, MARK OF, in Heraldry, an addition to, or variation from, the original coat-armorial of a family, adopted for the purpose of distinguishing a cadet from the head of the house. The term is occasionally restricted to those small figures—the label (1), crescent (2), mullet (3), mantlet (4), annulet (5), fleur-de-lis (6), &c.—first introduced

into English heraldry in the reign of Henry VII., used to distinguish the eldest, second, third, fourth, fifth, sixth, &c. sons respectively, and often adopted as hereditary marks of particular junior branches of a family. Other modes of differencing cadets have been and still are used, especially in Scotland, where they form a separate branch of the study of heraldry, which is the subject of a treatise by the Scottish herald, Nisbet. See HERALDRY.

Cadenza, an ornamental flourish introduced by a soloist towards the close of a piece of music or a section of one. It is either written by the composer himself, or left to the executant; and in its more extended development, affords the latter an opportunity of displaying his powers. Remarkable instances of improvised cadenzas by both vocal and instrumental performers are on record, but they are now generally written out in full. The best cadenzas are constructed from themes already heard in the course of the work.

Cader Idris ('Chair of Idris,' a reputed giant), a picturesque mountain in Merionethshire, Wales, 5 miles SW. of Dolgelly. It consists of an immense ridge of broken precipices, 10 miles long, and 1 to 3 miles broad; the highest peak reaching an elevation of 2914 feet. It is composed of basalt, porphyry, and other trap rocks, with beds of slag and pumice. The view from the summit, which is very extensive, includes the Wrekin in Shropshire, and St George's Channel almost to the Irish coast.

Cadet, MILITARY. Cadet (Fr., through some low Lat. diminutive form, from Lat. *caput*, 'head') is a term applied in a general sense to the younger son of a noble house as distinguished from the elder. In Britain and the United States the term is generally applied to a youth studying for the army or navy at one of the military or naval colleges. In Great Britain we have also large numbers of cadets in the officers' training corps (instituted 1907); the contingents of the senior division of the corps consist of students at most of the universities, who are encouraged to qualify for reserve and territorial commissions, while the junior division consists of companies of cadets at a large number of approved schools.

Of British military cadets, those destined for the Royal Artillery or Royal Engineers study at the Royal Military Academy, Woolwich, and those for other branches of the service at the Royal Military College, Sandhurst. Among those who join the latter establishment, some are admitted on passing a qualifying examination, and educated gratuitously. These are sons of officers who have fallen in action, and left their families badly off. They are called 'King's Cadets,' or, if the father belonged to the Indian army, 'India Cadets.'

The East India Company, having its own army, used to pass its cadets through a two-year course at Addiscombe School, but after the transference to the crown of the company's powers in 1861 this system ceased, and officers for the Indian army are now supplied by volunteers from British corps, by direct appointment of cadets from the military colleges, from the special reserve, and from universities that have an approved military class. See ARMY, ARTILLERY, MILITARY SCHOOLS, and COMMISSIONS.

Cadet, NAVAL. All officers for the executive and engineer branches of the navy enter the service as naval cadets under exactly the same conditions, between the ages of 12 and 13; only after the rank of lieutenant has been reached, about the age of 22, are officers distributed amongst the three branches. The result aimed at is that community of knowledge and sentiment which can only be hoped for by early companionship and community of instruction. Cadets, entering the service after examination, are received at the Royal Naval Colleges, where they remain for four years, all receiving the same instruction, including physics and marine engineering and the use of tools and machines, and at the same time such a general education as will enable them to grasp the theory of their future studies, whichever branch they may eventually join. At the end of this period the cadets go to sea in a training cruiser, and are then drafted to the fleet as midshipmen. A direct entry system has also been established for public school boys from 17½ to 18½. They undergo a course of instruction at the Royal Naval College, Keyham, and in the training cruiser, and are then drafted to sea as midshipmen. See MIDSHIPMAN, NAVY.

Cadet's Fuming Liquor. See CACODYL.

Cadi, an Arabic word for a judge or person learned in the law; the title of an inferior judge among the Mohammedan nations. See ULEMA.

Cadillac, a city of Michigan, on a lake 90 miles N. of Grand Rapids, has lumber industries; pop 10,000.

Cadiz (Sp. *Cádiz*), a great commercial city of Spain, capital of the province of the same name, which forms a part of the great division of Andalusia, is situated at the extremity of a narrow tongue of land projecting 5 miles NW. from the Isle of Leon, 95 miles SSW. of Seville by rail, 7 miles SW. of Xeres (31 by rail). A small channel, with a draw-bridge and a railway bridge, separates the island from the mainland; at its northern outlet stands the arsenal of La Carraca, with large docks, 4 miles ESE. of the city. On the W. and S. the Atlantic Ocean washes the city, and on the N. and NE. the Bay of Cadiz, a deep inlet of the Atlantic, forming an outer and an inner bay. The town, which is walled and defended from the sea both by a series of forts and by low shelving rocks, is about 2 miles in circuit, and presents a remarkably bright appearance, with its shining granite ramparts, and its whitewashed houses crowned with terraces and overhanging turrets. Many of these flat roofs are also used as cisterns, the town being poorly supplied with water, which is brought from Santa Maria, 6 miles to the N. by sea, and 19 by rail. The streets are well paved and lighted, regular, but narrow, and there are some pleasant public walks, the most frequented of which is the Alameda, by the seaside. Cadiz has few public buildings of note: its two cathedrals are indifferent specimens of ecclesiastical architecture, but possess some excellent pictures by Murillo; while the custom-house, naval, and other schools, observatory, signal-tower, alms-houses, hospitals, and bull-ring are distinguished rather for excellent management than for architectural beauty. It reached its highest

prosperity after the discovery of America, when it became the *dépôt* of all the commerce with the New World; declined greatly as a commercial city after the emancipation of the Spanish colonies in South America; again revived, owing to the extension of the Spanish railway system, and to the establishment of new lines of steamers; and again suffered from the loss of Cuba and the preceding wars. Since then the town has directed much of its attention to shipbuilding and manufactures, and improved its port. The exports consist of salt, cork, lead, wine, tunny-fish, olive-oil, and fruits. The manufactures are glass, woollen cloth, leather, soap, hats, gloves, fans, &c. Pop. (1860) 71,521; (1879) 65,028; (1897) 70,177; (1920) 76,818.

Cadiz is one of the most ancient towns in Europe, having been built by the Phœnicians, under the name of Gaddir ('fortress'), about 1100 B.C. It afterwards passed into the hands of the Carthaginians, from whom it was captured by the Romans, who named it Gades, and under them it soon became a city of vast wealth and importance. Occupied afterwards by the Goths and Moors, it was taken by the Spaniards in 1262. In 1587 Drake destroyed the Spanish fleet in the bay; nine years later, Cadiz was pillaged and burned by Essex; and in 1625 and 1702 it was unsuccessfully attacked by the English. From 1808 the headquarters of the Spanish patriots, Cadiz was blockaded by the French from February 1810 until August 25, 1812, when the victories of Wellington forced them to raise the siege. It was captured in 1823 for Ferdinand VII. by the French, who held it till 1828; and it was the birthplace of the Spanish revolution of 1868, as well as the scene in 1873 of an Intransigente rising.

Cadmia is the term applied to the crust formed in zinc furnaces, which contains from 10 to 20 per cent. of cadmium.

Cadmium (sym. Cd, atomic weight 112) is a metal which occurs in zinc ores. In the preparation of zinc, when heat is applied, the cadmium, being more volatile than that metal, rises in vapour, and distils over with the first portions of the metal (see ZINC). It can be got also by electrolysis from cadmium sulphate. It is a white metal, somewhat resembling tin, than which it is rather denser, its specific gravity being 8.6. It is very soft, and is malleable and ductile, crackling like tin when a rod of it is bent. It fuses at 315° C., and volatilises a little below the boiling-point of mercury. There are alloys of cadmium with various other metals. Several of its salts have been serviceable in medicine, and the iodide and bromide have been useful in photography. The sulphide of cadmium, CdS, occurs naturally as the mineral *Greenockite*, and when prepared artificially is of a bright yellow colour. It is known as Cadmium Yellow, and is of great value to the artist. A great variety of tints are produced by mixing it with white-lead. Much of what is sold as Naples Yellow is thus prepared, but the genuine Naples Yellow, prepared by heating antimonious anhydride with plumbic oxide, has a greenish tint. See YELLOW.

Cadmus, in Greek Mythology, the son of Agenor and Telephassa, and brother of Europa. When the latter was carried off by Zeus, he was sent by Agenor in quest of her, with injunctions not to return without her. The search was vain, and the oracle at Delphi told Cadmus to relinquish it, but to follow a cow of a certain kind which he should meet, and build a city where it should lie down. He found the cow in Phocis, followed her to Boeotia, and built there the city of Thebes. Intending to sacrifice the cow to Athena,

he sent some men to the well of Ares hard by for water, but they were killed by the dragon, a son of Ares, who guarded it. Cadmus then slew the dragon, and sowed its teeth in the ground. From these sprang up armed men who slew each other until but five were left, who became the progenitors of the Theban families. To Cadmus (perhaps a Phœnician name) was ascribed the introduction of the Alphabet (q.v.) into Greece.

Cadorna, COUNT LUIGI, born 1850, Italian chief of staff (1914) and commander-in-chief from 1915 to the Caporetto collapse. See his *La Guerra alla Fronte Italiana* (1921).

Cadoudal, GEORGES, a distinguished leader of the Chouans (q.v.), was born near Auray, in Lower Brittany, where his father was a miller, in 1771. He was among the first to take up arms against the Republic, and soon acquired great influence over the peasants. Captured in 1794, he escaped, became leader of the insurgents in Lower Brittany, and organised an army in which no noble was permitted to command, and which Hoche, with all his generalship, was unable to subdue or disperse. After an apparent submission in 1796, he renewed the revolt in Brittany in 1799, but was compelled to submit, and to dismiss his forces, in February 1800. Bonaparte recognised his energy and force of character, and endeavoured to secure his services; but Cadoudal refused his offers, and passed over to England, where the Comte d'Artois appointed him a lieutenant-general, and where, in 1802, he conspired with Pichegru for the overthrow of the First Consul. With this design he went to Paris, but was arrested, condemned, and guillotined, June 25, 1804. He was a man of stern honesty and indomitable resolution. 'His mind was cast in the true mould; in my hands he would have done great things,' said Napoleon of him. After the Restoration, his family was ennobled. It has been held that the British government, or at least some of its members, knew of and abetted his plot to murder Napoleon.

Caduceus, the winged staff of Hermes (Mercury), which gave the god power to fly. Originally a simple olive branch, its stems were afterwards formed into snakes, and several poetical tales devised by the mythologists to explain this, as that Hermes having found two snakes fighting, divided them with his rod, and thus they came to be used as an emblem of peace. It was the staff or mace carried by heralds and ambassadors in time of war. It was not used by the Romans. Many magical virtues were ascribed to the caduceus; in Homer, Hermes touches with it the souls of the dead, and so lulls them to sleep before carrying them to the under-world. It is also seen in the hands of Ares (Mars), Dionysus, Hercules, Demeter, and Aphrodite.

Caduceus.

Cadwalladr, a Welsh prince who, blinded by Irish pirates, resisted Henry II., and died in 1172.

Cadzand, or CADSAND, now a small port of Zeeland in Holland, near the Belgian frontier. It was a great mediæval port; and here in 1337 the English, under Sir Walter Manny and the Earl of Derby, defeated the Flemings in French pay.

Cadzow. See HAMILTON.

Cæcilia (Lat. *cæcus*, 'blind'), a genus of serpent-like amphibians, type of a small order of Gymnophiona, in which the body is worm-like, without tail or limbs, with transversely furrowed skin, and usually with small hidden scales. Their striking serpent-like appearance, suggestive too of the lizard

slow-worm (*Anguis*), is simply an adaptation to similar semi-subterranean habits. The mouth is small, on the under side of the snout; there is an opening with a curious sensory organ beside each nostril; the eyes are not absent nor anatomically incomplete, but small and hidden under the skin; the tympanum and tympanic cavity are absent. Teeth are borne by jaws and gums; the tongue is fixed. The vertebral bodies are biconcave; the skull has two condyles; rudimentary ribs are borne by all the vertebrae except the first and last. Huxley notes that certain peculiarities in the skull are foreshadowed by the extinct giant amphibians or Labyrinthodonts. The cloaca is at the end of the tailless body. Rudimentary limb buds have been observed beside the cloaca. As in snakes, the right lung is much better developed than the left. That they are really amphibians is proved not merely by their anatomy, but by the gills borne by the young forms. In *Ichthyophis* (*Epicrion*) there are three beautiful plumose gills on each side; in *Typhlonectis*, a single pair, which used to be described as sacs, but are really leaf-like. They inhabit warm countries and damp places, burrow like earthworms, and eat worms and insects. About thirty species are known, and are very widely distributed. *Cæcilia* itself is a South American genus, about 20 inches in length, and the thickness of a large worm; *Epicrion* is found in Ceylon, Mexico, and Brazil; and *Siphonops* (over two feet in length) buries deeply in the soft earth of Brazil and elsewhere. The genera, of which 11 altogether are distinguished, are peculiarly divided; thus 5 species of *Dermophis* are American, and one is African. These animals should hardly be called 'blindworms.' It must be clearly recognised that the *Gymnophiona* (*Cæcilia*, &c.) are amphibians, the blindworms or slow-worms (*Anguis*) and the *Amphisbænidae* are lizards, and that all have a superficial adaptive resemblance to snakes.

Cæcilian. See DONATISTS.

Cæcum (Lat. *cæcus*, 'blind'), a general term for any blind sac arising from the gut. Such outgrowths are common in many different classes of animals. The gut being a tube lined by cells in very favourable nutritive conditions, and being at the same time limited in its growth at both ends, it is easy to understand why it should develop outgrowths, or become twisted upon itself in the way it does. Insects and starfishes afford good illustrations of cæca attached to the gut of invertebrate animals. Among backboned animals cæca occur on all the three divisions of the gut. (a) The crop of birds is a more or less marked cæcum or outgrowth of the fore-gut. The stomach itself is frequently, as in many fishes, of the nature of a cæcal sac from the general course of the fore-gut. The complex stomach of ruminants, &c. illustrates the same sort of formation. (b) The digestive cæca at the beginning of the small intestine in many fishes are good examples of outgrowths from the mid-gut. (c) At the union of small and large intestine (hind-gut), cæca are often given off in reptiles, birds, and mammals. Those of birds are usually two in number, and vary greatly from mere papillæ to long tubes. The cæcum of mammals is usually single. It varies greatly with the diet, being short for instance in carnivora, absent altogether in bears and weasels, but long in herbivorous animals. As a hollow sac continuous with the rest of the intestine, it delays the passage of the food, which is thus subjected to longer

Cæcilia compressicauda.

digestion and absorption. In man the cæcum terminates in a small appendage which has not grown in proportion with the rest, and is well known as the appendix vermiformis. Besides the above structures to which the term is often applied (especially to those of the hind-gut), it may be noted that the lungs are outgrowths from the fore-gut, the liver a paired outgrowth from the mid-gut, the allantois an outgrowth from the hind-gut. In their primitive embryonic stages, and in their first appearance—e.g. as air-bladder of fish, hepatic sac of lancelet, bladder of frog—these may be fairly described as cæca. For other information, and for the human cæcum, see DIGESTION, and the other articles named at BOWELS.

Cædmon was the first identifiable English writer of note who used his own language, and the first religious poet of the Teutonic race. All that we know of him is from Bede, who devotes to him a chapter of his *History* (book iv. 24). He died about 680 A.D. In Bede's account, written not more than sixty years after his death, we are told that Cædmon, until he was of mature age, had never learned any poem, and that sometimes when at festivals his turn came to take the harp and sing, he would rise from the feast and go home. On one such occasion, having gone out to the stables of the beasts, which it fell to him that night to guard, and sleeping at his watch, he had a vision, in which one stood by him and said, 'Cædmon, sing me some song!' 'I cannot sing,' he said, 'for this cause I have come out hither from the feast.' 'But you shall sing to me!' 'What,' asked Cædmon, 'ought I to sing?' 'Sing the beginning of created things.' And straightway a poetic inspiration seized him, and he began to pour forth verses in praise of God, of which Bede adds, 'this is the sense, though not the order: "Now ought we to praise the author of the Heavenly Kingdom, the Creator's might and counsel, the works of the Father of Glory; how through the Eternal God he became the author of all wondrous things; Almighty Guardian, who for men's sons created first heaven for their roof, and then the earth." When he awoke from his dream, the words remained fast-rooted in his memory, and were recited by him to others with new confidence. He was taken before Hilda, abbess of Streaneshalch (now Whitby), when she and the learned men who were with her in the monastery immediately declared that he had received the gift of song from Heaven. He was now educated, became a monk, and spent the rest of his life in composing poems on the Bible histories and on miscellaneous religious subjects, a long list of which is given by Bede, who says that in all he wrote 'his care was to draw men away from the love of evil deeds, and excite them to the love of well-doing;' and that 'none of those who tried after him to make religious poems could vie with Cædmon, for he did not learn the poetic art from men, but from God.'

Of the so-called Cædmonian poems there is extant but a single MS. of the 10th century (Cod. Jun. xi.) in the Bodleian, consisting of 229 folio pages, 212 of which contain the account of the creation and the fall of the angels and of man, and the story of Genesis down to the offering of Isaac, together with a description of the Exodus of Israel, and part of the book of Daniel, ending with Belshazzar's feast; the remaining pages comprise a poem of Christ and Satan—a description of the 'Harrowing of Hell.' It is certain that this poetry, at least in its present form, is due to various authors, and probably to different times. Genesis has been divided by modern scholars into two portions, of which *Genesis B* is an interpolation from an Old Saxon source. Of the Old Testament pieces the critics hold that *Exodus* is the oldest, *Daniel* probably next, *Genesis A* and *B* the latest.

Whether Cædmon wrote any of these is not a question to which any confident answer can yet be given. The MS. was given by Archbishop Ussher to Franciscus Junius, by whom it was printed for the first time at Amsterdam in 1655, twelve years before the first edition of *Paradise Lost*, to some parts of which it bears a striking resemblance. Satan's Speech in Hell is characterised by a simple yet solemn greatness of imagination, which may possibly have influenced in some degree the more magnificent genius of Milton. The beginning of this MS. differs considerably from the English verses given by Alfred in his translation of Bede as the opening of Cædmon's poem, as well as from the Northumbrian version appended to an 8th-century MS. of Bede in the university of Cambridge. Dr George Hickes was the first to doubt the identification of the extant paraphrase with the work of Bede's poet; the elder Disraeli in his *Amenities of Literature* supposes the account of Cædmon's inspiration to be a monkish fiction devised for gain; and the learned Palgrave notes with idle ingenuity (*Archæologia*, xxiv. 342; Lond. 1832) that as the Jews call Genesis (from its first two words) *Bereshith*, and the Chaldee Targum of Onkelos names it *Be-Kadmon* ('in the beginning'), the latter word may be the origin of the name given to the English versifier of Genesis. The fine poem known as *The Dream of the Rood*, part of which in Northumbrian is inscribed in runic letters on the Ruthwell cross, while the remainder was discovered in a MS. at Vercelli, was ascribed to Cædmon by Haigh (1856), and by Stephens (1866), who erroneously read his name upon the topmost stone; but this theory is now abandoned, and the poem generally attributed to Cynewulf (q.v.). Very little was done from Hickes's death in 1715 down to 1830, when the attention of English scholars was again directed to it by Grundtvig. Editions of the Cædmonian poems have been published by Thorpe, with modern Eng. trans. (Lond. 1832); Bouterwek (Elberfeld and Gütersloh, 1851 and 1854); Grein, in his *Bibliothek der angelsächsischen Poesie* (Gött. 1857-64; revised by Wulker, 1894); the *Exodus* and *Daniel*, by T. W. Hunt (Boston, 1883; 2d ed. 1885), and by F. A. Blackburn (Boston, 1907). See Blackburn's introduction and bibliography; also Bernhard ten Brink's *History of English Literature* (vol. i. 1877), Morley's *English Writers* (vol. ii. 1888), Henry Bradley in vol. viii. of *Dict. Nat. Biog.* (1886), Stopford Brooke's histories of early English literature (1892 and 1898), vol. i. of the *Cambridge English Literature* (1907), and Kennedy's prose translation of the poems (1916).

Caen, the chief town in the French department of Calvados, and the former capital of Lower Normandy, is situated on the left bank of the navigable Orne, here joined by the Odon, 9 miles from its mouth, 149 W. by N. of Paris, and 83 ESE. of Cherbourg. It has wide clean streets, a fine central square, with a statue of Louis XIV., charming promenades, and many noble specimens of mediæval architecture. Among Caen's churches are those of St Etienne and La Sainte Trinite, both Romanesque in style, founded in 1066 by William the Conqueror and his queen Matilda, and containing their graves, which the Huguenots violated in 1562; St Pierre (1308-1521), with an exquisite spire 242 feet high; St Nicholas, now desecrated; and St Jean. The castle, founded by the Conqueror, and finished by Henry I. of England, was dismantled in 1793, and now serves as a barrack. The university (1809) is successor to one founded by our Henry VI. in 1436; and in the Hôtel de Ville are a library and a fine collection of paintings (its gem Perugino's 'Marriage of the Virgin'). The chief manufacture is lace. Iron ore is exported, coal

imported. A maritime canal connects the port with the sea. Nothing is known of Caen before the 9th century. It was a place of importance in 912, when it came into the possession of the Normans, under whom it increased rapidly. William the Conqueror and his queen made it their residence, and greatly improved it. In 1346, and again in 1417, it was taken by the English, who held it till 1450. In 1793 several of the Girondist chiefs, proscribed by the Jacobins, went to Caen, and organised an unsuccessful revolt against the 'Mountain' (q.v.). Malherbe, Huet, and Auber were natives (a marble statue of the last was unveiled in 1883); Charlotte Corday lived here; and Beau Brummel died in the lunatic asylum. Pop. 54,000.

The excellence of the oolitic Caen Stone from the great quarries here, and the facility of transport by sea, led to its being largely used in England; Winchester and Canterbury Cathedrals, Henry VII.'s Chapel at Westminster, and many country churches are built of it, and it is still in demand in England. See BUILDING STONE.

Cænolestes, a genus of Marsupials (q.v.) comprising two species found in Ecuador and Colombia, small shrew-like animals with a small pouch. With other genera found as fossils in Patagonia, it forms the family Epanorthidæ.

Caere. See CERVETRI.

Caergwle (pron. *Ca-er-goor'leh*), 5 miles NNW. of Wrexham, was one of the Flint boroughs.

Caerlaverock, a splendid ruined castle near the mouth of the Nith, 7 miles SSE. of Dumfries. For more than four centuries the seat of the Maxwells, earls of Nithsdale (1620-1716), and still the property of their representative, Lord Herries, it was captured by Edward I. in 1300. Robert Paterson, Scott's 'Old Mortality,' was buried in the churchyard in 1801. See Sir W. Fraser's *Book of Caerlaverock* (2 vols. 1873).

Caerleon ('castle of the legion'), a small but ancient town in Monmouthshire, on the right bank of the Usk, 2½ miles NE. of Newport. The *Isca Silurum* of the Romans, it was very early the seat of an ancient see—the only one, it seems, in all Wales—which was transferred to St David's in the 6th century. An abbey of Cistercian monks existed here before the Reformation. Many Roman relics have been found, as baths, pavement, altars, tiles, coins, inscriptions, and enamels; and the smaller of these are deposited in a museum. There are also remains of an amphitheatre, measuring 222 by 192 feet, and known as King Arthur's Round Table. Geoffrey of Monmouth it was who connected King Arthur with Caerleon; and to that connection, through Lord Tennyson, Caerleon owes its chief fame. Pop. 2000. See J. E. Lee's *Isca Silurum* (Lond. 1845).

Caermarthen, Caernarvon. See CARMARTHEN, CARNARVON.

Cæsalpinia, a large genus of leguminous trees, the type of the essentially tropical sub-order Cæsalpinieæ (see LEGUMINOSÆ). The sub-order consists largely of trees, among which many are notable for their purgative properties, as Senna; some produce edible fruits, as the Tamarind, the Carob, and the West Indian Locust tree; some yield resinous and balsamic products, as Copaiba, Copal (*Hymenæa* and *Copaiba*); some produce important dye-woods, as Logwood, Brazil-wood; and some are trees of great size, and very valuable for their timber. The genus contains a number of important trees, notably *C. echinata* (*brasiliensis*), which yields the Brazil-wood, Penambuco Wood; and *C. sappan*, the Sappan-wood of commerce; also *C. coriaria*, which supplies the astringent pods called Dividivi (q.v.), used in

tanning. The various species named are dealt with in separate articles.

Cæsalpinus, the Latinised form of the name of Andrea Cesalpino, an eminent botanist and physiologist, born at Arezzo, in Tuscany, in 1519. He made his studies at Pisa, afterwards lectured there, and had charge of the botanical museum. He died early in 1603 at Rome. His fame depends on his work, *De Plantis Libri XVI.* (Florence, 1583), which commenced a new epoch in systematic botanical science, and supplied many hints to the great Linnæus. See Sachs, *Geschichte der Botanik*.

Cæsar, the title of the Roman emperors and of the heirs to the throne, was originally the name of a patrician family of the *Julia Gens*, one of the oldest in the Roman state, claiming to be descended from Iulus, the son of Æneas. Octavian bore the name as the adopted son of the great Julius Cæsar, and handed it down to his own adopted son, Tiberius; after whom it was borne by Caligula, Claudius, and Nero. Although the Cæsarian family proper became extinct with Nero, the title of Cæsar was part of the style of the succeeding emperors, usually between Imperator and the personal name, as 'Imperator Cæsar Vespasianus Augustus.' When the emperor Hadrian adopted Ælius Verus (136), the latter was permitted to take the title of Cæsar; and from this time in the western, and afterwards also in the eastern, empire it was borne by the heir-apparent to the throne, while Augustus continued to be the exclusive name of the reigning emperor. It is hardly necessary to mention that the name reappears in the *Czar* or *Tsar* of Russia and of Bulgaria, in the *Kaiser* of the 'Holy Roman Empire' and of the German and Austrian empires, and in the *Kaisar-i-Hind* or emperor of India.

Cæsar, GAIUS JULIUS, son of a Roman prætor of the same name, was born 12th July 100 B.C., according to Mommsen in 102 B.C. His circumstances and connections made him a resolute adherent of the democratic party at Rome. His aunt Julia was wife of Caius Marius; and in 83 B.C. Julius himself was married to Cornelia, daughter of Lucius Cinna, one of the principal enemies of Sulla. The anger of the dictator at this marriage cost Cæsar his rank, property, and almost his life itself. Feeling that he would be safer abroad for a time, he went to Asia, 81 B.C.; but on learning the death of Sulla (78 B.C.), he hurried back to Rome, where he found the popular party in a state of great ferment, and anxious to regain what it had lost under the vigorous despotism of the aristocratic dictator. Cæsar, however, took no part in the attempts of Lepidus to overthrow the oligarchy; but he showed his political leanings by prosecuting (77 B.C.) Cnæus Dolabella—a great partisan of Sulla—for extortion in his province of Macedonia. To improve his eloquence, he went to Rhodes to study under the rhetor Apollonius Molo.

In 74 B.C. he returned to Rome, where he had been elected pontifex, and now for the first time threw himself earnestly into public life. He soon became the most active leader of the democratic party, and had a large share in effecting the agreement by which Pompey and Crassus accepted the popular policy. The result was the overthrow of the Sullan constitution in 70 B.C., and the restoration of popular institutions such as the tribunate. In 68 B.C. Cæsar obtained a questorship in Spain. On his return to Rome

(67 B.C.), he married Pompeia, a relative of Pompey, with whom he was daily becoming more intimate. In 65 B.C. he held the curule ædileship, and lavished vast sums of money on games and public buildings, by which he increased his already great popularity. For the next few years Cæsar is found steadily active on the popular side. In 63 B.C. he was elected pontifex maximus, and shortly after, prætor. During the same year occurred the famous debate on the Catiline conspiracy, in which the aristocratic party vainly endeavoured to persuade the consul, Cicero, to include Cæsar in the list of conspirators. It is believed by some that he was at least indirectly concerned in the conspiracy. In 62 B.C. Pompey returned from the East, and disbanded his army. Next year Cæsar obtained the province of Hispania Ulterior. His government of that province was useful to him as giving him military experience and supplying the means wherewith to meet his enormous debts. On his return he was elected consul, along with Calpurnius Bibulus.

With rare tact and sagacity Cæsar reconciled the two most powerful men in Rome, who were then at variance, Pompey and Crassus, and formed an alliance with them, known in history as the *First Triumvirate* (60 B.C.). Cæsar's proceedings during his consulship were marked by this policy of friendship to Pompey; he passed an agrarian law by which Pompey's veteran soldiers chiefly profited, and he obtained the ratification of that general's acts in the East. To strengthen the union which had been formed, Cæsar gave Pompey his daughter Julia in marriage, though she had been promised to Brutus; while he himself also married Calpurnia, daughter of Piso, his successor in the consulship. On the expiry of his term of office, he obtained for himself, by the popular vote, the province of Gallia Cisalpina and Illyricum for five years, to which the senate added—to prevent the popular assembly from doing so—the province of Gallia Transalpina. Nothing could have been more favourable for Cæsar's aims. He had now an opportunity of developing his extraordinary military genius, and of gathering round him an army of veterans, whom perpetual victory should inspire with thorough soldierly fidelity and devotion to his person. This was the very thing he wanted to give him a reputation equal to that of his coadjutors, Pompey and Crassus, whom in genius he far surpassed.

In 58 B.C. Cæsar repaired to his provinces, and during the next nine years conducted those splendid campaigns in Gaul by which he completed the subjugation of the West under the dominion of Rome. In his first campaign he defeated the Helvetii, and also Ariovistus, who with a large number of Germans had settled west of the Rhine. In 57 B.C. Cæsar broke up the Belgic confederacy and subdued the various tribes composing it, the greatest struggle being with the Nervii. When the senate received Cæsar's official despatches, it decreed a thanksgiving of 15 days—an honour never previously granted to any general. During the winter and the spring following Cæsar stayed at Luca, where he had a memorable meeting with Pompey and Crassus, and for three years following agreed upon a common policy. It was decided that Pompey and Crassus should be consuls for the year 55 B.C., while the government of Cæsar in Gaul was to be prolonged, for a second term of five years till 49 B.C. In the year 56 B.C. followed the subjugation of the Veneti and other peoples of Brittany and Normandy, and the conquest of Gaul might be considered complete. He now undertook a fourth campaign against two German tribes who were about to enter Gaul. He was again successful; and pursuing the fleeing

enemy across the Rhine, spent eighteen days in plundering the district inhabited by the Sigambri. In the autumn of the same year (55 B.C.) he invaded Britain; but after a brief stay in the island, returned to Gaul. The Roman senate, astonished at his hardihood and his successes in regions where no Roman army had ever been before, accorded him a public thanksgiving of 20 days. In 54 B.C. Cæsar opened his fifth campaign by a second invasion of Britain, in which he crossed the Thames, and enforced at least the nominal submission of the British tribes in the south-east of the island. On his return to Gaul, Cæsar was compelled—on account of the scarcity of corn—to disperse his forces for winter quarters, and this encouraged some of the Gallic tribes to revolt. It led to the first serious reverse which Cæsar sustained in Gaul; a division of fifteen cohorts was entirely destroyed by the Eburones. But he was speedily master of the insurrection, and exacted a terrible vengeance on its authors. Cæsar now returned to Northern Italy, that he might be able to communicate more easily and securely with his friends at Rome. That city was gradually becoming more anarchic, the evils of weak government more apparent; the hour for decisive action seemed to be approaching, when there broke out a general rebellion of the Gauls, headed by a young warrior of the Arverni named Vercingetorix. It was in the dead of winter when the news came to Cæsar. Without delay he crossed the Cevennes mountains, though they were covered with snow to the depth of six feet. The struggle with Vercingetorix was a severe one; at Gergovia, the capital of the Arverni, Cæsar was defeated, and for a time his affairs seemed in a desperate condition. But he managed to unite his forces, and at the siege of Alesia (52 B.C.) crushed the whole hosts of the Gauls. Vercingetorix surrendered himself, and the independence of Gaul was at an end. Only some isolated tribes continued to resist; and next year (51 B.C.) Cæsar proceeded to quell them. This he successfully accomplished, and having in addition reduced the whole of Aquitania, passed the winter of his eighth campaign at Nemetocenna, in Belgium, where he spent the time in a magnanimous and politic manner. The Gallic princes were courteously and generously treated, and generally a mild system of government was set up, which made the Roman yoke as easy as possible. This was all the more necessary, as affairs at Rome urgently demanded attention. He took up his residence at Ravenna, where he was informed of everything that was going on by the tribune Curio, whose support he had purchased.

In the meantime Pompey had definitely gone over to the senatorial party. Many causes had contributed to this change of attitude. Pompey's wife, Cæsar's daughter Julia, was dead. Crassus had fallen in Asia in 53 B.C., and thus Cæsar and Pompey were left alone, the two most powerful men of Rome. Pompey was jealous of his younger rival. His natural tendency was to adhere to the old aristocratic party. He now cast in his lot with it, and it was decided to break the power of Cæsar. With this view it was necessary to deprive him of his command in Gaul. During the long manœuvring which followed, Cæsar acted with the greatest moderation, and managed to throw upon his opponents the responsibility of violating the law. Under the direction of Pompey the senate summarily called upon him to resign the command and disband his army. The tribunes Mark Antony and Cassius put their veto on this motion; but they were violently driven out of the senate-chamber, and fearing for their lives, they fled to Cæsar's camp. Things had now come to an extremity. The senate intrusted Pompey with the

duty of providing for the safety of the state. His forces far outnumbered Cæsar's legions, but they were scattered over the provinces of the empire, and the Italian levy was unprepared. In face of an enemy of such marvellous promptitude and energy as Julius Cæsar this dilatoriness was fatal. Perceiving that the time for energetic action had at length arrived, Cæsar harangued his victorious troops, who were willing to follow him anywhere; crossed the Rubicon (a small stream which separated his province from Italy Proper), and moved swiftly southwards. Pompey fled to Brundisium, pursued by Cæsar, but contrived to reach Greece in safety, 17th March, 49 B.C. The Italian cities everywhere opened their gates to the conqueror. In three months Cæsar was master of all Italy.

Cæsar next subdued Pompey's legates in Spain, who were at the head of considerable forces. On his return, he took Massilia, where he learned that he had been appointed dictator of the republic—a function which at this time he retained only for eleven days, but these were honourably distinguished by the passing of several humane enactments. Pompey, now thoroughly alive to the magnitude of his danger, had gathered in Egypt, Greece, and the East, a powerful army, while his fleet swept the sea. Cæsar, however, crossing the Adriatic at an unexpected season, made a rush for Dyrrhachium, where Pompey's stores were; but was nevertheless outstripped by his opponent. Pompey intrenched his army on some high ground near the city, where he was besieged by Cæsar. The first encounter was favourable to Pompey, who drove back Cæsar's legions with much loss. The latter now advanced into Thessaly, followed by his exulting enemies. A second battle ensued on the plains of Pharsalia, 9th August, 48 B.C. The senatorial army was utterly routed; and Pompey himself fled to Egypt, where he was murdered. See POMPEY.

No sooner had the news reached Rome, than Cæsar was again appointed dictator for a year, and consul for five years. He was invested with tribunician power for life, and with the right of holding all the magistratual comitia except those for the election of the plebeian tribunes. He did not, however, return to Rome after the battle of Pharsalia, but went to Egypt, then in a distracted condition on account of the disputes regarding the succession. Out of love for Cleopatra (who subsequently bore him a son), he entered upon the 'Alexandrine War,' in which he was successful, and which he brought to a close in March 47 B.C. He next overthrew a son of Mithridates, near Zela, in Pontus, August 2 of the same year, and arrived in Rome in September. He was once more appointed dictator, and the property of Pompey was confiscated and sold. Before the close of the year he had set out for Africa, where his campaign against the Pompeian generals, Scipio and Cato, was crowned with victory at the battle of Thapsus, April 6, 46 B.C. Cato committed suicide at Utica, and with such irresistible celerity was the work of subjugation carried on, that by the end of the summer Cæsar was once more in Rome. Now occurred that display of noble and wise generosity for which Cæsar may be regarded as truly great. He was not a man that could stoop to the vulgar atrocities of Marius or Sulla; he majestically declared that henceforth he had no enemies, that he would make no difference between Pompeians and Cæsarians. His victories in Gaul, Egypt, Pontus, and Africa were celebrated by four great triumphs, during which the whole Roman populace was feasted and fêted by the magnificent liberality of the dictator.

Cæsar now proceeded with his schemes for the settlement of affairs at Rome. During the year 46 B.C. he conferred a benefit on Rome and on the

world by the reformation of the calendar, which had been greatly abused by the pontifical college for political purposes. After quelling an insurrection which broke out in Spain, where Pompey's sons, Cneius and Sextus, had collected an army, he received the title of 'Father of his Country,' and also of *imperator*, was made dictator and *præfectus morum* for life, and consul for ten years; his person was declared sacred, and even divine; he obtained a body-guard of knights and senators; his statue was placed in the temples; his portrait was struck on coins; the month Quintilis was called Julius in his honour; and on all public occasions he was permitted to wear the triumphal robe. He proposed to make a digest of the whole Roman law for public use, to found libraries for the same purpose, to drain the Pontine Marshes, to enlarge the harbour of Ostia, to dig a canal through the Isthmus of Corinth, and to quell the inroads of the barbarians on the eastern frontiers; but in the midst of these vast designs he was cut off by assassination on the Ides (15th) of March, 44 B.C. Of the sixty aristocrats who were in the conspiracy, many had partaken of Cæsar's generosity, and all of his clemency. A few, like Brutus, out of a weak and formal conscientiousness, based on theory rather than insight, were probably offended by Cæsar's desire to change the form of government into a hereditary monarchy; but the most, like Cassius, were inspired by very ordinary motives.

Cæsar, who was fifty-six years of age when he was murdered, was of a noble and kingly presence, tall of stature, with a countenance which, though pale and thin with thought, was always animated by the light of his black eyes. He was bald-headed (at least in the latter part of his life), wore no beard, and though of a rather delicate constitution naturally, he ultimately attained to the most vigorous health. In the completeness and variety of endowments he has had no equal. Both as general and statesman he takes a foremost place in the annals of the world; and excepting Cicero, he was the greatest orator of his time. As a historian, he has never been surpassed and rarely equalled in simplicity and in the terse directness and dignity of his style. He was, in addition, a mathematician, philologist, jurist, and architect, and always took great pleasure in literary society. The importance of Julius Cæsar in history depends chiefly on the work he did in the transformation of the Roman state from a republic to the rule of a single chief. The republican government of Rome was intended for a city with a limited population of burgesses and dependents. As its rule widened, this form of government proved more and more inadequate to the altered circumstances. Under the new conditions due unity and energy in the administration could be attained only through the rule of a single chief resting ultimately on the military power. During the anarchy of the later republic this was becoming apparent. Cæsar saw it with greater clearness than any of his contemporaries, and he had the genius and energy to bring it almost to realisation. His policy was on the whole the same as that more cautiously pursued by Augustus, to concentrate in his person the chief offices of state, and thus to establish a single rule under the old republican forms. Such a transformation was inevitable; and Cæsar, in the course he followed, simply brought the tendencies of the time to their own proper development. He was a realist statesman who worked towards attainable ends by such means as were available. Yet he showed a clemency and generosity of temper, a humanity and serene superiority to the mean and vulgar passions of the time, that in a moral point of view decidedly raise him above the level of his contemporaries.

Of Cæsar's works the Commentaries on the Gallic and Civil wars alone have been preserved. See Mommsen's *Roman History* (Eng. trans. 1866), and Drumann's *Geschichte Roms*; the works of Merivale and Arnold; *Histoire de Cæsar*, by Napoleon III.; Froude's *Cæsar*; Stoffel, *Histoire de Jules Cæsar* (1888); W. W. Fowler, *Julius Cæsar and the Foundation of the Roman Imperial System* (1892); Col. T. G. Dodge, *Cæsar* (1893). T. Rice Holmes, *Cæsar's Conquest of Gaul* (2d ed. 1911), and his *Roman Republic and the Founder of the Empire* (1923).

Cæsar, SIR JULIUS, judge, born at Tottenham in 1558, was the son of Cesare Adelmare, physician to Queen Mary. He was called to the bar in 1580, and was appointed judge of the Admiralty Court in 1584, Chancellor of the Exchequer in 1606, and Master of the Rolls in 1614. He sat in six parliaments, was knighted in 1603, and died 18th April 1636. The close friend of Whitgift, and afterwards of Bacon, he has left a higher reputation for superiority to bribery than for legal acumen; and his lavish bounty to all beggars is related to have rendered the loan of his coach, so well known to this fraternity, an expensive favour for his friends. He wrote on the Court of Requests and the Privy-council.

Cæsare'a (now *Kaisariyeh*), in the vilayet of Angora, has played an important part in the history of Asia Minor. On the great trade route from the Black Sea coast to the Euphrates, and on the Roman road from Ephesus to the east, it is still an important commercial centre (pop. 50,000). It was a Hittite capital and, as Mazaca, capital of the kings of Cappadocia; was taken by the Armenians; and when it had 400,000 inhabitants (260 A.D.) destroyed by the Persians. St Basil was bishop here.—**CÆSAREA PALESTINA**, once a splendid seaport on the coast of Palestine, 30 miles N. of Joppa, was built by Herod about 22 B.C., and named in honour of Cæsar Augustus. It was a Greek town, with temples, amphitheatre, baths, and a well-protected harbour. It was the see of Eusebius in the 4th century, and here the Crusaders built a cathedral. Amidst its ruins are a few miserable houses inhabited by fishermen.—**CÆSAREA PHILIPPI** was situated about 95 miles N. of Jerusalem, near the source of the Jordan. Its suffix was given in honour of Philip the Tetrarch, who repaired the city. The modern village of Paneas, or Baniyas, stands on its ruins. It has been identified with Baalgad or Beth-Rehob.

Cæsarean Operation has from very ancient times been the popular name for *Hysterotomy*. Pliny distinctly alludes to it in his *Natural History* (lib. vii. cap. ix.), saying that the first of the Cæsars was so called from being taken by excision out of the womb of his mother. It is often stated that Julius Cæsar came into the world in this way—a very doubtful story—and that the operation took its name from him. Tradition ascribes to Numa Pompilius a decree that every pregnant woman who died should be opened. The church council at Durham in 1220 laid down the conditions under which the operation was justifiable; and the Senate of Venice in 1608 decreed that practitioners should perform, under heavy penalties, the Cæsarean operation on pregnant women supposed to be dead. In 1749 the king of the Two Sicilies decreed the punishment of death to medical men who omitted to perform it on women dying when advanced in pregnancy. Of course, to be of any use, it must be performed immediately.

In the case of a living woman the risk to the child's life is slight, but to the mother's very great indeed. Still, many cases are on record where not only the child but the mother was saved. Some women, indeed, seem to have accepted it as their usual method of delivery, having several children, each requiring to be removed through an

abdominal incision; one woman submitted to it seven times. It has also been successfully performed in most unfavourable circumstances. An illiterate Irish midwife operated with a razor on a poor farmer's wife in 1738, removing a dead child, and her patient completely recovered; and cases are known in which women have operated on themselves with perfect success. The operation has been less often and less successfully resorted to in Great Britain than on the Continent and in America.

Since about 1870 various procedures have been introduced with a view to diminishing the risk to the mother when natural delivery is impossible. In Thomas's operation (1870) the skin incision is made in the groin, and the genital canal is opened into below the uterus, which is left intact. Porro's operation, first performed by him in 1876, consists in the removal of the uterus after the child has been delivered. Both these operations are improvements on the old procedure, in which the first incision was made in the middle line of the body. Suturing of the uterus and the use of antiseptics have greatly reduced mortality.

Cæsarion, or **PTOLEMY** (B.C. 47–30), son of Cleopatra and (it is supposed) of Julius Cæsar, was nominally joint ruler with his mother. After her death Augustus had him murdered.

Cæsium, an alkaline metal, almost always found along with rubidium, was discovered by Bunsen and Kirchhoff in 1860 by spectrum analysis. The metal, isolated for the first time in 1882, is silver white, soft and extensible, and like rubidium is highly analogous to potassium. Its symbol is Cs, and its atomic weight 132.9. Its melting-point is 26.5° C., and its specific gravity 1.88. It ignites spontaneously in the air, and when thrown on water behaves like sodium, potassium, and rubidium. The name is derived from *cæsius*, 'sky-coloured,' from the colour given to the blowpipe flame by cæsium. See **RUBIDIUM**.

Cæsura, in prosody, is a pause in the line, on whose varying position much of the rhythmical effect of verse depends; in classical prosody cæsura is the division of a word between two feet.

Café. See **COFFEE-HOUSES**.

Caffeine, or **THEINE**, $C_8H_{10}N_4O_2 \cdot H_2O$, is the alkaloid or active principle of Coffee (q.v.) and Tea (q.v.). When isolated, it forms beautiful white crystals, with a silky lustre, which are soluble in chloroform, water, alcohol, and ether. It is a remarkable fact that nearly all the beverages in use in different parts of the world owe their virtues to, or at least contain, the same or similar active principles. Thus caffeine is present in coffee, tea, guarana, Paraguay tea or *maté*, and in the kola nut; while in cocoa theobromine is the corresponding principle, differing but slightly from caffeine in chemical composition—the latter being methyl-theobromine—i.e. theobromine in which one atom of hydrogen has been replaced by the group methyl, CH_3 . In coffee, caffeine is present to the extent of from 1 to 2 per cent., while ordinary tea and guarana contain from 2½ to 6 per cent. In large doses, caffeine proves fatal to the lower animals, causing convulsions and death. In man, doses of 8 to 12 grains produce diuresis, great excitement, anxiety, and even delirium; but it has been of late used medicinally as a stimulant of the heart and nerves. It may be extracted from coffee or tea by making a decoction in hot water, and adding acetate of lead, which causes a precipitate of caffeotannate of lead. When the latter is acted on by sulphuretted hydrogen, the lead is separated, and the caffeine left in solution. On evaporation of the liquid, and recrystallisation from alcohol, the caffeine separates in crystals.

Caffeine forms a series of salts, of which the

citrate has come largely into use. One grain given every hour is often found to give great relief in sick headaches.

Caffraria, or **KAFFRARIA**. See **KAFFIRS**.

Cage-birds. Birds have been kept from the earliest history of the world to the present time by savage as well as by civilised races, and the origin of caging and domesticating birds as pets is lost in antiquity. Alexander the Great kept a ring-necked parakeet in a golden cage of fabulous value; and these birds still bear the name of the famous Greek emperor. Steam and colonisation have led to the regular importation into Britain of many thousands of foreign cage-birds every year, and as many of these varieties breed freely in England, our native songsters are less sought after as pets except by the poorer class. Not that any of these brilliantly plumaged foreigners can compare in song with several of our more sober-coated little songsters—the British blackbird, the thrush, or the skylark. There is now a craze for foreign bird-breeding, and Australian and American parakeets nestle freely in large cages or garden aviaries, burrowing into logs of rotten wood, making no nests, and laying their eggs in the holes. They stand our winters well if supplied with abundance of suitable food—viz. canary, hemp, millet, and oats for aviaries; and canary only in cages, where want of exercise produces excessive fatness and egg-binding. Of the foreign cage-birds, the best songsters are the shama (*Copsychus macrura*, an Indian bird of the thrush family), bulbul, Virginian nightingale (of which the hen sings quite as well as the male bird), and the American mocking-bird. Amongst English soft-billed songsters the most desirable are the nightingale, blackcap, blackbird, thrush, lark, and starling; these all have to be fed on crushed hemp and bread-crumbs, with animal food in the shape of meat or insects—spiders being a wonderful ‘pick-me-up’ for these birds when out of health. Of the grain-eating British birds kept for their song, finches and goldfinches head the list; but the bullfinch is deservedly popular, for he is very handsome in his crimson breast and black velvet coat, and he is essentially of a knowing, jolly disposition, although his call-note is somewhat monotonous. He can easily be taught to whistle a tune if the lesson is begun before he is old enough to be in full song. Siskins and redpolls are the unfortunate birds which a certain class of people delight to chain to a bucket-board by means of a belt or brace, and doom to draw their water and food from wells beneath by means of miniature buckets. Goldfinches and finches are sometimes similarly treated, but happily this cruel practice—like the ‘blearing’ of birds’ eyes with a hot iron to make them sing better—is rightly discountenanced.

Broadly speaking, the ailments which afflict all cage-birds are in ninety-nine cases out of a hundred due to injudicious and excessive feeding, and it is far better to err on the side of short commons than to feed too high. As the sicknesses of the birds owe their origin to insufficient exercise and too much stimulating food, the safest and most universal medicine is a drop of castor-oil, put into the patient’s mouth with a camel-hair brush. Artificially heated rooms and the fumes of gas are very deleterious to bird-life, and glass conservatories, by reason of their varying heat, are unsuitable places either for aviaries or cages. To hang a bird in a window, or to place an aviary cage there, is gross cruelty, because a draught is even more injurious to birds than to human beings; and pets kept under such conditions are always in bad health and wheezy.

The best parrot for talking purposes is the double-fronted, yellow-faced Amazon (*Chrysotis ochra-*

cephala), which is much hardier than the African gray birds, of which latter species more than ninety-five per cent. die in the process of acclimatisation. There are two varieties of grays—small from the south coast, and a larger kind from the west of Africa; these latter are the best. The spring of the year is the proper season to buy a parrot, as the young birds are then imported, and there is the whole summer and autumn in which to harden them off. The cockatoo family are all crested, and in some varieties the crests are fan-shaped, and can be opened or closed at will. These birds make noisy cage-pets, being querulous and excitable, and they never make good talkers. Canary-seed is the best staple article of diet for all the parrot tribe, both large and small.

Cagliari (pronounced *Cal’yari*), the capital of Sardinia, at the head of a spacious bay, on the south coast of the island. By steamboat it is 34 hours from Leghorn, 27 from Naples, 22 from Palermo, and 17 from Tunis; whilst by rail it is 174 miles S. of Porto Torres. With a lagoon on either hand, it lies at the base and on the slopes of a steep hill, 300 feet high; its streets are mostly narrow and dirty. Its harbour, defended by forts, has been enlarged since 1882; and Cagliari has a university (1596; remodelled 1764), a castle (*circa* 1217), a cathedral (1312; modernised 1703), and a bronze statue (1860) of Charles Felix V. Population, 61,000. Cagliari occupies the site of the *Carales* of the Carthaginians, and has a Roman amphitheatre, measuring 95½ by 79 yards. From 19 A.D. till 1492 it was the seat of a great Jewish colony; otherwise it has shared the ups and downs of Sardinia, having been several times besieged or bombarded—in 1708 by the English under Admiral Lake.

Cagliari, **PAOLO**. See **VERONESE**.

Cagliostro, **COUNT ALESSANDRO DI**, an arch-impostor, who, in the latter half of the 18th century, travelled through Europe, and whose adventures afford considerable insight into the men and manners of his times. He was born at Palermo, of poor parentage, 8th June 1743, and his true name was Giuseppe Balsamo. Carlyle’s picture of him when a boy—‘brass-faced, vociferous, voracious’—is probably accurate, and already prophesies the bold and boisterous quack. When thirteen years old he ran away from school, and was afterwards sent to the monastery of Caltagirone. Here he became assistant to the apothecary, and picked up that scanty knowledge of chemistry and medicine which he afterwards turned to such profitable account. His conduct in the monastery was in keeping with his character, but finding it too contracted a sphere for the development of his ambitious genius, he left it, or was ejected, and for a time led ‘the loosest life’ in Palermo. In 1769 he found it advisable to leave his birthplace; and in company with the Greek sage Althotas, he is vaguely represented as travelling in parts of Greece, Egypt, and Asia. At Rome, ‘his swart, squat figure first becomes authentically visible in the Corso and Campo Vaccino. He lodges at the sign of the Sun in the Rotunda, and sells etchings there,’ very hard up at this time. At Rome, too, ‘the bull-necked forger’ contrived to marry a very pretty woman named Lorenza Feliciani, who became a skilful accomplice in his schemes, and captivated many admirers, while Cagliostro picked their pockets. He now made the tour of Italy with great success as a physician, philosopher, alchemist, freemason, necromancer. Next, he extended his victorious career through some parts of Germany, and especially carried on a lively business in his ‘elixir of immortal youth,’ which became very popular among the ladies. By its virtue the count assured them he had already attained his

150th year, while his young and charming wife often talked affectionately of her son as 'a commander in the Dutch navy.' Through Courland, they advanced triumphantly to the court of St Petersburg, where he seems to have made his first failure; for the Empress Catharine, aided by her Scots physician, Rogerson—a keen-witted native of Annandale, who sceptically examined his famous 'Spaginic food,' and pronounced it 'unfit for a dog'—penetrated his real character, and made him the subject of a comedy. Cagliostro soon found it convenient to vanish. We next find him at Warsaw, discoursing on his pet Egyptian masonry, medical philosophy, and the ignorance of doctors, but he has the misfortune to be unmasked by a certain Count M. This, however, had little effect on the stupid credulity of Cagliostro's dupes—belonging, it must be remembered, to the upper classes, who in that age were at once sensual, infidel, and superstitious—so that they persisted for a time 'in distending his pockets with ducats and diamonds,' which, however, his lavish dissipation soon scattered to the winds—for this prophet of a new physical and moral regeneration, and inventor of an 'invaluable pentagon for abolishing original sin,' was a desperate gambler. In 1780 he went to Strasburg; and soon afterwards we find him in Paris, still founding lodges of 'Egyptian freemasons,' holding nocturnal meetings for the evocation of spirits, and scandalously simulating the character and deeds of a philanthropist. From Paris he came over to England, where he was cordially received by the followers of Swedenborg. On his return to Paris (1785), he became distinguished at court, was intimate with the weak and credulous Cardinal Rohan, and played a prominent part in the affair of the Diamond Necklace (q.v.). This lodged him in the Bastille; but he cleared himself by a statement which gained credit, and, after being liberated, carried on his adventures once more in England, but feebly, the sunshine of success now obviously growing dim; in short, the count, in gloom and foreboding, disappeared from the island. On the Continent, too, the market was closed, a general distrust having been excited by the revelations of one of his dupes. 'At Aix, in Savoy, there are baths, but no gudgeons in them;' at Turin he is ordered off by the king; a similar fate befalls him at Roveredo; at Trent we catch a glimpse of him 'painting a new hieroglyphic screen,' which, however, attracts no more the gaping crowd; lower still, 'he pawns diamond buckles;' finally, his wayworn wife 'longs to be in Rome by her mother's hearth.' In May 1789 he entered the city; on the 20th December he was imprisoned by the Inquisition, and condemned to death for freemasonry. His sentence was commuted to imprisonment for life in the fortress of San Leone, where he died 26th August 1795. His *Mémoires* (Paris, 1785) are not authentic. See the essay (1833) in Carlyle's *Miscellanies*.

The above is the ordinarily received account, made familiar by Carlyle's *Miscellanies*. But it should be added the evidence for identifying Cagliostro with Balsamo is slender and some think quite insufficient; we do not certainly know the history of Cagliostro, who probably used hypnotic suggestion as well as pure charlatanism, till he appears under his own name in London in 1776. Nor is it proved that he died or was murdered in the 'dried-up cistern' or dungeon of San Leone in 1795; some believe that he escaped and lived some years in Russia. See Trowbridge's *Cagliostro* (1910).

Cagnola, LUIGI, MARQUIS (1762-1833), an architect, born at Milan. A follower of Palladio, he belonged to the revivers of classical architecture.

Cagots (Basque *Agotac*), a name given to a distinct tribe of people, who are found scattered in the district of the western Pyrenees. Formerly

they were usually said to be the descendants of the Visigoths, who remained in France after their defeat by Clovis in the 5th century, and the name was explained as a corruption of *canis gothus* ('Gothic dog'). But it is difficult to understand why such a descent should have maintained its opprobrium. Others have connected them with the Albigenses, or the Moors left behind in Gascony after the disaster at Tours; it is far more likely that they were originally the victims of social seclusion due to the taint of leprosy, but that the disease wore itself out from their healthy way of life. M. de Rochas has strengthened this argument by showing how easily *Caqueraz*, the ordinary name applied to the same or a similar people in Brittany, is formed from the Celto-Breton word *cacodd*, 'leprous.' Until the French Revolution they were forced to wear a peculiar dress, were forbidden to practise all but the most menial trades, though M. P. Raymond has shown that in the 14th and 15th centuries some were even bankers and physicians, and were obliged to live isolated, either in separate villages or in separate quarters of the towns. So complete was their estrangement from the other inhabitants, that they were forced to enter the churches by doors specially set apart for them. Since that Revolution, they have been placed, as regards the law, on an equal footing with other citizens, but socially they are still regarded as a degraded race. In their language there is nothing that is distinctive, save that their isolation has sometimes made them speak a purer dialect than their neighbours, nor yet are they ethnologically distinct; although many have claimed that the predominant blue eyes, fair hair, and fair complexion point back to a Teutonic origin. They have been often connected erroneously with the *Cretins*, with whom their healthy frames, and strong but not unhandsome figures, have little in common. Races, whose history and present condition greatly resemble those of the Cagots of south-western France, are called *Caqueraz* in Brittany, and *Coliberts* in Poitou, Maine, and Anjou. See Michel, *Histoire des Races Maudites de la France et de l'Espagne* (2 vols. 1847); the bulletins of the *Société Anthropologique* (1871, &c.); Rochas, *Les Parias de France et d'Espagne, Cagots et Bohémiens* (1877); and Dr J. Hack Tuke in vol. ix. (1880) of the *Journal of the Anthropological Institute*.

Cahir, a town in County Tipperary, Ireland, beautifully situated on the Suir, 11 miles NW. of Clonmel. On a rock in the river is Cahir Castle, built in the 12th century. The town has a large trade in corn and flour. Pop. 2000.

Cahors (anciently *Divona*), the chief town in the department of Lot, in the south of France, is situated on a small rocky peninsula, formed by a bend of the river Lot, 71 miles north of Toulouse by rail. The streets are steep and narrow, and present many fine specimens of antique architecture. The cathedral was built early in the 12th century. Cahors contains many Roman remains, including those of a magnificent aqueduct. The famous Fénelon was a student at the university here, which was founded by Pope John XXII. in 1321, but united with that of Toulouse in 1751; and here were born the poet Clément Marot, and Léon Gambetta to whom a monument was raised in 1884. The town was taken and pillaged by Henry of Navarre in 1580. Its industries are pottery and tanning; it has also an active trade in truffles, oil, wine (a dark-red Pontac), walnuts, plums, wool, and lime. Pop. 13,000.

Caicos, a group of islands belonging geographically to the Bahamas, but annexed in 1874 to Jamaica. The North, West, East, Grand, and

other Caicos have, together with Turks Islands, an area of 165 sq. m., and a population of 5600. Salt, conchs, sisal, sponges are their chief products.

Caifa. See HAIFA.

Caillaud, FRÉDÉRIC, a French traveller, born at Nantes, 9th June 1787, became a goldsmith and travelled over Europe, and in 1815 to Alexandria. In examining the mineral resources of Egypt, he rediscovered the ancient emerald mines of Jebel Zobara, near the Red Sea; and his report of a journey to Siwah (see OASES) led to its annexation by Egypt in 1820. In 1821-22 he accompanied Ibrahim Pasha's expedition to the White Nile, and his *Voyage à Meroé* (4 vols. Paris, 1823-26) contained the first reliable information of that district. In 1827 he settled as conservator of the Natural History Museum at Nantes, where he died, 1st May 1869. He published a *Voyage à Syouah* and two volumes of researches on the life of the ancient Egyptians, Nubians, and Ethiopians.

Caillié, RENÉ or AUGUSTE, a French traveller, noted for his journey to Timbuktu, was born 19th September 1799 at Mauzé, in Poitou. Having gone to Senegal, and engaged in trading with the natives, he learned about 1826 that the Geographical Society of Paris had offered a premium of 10,000 francs to the first traveller who should reach Timbuktu. Provided with a stock of goods for barter, and dressed in Moorish garb, Caillié, who had learned Arabic, started from Kakondy in Sierra Leone, April 18, 1827, and after some delay caused by illness, reached the mysterious city, April 20, 1828. Here he remained fourteen days, then accompanied a caravan across the Sahara Desert, reaching the coast at Tangier, August 7. After hearing and examining his statements, the society awarded him the offered prize, with a pension of 1000 francs. His notes of travel, arranged by M. Jomard, were published under the title *Journal d'un Voyage à Tombouctou*, &c. (3 vols. 1830). Caillié died near Paris, May 7, 1839.

Cain, the first-born of Adam and Eve, appears in the book of Genesis as the prototype of human weakness descending swiftly into inhuman wickedness, and Cain and his family are contrasted with the husbandman Abel as the founders of settled life and worldly culture. A sect of the Ophite Gnostics, called *Comites* (130 A.D.), believed that Cain was the offspring of the intercourse of a superior Power with Eve, and Abel of an inferior Power; that their characters corresponded to their paternal parentage, and that the slaying of Abel only symbolised the victory of the superior over the inferior Power. See Gnosticism, OPHITES.

Caine, SIR THOMAS HENRY HALL, was born (of Manx blood on his father's side) at Run-corn in Cheshire, on the 14th May 1853, and was trained as an architect, but gradually passed to journalism (on the *Liverpool Mercury*) and literature. He published *Recollections of his friend Rossetti* (1882), *Sonnets of Three Centuries* (1882), and *Cowboys of Criticism* (1883); but is best known by his novels, *The Shadow of a Crime* (1885), *A Son of Hagar* (1886), *The Deemster* (1887), *The Bondman* (1890), *The Scapegoat* (a story of Morocco, where he travelled, 1891), *The Manxman* (1894), *The Christian* (1898), *The Eternal City* (1901), *The Prodigal Son* (1904), *The White Prophet* (1909), *The Woman Thou Gavest Me* (1913), *The Master of Man* (1921). Some have been dramatised—*The Deemster* as *Ben-my-Chree* (1889). Of his plays, *Mahomet* was withheld from the stage at the Turkish ambassador's request. He promoted the international copyright movement.

Ca'ing Whale. See CAAING WHALE.

Cainozoic. See TERTIARY, GEOLOGY.

Ça ira ('It will go on!'), a popular song which arose in the fever of the French Revolution, so named from its refrain:

Ah! ça ira, ça ira, ça ira!
Les aristocrates à la lanterne!

Like the *Marseillaise*, the *Carmagnole*, and the *Chant du Départ*, it became a French national song, and was styled the *Carillon National*. The words, which are worthless rubbish enough, were due to a street singer named Ladré; the melody to Bécourt, a stage-drummer. The song was prohibited by the Directory in 1797.

Caird, SIR JAMES, born at Stranraer, in Wig-townshire, in 1816, published in 1849 a treatise on *High Farming as the Best Substitute for Protection*, and among later works, *English Agriculture in 1850-51* (1852), a reprint of letters to the *Times*, which has been translated into German, French, and Swedish, and republished in the United States. He sat in parliament as a Liberal, 1857-65, and in 1864 obtained a grant for the collection and publication of agricultural statistics of the country. Appointed chairman of the Royal Commission on Sea Fisheries in 1863, he was made a K.C.B. in 1882. He died 9th February 1892.

Caird, JOHN, a great Scottish preacher, was born at Greenock in 1820. He studied at the university of Glasgow, and held in succession pastoral charges at Newton-upon-Ayr (1845), Lady Yester's parish, Edinburgh (1847), Errol, in Perthshire (1849), and Park Church, Glasgow (1857). A sermon preached before the Queen at Crathie in 1855, and published under the title of *Religion in Common Life*, quickly carried the fame of the author into all parts of the Protestant world. Dean Stanley said it was the greatest single sermon of the century. In 1858 Caird published a volume of sermons, marked by beauty of language, strong thought, and intense sympathy with the spiritual aspirations of mankind. He received the degree of D.D. in 1860, was appointed professor of Divinity in 1862, and in 1873 Principal of Glasgow University. In 1880 he published a (Neo-Hegelian) *Introduction to the Philosophy of Religion*, and in 1888 a small work on Spinoza. He died 30th July 1898.—His brother, EDWARD, born 22d March 1835, from Glasgow passed as a Snell exhibitioner to Balliol College, Oxford, and became in 1864 fellow and tutor at Merton. In 1866 he was appointed professor of Moral Philosophy at Glasgow University, where he exercised unusual personal influence over his students; and from 1893 till his resignation in 1907 he was Master of Balliol. Among his works are a *Critical Account of the Philosophy of Kant* (1877), an excellent little book on Hegel, an examination of *The Social Philosophy and Religion of Comte* (1885), and the St Andrews Gifford Lectures on *The Evolution of Religion* (1893). He died in 1908. See Jones and Muirhead, *Life and Philosophy*.

Cairn, or CARN, a Celtic word signifying a protuberance, a heap, a pile, appears in names of hills and rocks in Scotland, Ireland, Wales, Cornwall, and Brittany; but in archæology, 'cairns' are artificial heaps of unhewn stones. Externally all cairns are very much alike, the only differences discernible being those of size and basal outline. Internally they vary in their construction according to their purpose and period. Prehistoric cairns are usually sepulchral, but any dry-built structure, such as a broch, a bee-hive house, or even an early Christian church in a condition of ruin, may assume the appearance of a cairn. Sepulchral cairns of the prehistoric period are divisible into two classes—chambered and unchambered—the former being characteristic of the stone age, the latter of the age of bronze and later times. The chambered cairn may be circular,

oval, or oblong on the ground-plan, sometimes with concave or convex ends. The passage, roofed with flat stones, leads into a chamber which may either have a roof of Bee-hive (q.v.) construction as in the British Isles, or of megalithic construction of immense blocks laid from wall to wall as in Brittany and Scandinavia. The chamber is sometimes subdivided by partitions of slabs set on edge in the floor, at other times there are smaller chambers opening off three sides of the main chamber, the fourth side being occupied by the entrance-passage, as at Maeshowe in Orkney. Both burnt and unburnt human remains are found in these chambered cairns, which seem to have been family sepulchres used for long periods consecutively. They are often of great size, and conspicuously placed on eminences, or associated in groups as tribal cemeteries like those of Tailten, Cruachan, and Brugh, so often referred to in the early Irish annals as 'the three cemeteries of the idolaters.' The external configuration of the cairn is usually defined by a single or double retaining wall, and the site is sometimes surrounded by a ditch, or by a ditch and rampart of earth, as at Maeshowe; or by a single or double circle of standing stones, as at Clava in Strathnairn; or it may be associated with an alignment, or group of standing stones arranged in rows, as at Callernish in the island of Lewis. The chamber is always small in comparison with the vast size of the cairn itself. In Caithness an oblong cairn 240 feet in length had a chamber measuring only 12 feet by 6. Maeshowe (a circular cairn covered with earth), 92 feet in diameter and 36 feet in height, has a chamber measuring only 15 feet by 14 feet 10 inches, entered through a passage 54 feet in length. Gavr Innis in the Morbihan, 197 feet in diameter and 30 feet high, has a chamber measuring only 9 feet by 8, entered through a passage 44 feet in length. In this case both passage and chamber are lined with great stones elaborately sculptured with groups or patterns of irregularly circular, spiral, and wavy lines. In a cemetery of about 30 cairns at Loughcrew, in Ireland, there are several of 120 to 180 feet in diameter, the chambers of which are lined with sculptured slabs of somewhat similar character. The great chambered cairn of New Grange, one of a group of three situated on the banks of the Boyne, near Drogheda, with a diameter of 315 feet and a height of about 70 feet, has a chamber of about 13 feet diameter, with side recesses of smaller size. The passage is 63 feet in length, and many of the great stones lining the passage and chamber are sculptured with incised patterns of irregular spirals and zigzags. The site of the cairn is surrounded by a circle of standing stones. It is on record that these cairns were opened and plundered by the Norsemen in 862 A.D. The unchambered cairns of the bronze age and later times are usually smaller in size and mostly circular. Instead of a passage and chamber they contain in their interior, sometimes on, sometimes under the surface level, one or more burials, burnt or unburnt, inclosed in cists formed of unhewn flat slabs. There is in the church of Penmachno, in Wales, an early Christian monument which states that 'Carausius lies here, in this cairn of stones,' 'Carausius hic jacit in hoc congeries lapidum' (sic). Adamnan in his life of St Columba mentions that a converted chief in Skye was buried by his followers under a cairn. There is an old Gaelic proverb, *Cuiridh mi clach 'ad charn*, 'I will add a stone to your cairn,' and in the north-west Highlands it was the custom to erect cairns of stones at the halting-places on the journey to the cemetery. Cairns, apart from their original purpose, have been used as boundaries, or as the meeting-places of tribes, or the inauguration-places

of chiefs. The *Cairn-na-cuimhne*, near Balmoral, was the mustering-place of the men of Strathdee. Occasionally a cairn may be raised to commemorate some event, or to mark a spot traditionally connected with a deed of fame or of horror. A familiar instance of the latter class is found in Mushet's Cairn in the King's Park, Edinburgh, where a wife was murdered by her husband in 1720 (see Scott's *Heart of Midlothian*); to the former belong the Jubilee cairn on Ben Ledi, and the numerous cairns round Balmoral. Cairns are most frequent in stony countries. Where stones are scarce, the earthen mound or Barrow (q.v.) came in place of the cairn, from which it differs only in the materials. See CALLERNISH, MAESHOWE.

Cairnes, JOHN ELLIOT, economist, was born in County Louth, Ireland, 26th December 1823. His father was a brewer, and as the son showed no aptitude for such learning as his teachers offered him, he was placed in the brewery. After a time, however, young Cairnes began to entertain a liking for intellectual pursuits, and, much against his father's will, went to Trinity College, Dublin, where he graduated B.A. in 1848. In 1856 he was appointed Whately professor of Political Economy at Dublin, the first-fruits of this office being his *Character and Logical Method of Political Economy* (1857). In 1859 he was elected to the chair of Political Economy and Jurisprudence in Queen's College, Galway. He published in 1862 his book on the *Slave Power*, which made a profound impression. In 1866 he was called to the chair of Political Economy in University College, London. He published his *Essays on Political Economy, Theoretical and Applied* in 1873, and in 1874 *Some Leading Principles of Political Economy newly Expounded*. An accident in the hunting-field in 1860 led to a breakdown in health, from which he never quite recovered, and the later years of his life were clouded with suffering, which he bore with patience, nor did it prevent him taking a lively interest in the affairs of the day. He died 8th July 1875. As an economist, Cairnes may be regarded as a disciple of Mill, but his adhesion was that of a powerful and independent thinker, whose opinions were the result of his own research. He elucidated with great clearness, grasp, and philosophic comprehensiveness many of the most important and difficult problems in political economy. He maintained the doctrine of the 'Wages Fund' after Mill had himself abandoned it.

Cairngorm, or more fully CAIRNGORM STONE, a name often given by jewellers, particularly in Scotland, to brown or yellow quartz or rock-crystal, because found among the Cairngorm Mountains, in south-west Aberdeenshire. The same mineral is found in many other localities, as at Olivet near Orleans, in Bohemia, Brazil, Siberia, &c. In Cairngorm and the neighbouring district of Mar, it occurs both in the granite rock and in the alluvial soil. It differs from common colourless quartz or rock-crystal only in the presence of a very little oxide of iron or manganese, to which it owes its colour. It is much used as an ornamental stone. The yellow variety is not unfrequently called topaz, although quite different from the true topaz, which it resembles chiefly in colour, having neither its hardness nor its brilliancy. The topaz is, however, sometimes found along with it in the granite and gneiss districts of Mar and Cairngorm. The brown variety is sometimes called Smoky Quartz, and when of a good and uniform colour is by some preferred to the yellow.

Cairngorms, a Scottish mountain group on the borders of the counties of Inverness, Banff, and Aberdeen, and of the basins of the Spey, Don, and

Dee, includes the highest summits (except Ben Nevis) in the British Islands—Ben Macdhui (4290 feet), Braeriach (4248), Cairntoul (4241), and Cairngorm (4084).

Cairns, on Trinity Bay, in northern Queensland, the port of the Atherton and Evelyn (timber and agriculture), Herberton (tin-mining), Irvinebank (tin), and Chillagoe and Etheridge (gold, silver-lead, and copper) districts, promised to become the most productive area in Queensland. The district produces sugar. At Kameelunga, 9 miles away, is the State experimental farm for tropical and semi-tropical products. Pop. 7500.

Cairns, EARL HUGH MACCALMONT CAIRNS, a great lawyer and parliamentary debater, was born in County Down, Ireland, in 1819, and educated at Trinity College, Dublin. He was called to the bar at the Middle Temple in 1844, was returned to parliament for Belfast in 1852, and quickly made his mark in the House by his fluency and readiness in debate. He became Q. C. in 1856, in 1858 Solicitor-general, and in 1866 Attorney-general under Lord Derby. Later in the same year he was made a judge of appeal, and in 1867 was created Baron Cairns. Under Disraeli's premiership he became Lord Chancellor in 1868, and again in 1874, and was created Earl Cairns in 1878. For some years he led the Conservatives in the House of Lords, and was a zealous philanthropist. He died 2d April 1885.

***Cairns**, JOHN (1818-92), born at Ayton Law, Berwickshire, studied at Edinburgh, was minister at Berwick in 1845-76, and was professor of theology and principal of the United Presbyterian seminary. He wrote on philosophy and theology, and a memoir of Dr John Brown. See *Life* by Macewen (1895).

Cairo, the capital of modern Egypt, lies on the right bank of the Nile, near the apex of the Delta, in N. lat. 30° 3', E. long. 30° 21', by rail 129 miles south of Alexandria, and 48 miles west of Ismailia on the Suez Canal. It is the largest and most populous city in Africa. In 1882 its population was 374,838, in 1907, 654,476 (including the suburbs and Helwân), and in 1917, 790,939; whilst the European element, consisting largely of Italians, Greeks, and Levantines, rose from about 21,000 in 1882 to 46,507 in 1907. The majority of the inhabitants are of mixed Arab and Egyptian race; but there are large numbers of Copts, Turks, Syrians, Armenians, Jews, and negroes. The principal growth of the city during the past century has been to the west, covering what was the bed of the Nile up to the 13th century; and the contrast between the historical and the almost European parts is sharply drawn by a line running north and south, a little to the east of the Ezbekiya Square. Suburbs have arisen on the north-east ('Abbasia, now chiefly military), and are in process of extending far afield, as at Heliopolis. The medieval city, however, stands characteristic and apart, and the various stages of its expansion can still be traced. It is built upon the vestiges of four distinct foundations. Before the Arab conquest, in 641, there was a town (perhaps a notherly suburb of Memphis) known as Babylon, and here was a Roman fortress (now called Kasr-esh-Shema', and notable for its mixed contents, which include five Coptic churches, two Greek, and a Jewish synagogue). On its submission, 'Amr, the Mohammedan general, began to build a town for his Arab army on the site of his camp, close to the fortress, and in this military settlement, which was named El-Fustât (a word which Arabic lexicons interpret by 'tent,' but which may be a corruption of *fossatum*, an 'earth-work'), he built his mosque, still standing, though frequently altered and enlarged. What is popularly called 'Old Cairo,' properly Misr-el-'Atika,

stands partly on the site of Fustât, the rest of which lies buried under sand-drifts. When the 'Abbâsid khalifs supplanted the Omayyads in 751, an official suburb, El-'Askai ('the Camp'), sprang up round the new governor's residence, to the north-east of Fustât; and in 870 Ahmad-ibn-Tûlûn, the first virtually independent Mohammedan ruler of Egypt, shifted the seat of government another step north-east, by founding El-Katâi ('the Fiefs') for his battalions, whose quarters were ranged round about his splendid new palace and his famous mosque, which still stands, in great decrepitude, as evidence of the early use of the pointed arch in so-called Arab architecture. Yet another extension to the north-east took place in 969, when Gôhar, the general who conquered Egypt for the Fâtimid (Shi'a) khalifs of Tunis, laid the foundations of the great palace-enclosure which he named El-Kâhira ('the Victorious'), whence the Italian form Cairo. In the present day the whole city is commonly called Masr, or Masr-el-Kâhira (Masr, correctly Misr, is also the Arabic name of Egypt itself), though Masr originally meant that part of the city which was not included in the Fâtimid royal faubourg. El-Kâhira, however, gradually joined on to the older quarters, and the various separate towns or suburbs grew into one city. The Fâtimid walls, still visible in places, or traced by the names of gates, such as Bâb Zuweyla in the heart of Cairo, were greatly extended by Saladin so as to include his Citadel, which was founded in 1176 on a spur of the Mukattam hills, to the east of Ibn-Tûlûn's old quarter; and Saladin's wall still forms the eastern limit of Cairo.

The majority of the buildings, however, which form the characteristic features of the medieval city belong to the period of the Mamelukes (Mamlûks) and the Turks who succeeded them. It may still be seen in much of its former picturesqueness in the space extending roughly between the Bâben-Nasr ('Gate of Victory') and the Citadel, including most of the old Fâtimid faubourg. Here are still the narrow, crowded, winding streets; the cupboard-like shops; the great enclosed *kham*s or warehouse-markets; the streets or quarters, occupied each by a distinct trade (or nationality), and formerly shut off by great gates, of which few remain; the skeletons of huge palaces and mansions of the later Mamelukes; the quiet, residential lanes, with upper stories overhanging, and sometimes still furnished with the lattice-windows termed *meshrebtyas*; the decorative street-fountains and ornate and tiled school-houses; and, above all, the splendid series of mosques, in which the development of Saracenic architecture may be traced in its purest expression from the 10th to the 16th century. From the mosque of El-Hâkim (990), which stands beside the Gate of Victory, to that of El-Ghôri (1503), and between these dates, those of Kala'ûn (1288), his son En-Nâsir (1298), Sultân Hasan (1358), in front of the Citadel, the history of a rare and vanished art is revealed. Neglect and vandalism, natural decay, and the greed of the travelling collector have irrevocably injured the sacred and secular monuments of Cairene art; but since 1882 the Committee for the Preservation of the Monuments of Arab Art, aided by government grants, has worked hard to save what remained, and has not only maintained in more or less stable condition the great majority of the monuments which it found menaced with destruction, but has spent many thousands of pounds in restoring a few typical mosques to their original state, as far as this can be reproduced by the highly skilled staff of the committee. The protection of ancient buildings has become highly efficient. The Museum of Arab Art in its new building, opened in 1903, with a library (containing a fine collection of Arabic

MSS.), testifies to the interest now taken in the art of the Saracens.

Cairo has passed through many political phases. From 641 to 969 it was a provincial capital under the Eastern khalifate, with intervals of virtual independence. From 969 to 1174 it was the capital of the Shi'a Fātimid khalifs. It was the seat of an orthodox Moslem kingdom from Saladin's time to the fall of the Mamlūk sultans in 1517. After that it relapsed into the provincialism of a pashalik. In 1798 the French occupied it, to be evicted by the English in 1801. In 1811 Mohammed 'Alī Pasha once more restored it to practical independence. From 1882 it was protected by a British army. In 1922 it became capital of a kingdom.

The invasion of medieval Cairo by western ugliness is seen chiefly in the Shāri' Mohammed 'Alī, a broad, straight street, lined by shops and offices, connecting the Citadel with the modern part of the city, and by the electric tramways which run in the broader thoroughfares and have utilised the bed of the old canal (El-Khalīf), filled up in 1897. But for the most part the European Cairo is distinct from the Oriental, and occupies ground to the west of it. Here, round the Ezbekiyya, and between it and the Nile, are the chief hotels (which are thronged by Western visitors in the winter and spring), the government offices, opera-house, post-office, banks, churches, consulates, international law-courts, and the large residential quarters of Ismailiyya and Tewfikiyya, consisting of modern villas of the Italian kind, usually let in flats, and standing in gardens, ranged along broad avenues planted with trees. A little farther south is 'Abdīn, the principal palace of the king, where official receptions are held. Other palaces stand on the bank of the Nile, where are also the chief hospitals, barracks, and the Egyptian Museum, originally housed at Būlāq, removed to a palace at Gezira in 1889, and brought back to its handsome building near the great bridge of Kasr-en-Nil in 1902.

Beyond Būlāq (q.v.), the Nile-port of Cairo, which rose out of the river's bed only in the 14th century, is the island of Gezira, formed about the same time, which has been converted into the playground of Cairo. There are a large hotel (once a khedivial palace), polo-ground, race-course, tennis-courts, and all the apparatus of a gymkhana. A little farther south is the ancient island of Er-Rōda, with remains of a medieval mosque and palace, but chiefly celebrated for its 9th-century Nilometer, a square well for measuring the rise of the river in days before scientific damming. Helwān, 14 miles south of Cairo, in the desert (opposite the site of Memphis), connected by rail, may be regarded almost as a suburb; its hotels and villas attract numerous visitors and patients, who benefit by its sulphur springs and pure desert air.

In the essentials, and also the luxuries, of modern life Cairo is well supplied. The Egyptian schools have made considerable progress; there are various higher, technical, and scientific colleges; and a movement is on foot to supplement the old system of the Azhar, the medieval (970) university mosque, by a 'national' university. The Azhar itself is a most interesting survival of obsolete Moslem scholasticism. In 1901 there were 251 'professors' and 10,403 students, and in 1914, 405 teachers and 9749 students, more than all the undergraduates of Oxford and Cambridge combined. Commercially there is not much doing in Cairo except in the import and transport trade; for the old arts and industries of Egypt have dwindled or vanished. Rude pottery, turned woodwork, silver-smiths' work, silk, leather, and paper-making are the chief remaining manufactures. The great influx of Europeans has improved the shops, and of course implies a large custom. Rail and tele-

graph connect the capital with Alexandria, Port Saïd, Ismailia, Suez, and the Sudan.

See Stanley Lane-Poole, *Cairo* (Medieval Towns; 1902); E. W. Lane, *Cairo Fifty Years Ago* (1896); E. A. Reynolds-Ball, *Cairo* (1898); Ravaisse, *Topographie du Caire* (1887); Makrizi, *Topographie* (French trans. by Bouriant, in progress).

Cairo, capital of Alexander county, Illinois, on a low point of land at the junction of the Ohio with the Mississippi, about 180 miles below St Louis, is an important centre of railway and steamboat traffic. A steel bridge (1888) connects the railways north and south of the Ohio. The city has suffered much from inundations, from which it is now protected by levées, utilised for streets and railway tracks. Some of these burst in 1912. There are numerous factories, a convent, an academy, a United States marine hospital, and a custom-house. Pop. 15,000.

Caisson, in engineering construction, is a chest used in 'laying' the foundations of the piers of bridges, quays, and like structures, in deep and rapid rivers. It consists of a very strong platform of timber or of metal plates, to which the sides are attached. The site of the pier being levelled by dredging or otherwise, the caisson is brought over the spot, and moored in the proper position. Two or three of the lower courses of masonry are then built upon the platform of the caisson, and the water is slowly admitted by a sluice, in order to cause the caisson to settle into its place.

When the foundations are laid with concrete, the caisson may consist of a simple frame of wooden walls, floated into position to form an enclosure, into which the concrete can be shot, and can set undisturbed by the wash of the water. Compressed air is now very generally employed inside a metal column, in a chamber at the bottom of the column, where workmen are required for excavating. The column is open at the bottom, and the water is prevented from occupying the working chamber by the counterpressure of the air. Communication between the working chamber and the external atmosphere above is effected by means of what is aptly called an 'Air-lock' (q.v.), serving for the exit and entrance of the workmen and materials. The air in the lock is lowered to the pressure of the atmosphere before the chamber is opened for the passage of men or materials to the open air; and it is, on the contrary, raised to the pressure of the air in the working chamber before men and materials are admitted.

In excavating for the foundations of the Forth Bridge, the caissons were of very large dimensions, being 70 feet in diameter, the greatest depth reached varying from 71 feet to 89 feet below high-water, and from 39 feet to 43 feet into the bed of the Forth. The pneumatic process was in the main adopted (see BRIDGE).

The second and more substantial Tay viaduct (see DUNDEE) has main spans of 245 feet, each pier carrying which is formed of two iron cylinders, 23 feet in diameter, filled with brickwork and concrete, and sunk to depths varying from 20 feet to 30 feet into and resting upon sand, the depth of water at high-tide being 23 feet. The weight borne by each superficial foot in the cylinders is estimated at 3 tons.

The bridge over the Ganges at Benares, with spans of 335 feet, has piers composed of single iron caissons of oval shape, 65 feet long, 28 feet broad, lined with brickwork and filled with concrete. They are sunk to a depth of about 100 feet.

One of the most remarkable instances of the sinking of foundations by means of iron caissons was exhibited in the erection of a graving-dock at Toulon. Here the caisson was 472 feet long by 134 feet wide, and 62 feet deep. It embraced the

entire dock, which was built of masonry. The excavation was performed by the use of a compressed-air chamber in the bottom of the caisson, as in the Forth Bridge.

Caisson, in relation to shipping, is an apparatus for lifting a vessel out of the water for repairs or inspection. It is usually a hollow structure, sunk by letting water into it. There is an air-chamber inside, which allows it to sink only to a certain depth. In that state it is hauled under the ship's bottom, the traps or openings are closed, the water is pumped out, and the caisson rises with the ship upon it. *Pontoon* is another term for the same apparatus.—The name caisson is also given to the pontoon or floating gate used to close a dry-dock or similar place.

Caithness, a county in the extreme N. of the Scottish mainland. Its length from NE. to SW. is 43 miles; its greatest breadth, 28 miles; and its area, 700 sq. m. Except in the west and south, where the mountain-range dividing Caithness from Sutherland attains in Morven a height of 2313 feet, the general aspect of Caithness is level and bare, being in great part moorland and treeless. The northern sea-coast is bold and rocky, with many bays, inlets, promontories, and caves. Here are Dunnet Head and Duncansbay Head; and on the west side of the last-named is John o' Groat's House (q.v.). There are no navigable rivers in Caithness, and no lakes of importance. The climate is damp and chilly, but snow rarely lies on the plains above a day or two at a time. Thunder is rare; auroras are seen almost nightly in winter. The common fuel is peat. The chief crops are oats, bere, turnips, and potatoes; but only a fourth of the area is in cultivation. The parts which are under tillage have generally a deep fertile loam on a strong till clay. In the north-east the soil is sandy. The crops are twenty days later in ripening than in the Lothians. The occupants of many of the small farms divide their time between farming and fishing. There are herring, ling, cod, salmon, and lobster fisheries. The herring-fishery falls in July and August, and Wick is a chief seat of the British herring-fishery. The other exports are cattle, oats, wool, and flagstones. The county, with Sutherland, returns one member to parliament. Till 1918 Wick was a parliamentary burgh; Thurso is a police burgh, an old burgh of barony. Pop. (1801) 22,609; (1861) 41,111; (1881) 38,865; (1911) 32,010; (1921) 28,284. In early times Caithness is supposed to have been inhabited by Celts, who afterwards mixed with Danes and Norwegians; and from the 10th century to 1196 it was subject to Scandinavian jarls. The Scandinavian origin or part-origin of the people of Caithness is shown by their tall forms and fair features, and their speaking English instead of Gaelic. Caithness has remains of brochs and several old castles. See Laing's *Prehistoric Remains* (1866), Calder's *History* (new ed. 1887), and the Ancient Monuments Commission's *Report* (1912).

CAITHNESS FLAGSTONES are thin-bedded, dark-coloured bituminous sandstones, slightly micaceous and calcareous, valuable on account of their great toughness and durability for pavements, cisterns, and various other purposes, and accordingly are largely exported. They belong to the Old Red Sandstone (q.v.), and contain abundant remains of fossil fishes.

Caius, DR JOHN, physician and scholar, was born at Norwich in 1510. (Caius, pronounced *Keys*, is a Latinised form of the English name Kayes or Keys.) He entered Gonville Hall, Cambridge, in 1529, and in 1533 was elected a fellow thereof, having just before been appointed principal of Fiswick's Hostel. In 1539 he went abroad, in 1541 was created an M.D. of Padua; returning

to England in 1544, he delivered lectures on anatomy in London, then practised at Shrewsbury and Norwich. In 1547 he was admitted a fellow of the College of Physicians, of which he was subsequently nine times elected president. He also became physician to Edward VI., Queen Mary, and Queen Elizabeth. In 1557 he obtained permission to elevate Gonville Hall into a college, which took the name of Gonville and Caius College, and of which in 1559 he became master. A loyal Catholic, he had great trouble with his Protestant fellows, who burned his mass vestments, and whom in return he put in the stocks. He died 29th July 1573. He was author of *A Booke or Counsell against the Sweatyng Sicknesse* (1552), and of other works (collected, with life, in 1912) on subjects critical, antiquarian, and scientific.

Caivano, a town of Italy, 4 miles N. of Naples, manufactures glass and casks; pop. over 12,000.

Cajamarca, a department in the NW. of Peru, between the western chain of the Andes and the Amazon. A railway connects it with the Pacific, and there is a large farming and cattle-raising industry. Area, 12,500 sq. m.; pop. about 450,000. The capital is Cajamarca; pop. 12,000.

Cajeput, or CAJUPUT (*Melaleuca leucodendron* or *minor*), a tree of the order Myrtaceæ, from the leaves of which the pungent, aromatic, volatile oil called Oil of Cajeput is obtained by distillation. It ranges from Australia to the Philippines and the Malay Peninsula. It is rather a small tree, with a crooked trunk, thick spongy bark, white wood, elliptical-lanceolate alternate evergreen leaves, and terminal spikes of white flowers. The greater number of the species are natives of Australia, some of them very beautiful shrubs and frequent in hothouses. The tree is known in Australia as Swamp Tea-tree or Paper Bark, the name 'cajeput' being given only to the oil.

Cajetan, CARDINAL, properly Thomas de Vio, was born at Gaeta in 1469. At an early age he entered the Dominican order, lectured on theology at Brescia and Pavia, and became general of his order in 1508, cardinal in 1517, Bishop of Gaeta in 1519, and legate to Hungary in 1523. In the history of the Reformation, his name is remembered for his vain attempt to induce Luther to recant his errors at Augsburg in 1518. He was prepared to make concessions to the Reformers. Cajetan died at Rome in 1534. His *Opera Omnia* were printed in 5 vols. at Lyons in 1639.

Calabar, or OLD CALABAR, is a coast district of Upper Guinea, constituting the south-eastern province of Nigeia (q.v.), extending from the Nun mouth of the Niger eastwards. The principal river is the Cross River, which, navigable for about 200 miles, unites with the Old Calabar River and two smaller rivers to form the Old Calabar estuary. The chief towns are Old Calabar (Duke Town), seat of government of the protectorate, on the estuary, about 40 miles from the sea; Creek Town; and Fish Town. Palm oil and kernels, rubber, various woods and gums, ivory, and hides are the chief products, and nurseries for supplying rubber seedlings have been established. Missionary enterprise has been very active, and there has been a Presbyterian mission since 1846. The Efik is the principal of the various tribes, which were all more or less cannibal. Many books have been issued in their language, Efik. Education, formerly in the hands of the missions, has been taken up by the government, which has established a system of primary and secondary schools, and a High School with a large staff.—NEW CALABAR is a district between Brass and Bonny, east of the Niger Delta. Its trade centre is the town of Port Harcourt, at the mouth of

the New Calabar River, the most easterly of the mouths of the Niger (q.v.).

Calabar Bean, or the ordeal bean of Old Calabar, is the seed of *Physostigma venenosum*, of the order Leguminosæ. It is a climber nearly allied to the scarlet runner, but reaches a height of 50 feet or more, and is perennial, with a slender woody stem. It yields its virtues to alcohol, and imperfectly to water. It is used in the form of an emulsion by the natives of Africa, as an ordeal when persons are suspected of witchcraft, the accused being declared innocent if he can throw off the poison by vomiting. In 1855 Sir Robert Christison very nearly fell a victim to his zeal for science in experimenting with this bean, dangerous symptoms having been produced by 12 grains of the kernel which he swallowed. In 1861 Sir T. R. Fraser tried the effects upon himself of doses of 6, 8, and 10 grains. The general symptoms were epigastric uneasiness, great feebleness, dimness of vision, salivation, giddiness, and irregular, feeble, and slow heart-action. About the same time he

Calabar Bean :
a, flowering branch; b, seed-pod; c, seeds.

made the interesting discovery that, when placed on the eyeball, this substance contracts the pupil, and produces near-sightedness; and it is now frequently employed for these purposes in ophthalmic surgery. It has also been administered in tetanus and other nervous diseases. Fraser has also shown that since its action is precisely contrary to that of belladonna or its active alkaloid atropine, the latter can with certainty be administered (even in quantities which would be injurious or fatal under ordinary circumstances) as an antidote. However, if a large quantity has been taken, then the effect of the atropine increases the poisoning, with fatal results. The Calabar bean owes its activity to the presence of a very powerful alkaloid, called physostigmine or eserine, which, in the form of discs containing $\frac{1}{100}$ th grain of physostigmine sulphate, is much used in ophthalmic operations. It is of use after injuries to the cornea; it stimulates the iris and ciliary muscle; it reduces intra-ocular pressure, and contracts the pupil.

Calabash Tree (*Crescentia cujete*), a small tree belonging to the Bignoniaceæ (q.v.), common in tropical America and the West Indies. The wood of the tree is tough and flexible, and useful for coach-making; but by far the most useful part is the hard shell of the fruit, which, under the name of *calabash*, is much used in place of bottles for holding liquids, and for goblets, cups, water-cans, &c.,

and in fact furnishes most of the domestic utensils of the natives. These shells may even be used as kettles for boiling liquids, and they will bear this several times without being destroyed. They are sometimes polished, carved, and dyed, and otherwise ornamented. The rinds of gourds are sometimes similarly used, and called calabashes.

Calabria, the south-west peninsula of the kingdom of Italy. The area is 5800 miles, the population a million and a half. It is traversed all its length of 160 miles by the Apennines, whose summits in the region in the north, known as La Sila, and the Aspromonte in the south, are crowned with pines, while forests of oak, beech, and chestnut cover their sides. The valleys between the various hills afford rich pasture, especially in the north, to which, where swamps have not rendered them uninhabitable from malaria, whole colonies migrate in spring-time with their flocks and herds. There is no river of any importance in Calabria; but the valleys and plains, watered by such streams as there are, are very fertile, yielding wheat, rice, cotton, liquorice, saffron, sugar cane, vine, orange, lemon, olive, fig, and mulberry in luxuriance. Iron, tin, lead, silver, alabaster, marble, and graphite are among its minerals. The fisheries of its coasts, particularly the tunny and anchovy fisheries, are important. The district is very subject to earthquakes, as in the awful visitations of 1905 and 1908. The compartimento of Calabria is divided into the provinces of Cosenza, Catanzaro, and Reggio (see ITALY). In ancient times the name Calabria was given to the south-east peninsula, nearly corresponding to the modern province of Lecce, no portion of which is included in modern Calabria, which answers to the ancient *Buttium*. The name, as now applied, appears to have originated with the Byzantines sometime prior to the conquest of the country by the Normans in the 11th century. The people, proud, fiery, and revengeful, were long celebrated as among the fiercest of banditti. They strenuously resisted the power of France during the Napoleonic campaigns, and were not finally subdued until 1810.—*Il Calabrese* ('the Calabrian') is the name by which the painter Maltia Preti (1613–57) is usually known. See Norman Douglas, *Old Calabria* (1915).

Caladium. See COCCO.

Calahorra, a town of Spain, 30 miles SE. of Logroño by rail. It occupies the site of the ancient *Calagurris*, the birthplace of Quintilian, celebrated for its obstinate but unsuccessful resistance to Pompey's legate (78 B.C.). It has an old cathedral, and 10,000 inhabitants.

Calais, a seaport of France, in the department of Pas-de-Calais, on the Strait of Dover, here 21 miles wide, by rail is 184 miles N. of Paris. It ranks as a fortress of the first class, the old walls, dividing it from its suburb, Saint Pierre, having been demolished since 1883, and their place supplied by a ring of exterior forts. The gate built by Richelieu in 1635, and immortalised by Hogarth, has disappeared; but the cardinal's citadel (1641) still stands on the west of the town. On the south and east are low marshy grounds, which could be submerged in the event of an invasion. The harbour, which was nearly dry at low-tide, was greatly improved during the last quarter of the 19th century. Calais is one of the chief ferry-ports for England. With the air of a Flemish more than of a French town, Calais has not much to boast of in the way of objects of interest. The church of Notre Dame has a fine 'Assumption' by Seghers. The picturesque hôtel-de-ville was rebuilt in 1750, and restored in 1867. The adjoining Tour de Guet (1214) served as a lighthouse till 1848; the present

lighthouse is 190 feet high. A museum (1884) occupies the site of the Hôtel Dessin, where Sterne lodged, and Scott, and Lady Hamilton. A handsome English church was built in 1862. The chief manufacture is tulle or bobbin-net, introduced by English from Nottingham in 1818. The fisheries, once important, have greatly declined. Pop. (1872) 39,700; (1881) 44,315; (1921) 73,001. See HARBOUR.

Calais was a small fishing-village till, in 997, it was improved by Baldwin IV., Count of Flanders, whilst in 1224 it was enlarged and strengthened by Philip of France, Count of Boulogne. In 1347, after a twelvemonth's siege, it was captured by Edward III. of England, and the self-devotion then shown by six of the citizens is commemorated by a monument by Rodin. The English retained it until 1558, when it was captured by the Duke of Guise, its garrison of 800 men holding it for a week against his 30,000. Since then (with the exception of two years, 1596-98, when it was in the possession of the Spaniards) Calais has continued French. Charles II. of England resided some time there; and James II. arrived with French troops for the invasion of England, which the destruction of the French fleet prevented him from accomplishing. Louis XVIII. landed at Calais in 1814, after his exile.

Calais, a city of Maine, 82 miles ENE. of Bangor, at the head of navigation of the St Croix River, on the Canadian boundary, has some ship-building and a large lumber trade; pop. 6000.

Calamander Wood, a cabinet-wood of the greatest value, resembling rosewood, but much surpassing it in beauty and durability. The tree which produces it is *Diospyros hirsuta*, a species of the same genus which produces ebony and the persimmon; it grows in SE. India and Ceylon. But this tree 'has been so prodigally felled, first by the Dutch, and afterwards by the English, without any precautions for planting or production, that it has at last become exceedingly rare.' It yields veneers of unusual beauty, 'dark wavings and blotches, almost black, being gracefully disposed over a delicate fawn-coloured ground.' Its density is very great, a cubic foot weighing nearly 60 lb., and it takes an exquisite polish. The name is supposed to be a corruption of Coromandel Wood.

Calamary, or **SQUID**, a popular name applied to numerous forms of Cuttle-fish or Cephalopoda (q.v.), but more especially to the common *Loligo vulgaris*. The genus belongs to a family known as Myopsidæ, including Cephalopoda with ten arms, a horny (except in Sepia) pen, the remnant of a shell, and a cornea closing the eye. The body is long, pointed behind, and bears two triangular posterior fins. The skin round the mouth bears suckers; the two longest seizing-arms bear four or more rows of suckers, and are not entirely retractile; one of the shorter arms becomes much modified in the male to form a 'hectocotylus' or sperm-

Common Calamary (*Loligo vulgaris*).

holding organ. About two dozen species of *Loligo* are known from all seas, and some fossil forms

occur in the Jurassic strata. The Common Calamary (*Loligo vulgaris*) has a pinkish or yellowish white colour, with purplish-brown spots, and measures a foot and a half or more in length, not including the arms. It is common in the Atlantic and Mediterranean, swims actively in shoals, and is sometimes eaten, or used as bait. For further details, see CUTTLE-FISH.

Calambac. See ALOES-WOOD.

Calamine, an ore consisting essentially of carbonate of zinc. Its primary form is a rhomboid, and it occurs in small obtuse-edged crystals; usually, however, it is compact and massive, often assuming botryoidal forms. It is white, yellowish-white, brown, green, or gray; is sometimes opaque, sometimes translucent; is brittle, and has an uneven conchoidal fracture. It occurs in beds and veins in rocks of various kinds, but most commonly in limestone. Mendip, Matlock, Alston Moor, Leadhills, and Wanlockhead are British localities. Calamine is an important ore of zinc.—The silicate of zinc—hemimorphite—is by some mineralogists called Calamine.

Calamint (*Calamintha*), a genus of Labiatae, nearly allied to balm and thyme. *C. officinalis* is not infrequent in England. It has an agreeable aromatic mint-like odour, is used by the country-people to make herb-tea, and enjoys a widespread traditional repute as a pectoral medicine. *C. clinopodium* is Wild Basil, and *C. Acinos* Basil Thyme. The common calamint is found in North America, with several native species.

Calamis, an Athenian sculptor of the first half of the 5th century B.C.

Calamites, a group of fossil plants which make their first appearance in the Devonian, occur abundantly in the Carboniferous, and seem to die out in the Permian strata. There is little doubt as to the true affinities of these plants—they are most probably related to the Equisetaceae, and are believed to be a kind of gigantic 'horse-tails.' The stem had a soft inner pith, surrounded by a ring of wood, and an external bark. The well-known fossil, with its longitudinal ribs and furrows, replaces the central pith, and thus yields a cast of the inner surface of the woody zone. The ribs and furrows are transversely jointed at intervals—these intervals sometimes increasing or decreasing regularly, or in other cases being equal or irregularly different in length. (In one series the longitudinal furrows of the pith-casts do not alternate at the joints or nodes, and these fossils are now separated from Calamites proper under the genus of *Archæocalamites*.) In some stems long narrow branchlets proceed from the transverse joints, and in others branches bearing whorls of small branchlets or long narrow pointed leaves. The branch-scars occur periodically, the node-bearing scars being separated from each other by a certain number of joints without branches. The root termination is conical. Some of the species were provided with thick, and others with thin, bark. Calamites seem to have grown in dense brakes on low alluvial flats, and perhaps even in water. They seem to have budded out at the base, forming clumps of plants, while to support themselves they threw out cord-like roots from the lower part of the stem. The fruits were long and generally thin spikes, bearing spore-cases under scales, and were attached to the twigs or branches. Some of the forms reached a length of 30 feet.

Lower part of *Calamites cannaformis*.

Calamus, the reed pen which the ancients used in writing, was made of the stem of a reed growing in marshy places, probably *Arundo Donax* (see REED), of which the best were obtained from Egypt. The stem was first softened, then dried, and cut and split with a knife (*scalprum librarium*), as quill pens are made. To this day the Orientals generally write with a reed (Arab. *Kalam*).

Calamus, the traditional name of the Sweet Flag (*Acorus Calamus*), which is no doubt the 'Calamus Aromaticus' of Roman authors, and probably the sweet calamus and sweet cane of Scripture, although it has, however, been attempted to identify calamus with one of the fragrant grasses (see LEMON-GRASS) which yield the grass-oil of India. The sweet flag, although resembling Iris in habit, belongs to the order Aroideæ, and is widely distributed through the Eastern palaearctic region, and is also indigenous to North America. It is said to have been introduced into Europe from Asia Minor in the 16th century, and is now widely naturalised in ditches and by the sides of ponds.

A, *Acorus Calamus*, showing rhizome; B, flower-head: c, separate floret; d, floral diagram, showing essentially tri-locous type; e, vertical section of ovary; f, single ovule.

Hooker indeed regards it as a native of Britain. The root-stock yields an aromatic stimulant and tonic, which has fallen into disuse in regular medicine, but is still of high repute in the East. It is in fact cultivated in Ceylon and Burma. It is sometimes used to flavour beer, and in the perfuming of tooth-powder and snuff; and was masticated to clear the voice and sweeten the breath. It is also made into confections and used in the preparation of liqueurs in Germany, &c. The plant was formerly used to strew floors instead of rushes, and particularly in cathedrals on festival days. The name Calamus is also given to a genus of palms. See RATTAN, and DRAGON'S BLOOD.

Calamy, EDMUND, a Puritan divine, was born in London in 1600. He studied at Pembroke Hall, Cambridge (1616-19), where he attached himself to the Calvinistic party; and afterwards became domestic chaplain to Felton, Bishop of Ely. In 1626 he was appointed lecturer at Bury St Edmunds, but resigned his office when the order to read the *Book of Sports* began to be enforced (1636). In 1639 he was chosen minister of St Mary's Aldermanbury, London. He now entered warmly into the controversies of the time, and became noted as a leading man on the side of the Presbyterians. He had a principal share in the composition of *Smectymnus* (q.v.), a work intended as a reply to Bishop Hall's *Divine Right of Episcopacy*, and one of the most able and popular polemics of the day. Like the mass of the Presbyterian clergy, he was monarchical and not republican in his political opinions. He disapproved, therefore, of the execu-

tion of Charles, and of Cromwell's protectorate, and did not hesitate to avow his attachment to the royalist cause. He was one of the deputies appointed to meet Charles II. in Holland, and congratulate him on his restoration. His services were recognised by a royal chaplaincy and the offer of the bishopric of Coventry and Lichfield, which he refused through conscientious scruples (his wife's, according to Tillotson). Ejected for nonconformity in 1662, he continued to attend service in his old church, till heart-broken by the Great Fire of London, he died 29th October 1666. He had published nineteen sermons, &c.—Two of his five sons were educated for a religious profession: the one, Dr BENJAMIN CALAMY (1642-86), rose to be a prebendary of St Paul's, and published *A Discourse about a Scrupulous Conscience*, dedicated to his patron, Judge Jeffreys; the other, EDMUND CALAMY (1635-85), was ejected for nonconformity. His son, EDMUND CALAMY, D.D., born in 1671, studied three years at Utrecht, and, declining Carstares's offer of a Scots professorship, from 1694 was a Nonconformist minister in London. He visited Scotland in 1709, when Edinburgh, Glasgow, and Aberdeen all conferred honorary degrees on him; and he died 3d June 1732. Of his forty-one works, the best known are his *Account of the Ejected Ministers*, and his interesting *Autobiography*, first published in 1829.

Calañas, a town of Andalusia, Spain, about 27 miles N. of Huelva, and 13 miles NE. of Tharsis, with which it was connected by rail in 1887. Here is a large copper-mine. Pop. over 8000.

Calas, JEAN, a French Protestant, remembered as a victim of fanaticism and injustice, was born in Languedoc in 1698. He lived as a tradesman of good character in Toulouse. In 1761, one evening after supper, the eldest son of the Calas family, Marc Antoine, a youth addicted to gambling, and subject to fits of deep melancholy, was found hanged in the warehouse. There was not a shadow of a reason for doubting that the young man committed suicide; but popular rumour accused the father, or other members of the Calas family, of murdering the eldest son, 'because he had contemplated conversion to Catholicism.' It was also asserted that a young man named Lavaysse, who was in the house on the fatal evening, had been despatched 'by the Protestants of Guyenne to perpetrate the murder.' The clergy exerted all their influence to confirm the populace in their delusion. In consequence of the popular excitement the family of Calas was brought to trial for the murder, and several deluded and (perhaps) some bribed witnesses appeared against them. A Catholic servant-maid and the young man Lavaysse were also implicated in the accusation. Calas brought forward many most convincing arguments in his defense, but they were of no avail, and the parliament of Toulouse sentenced the wretched man—by a majority of 8 votes against 5—to torture and death on the wheel! The old man was accordingly put to death on the wheel in 1762. His property was confiscated. His youngest son was banished for life from France, but was captured by the monks, and compelled to abjure Protestantism. The daughters were sent to a convent. The young man Lavaysse was acquitted, and the widow of Calas escaped into Switzerland, where she was so fortunate as to excite the benevolent interest of Voltaire, who brought the whole affair before the public, and, in his book *Sur la Tolérance*, proved that Calas had fallen a victim to religious hatred and popular fanaticism. A revision of the trial followed, and, after full investigation, the parliament at Paris in 1765 declared Calas and all his family innocent.

Louis XV. gave the sum of 30,000 livres to the bereaved family, but neither the parliament of Toulouse nor the fanatical monks were ever brought to account. See Coquerel, *Calas et sa Famille* (2d ed. 1870); Dryander, *Der Prozess Calas* (1887).

Calascibetta, a town in the Sicilian province of Caltanissetta, built on a steep and isolated height opposite Castrogiovanni (q.v.), and 64 m. SE. of Palermo; pop. 9000.

Calatafimi, a town of Sicily, 20 miles SE. of Trapani, named after its ruined Saracenic castle, Kalat-al-Fimi. Here, in 1860, Garibaldi defeated the Neapolitans. Pop. 11,000.

Calatayud (Arab., 'Ayud's Castle'), a city of Aragon, Spain, on the Jalón, 130 miles NE. of Madrid. It is built out of the ruins of ancient *Bibulis*, the birthplace of Martial, which lay about 2 miles to the east. Pop. 11,000.

Calathea, an American genus of Marantaceæ (Scitamineæ), with beautiful leaves springing from a short, root-like stem.

Calatrava la Vieja, a ruined city of Spain, on the Guadiana, 12 miles NE. of Ciudad Real. Its defence against the Moors, undertaken by Raymond, abbot of Fitero, and Diego Velasquez in 1158, after it had been abandoned by the Templars, is famous on account of its having originated the Order of the Knights of Calatrava, which was instituted at Calatrava in 1158, by King Sancho III. of Castile, and was at several periods associated with the Cistercian monks. Their almost uniform success against the Moors gave rise to rashness, and in 1197 they were defeated and nearly exterminated, the survivors transferring the seat to the castle of Salvatierra. In 1523 the grand-mastership was transferred to the crown by a papal bull, the knights being permitted to marry once by way of compensation for their loss of independence. Since 1808 the body has been continued as an order of merit.

Calaveras, an inland county of California, E. from San Francisco, with a picturesquely varied surface, including hills, cañons, prairies, and forests of oak and pine, besides a grove of mammoth trees that attracts many visitors. The county is rich in granite, quartz, limestone, and slate, and copper and gold are mined.

Calbe. See KALBE.

Calcareous, in Chemistry, is a term applied to substances containing much lime (Lat. *calx*). Thus *Calcareous waters* are those which hold in solution much carbonate and sulphate of lime, and which are generally known as hard waters, and form a deposit in kettles and other vessels when heated therein.—*Calcareous rocks* are those in which lime forms the prevailing element. They may be chemically formed, as in the case of tufas, where a saturated solution of carbonate of lime in water is deposited from evaporation or other causes; but they are generally aqueous rocks, the materials of which are supplied by animal remains. Thus, many rocks, like the mountain-limestone, are composed of shells, corals, and encrinites; while others, like chalk, consist largely of foraminifera and fragments of other marine organisms. A crystalline structure, varying in degree from the partially crystallised carboniferous limestones to the saccharine statuary marble, is produced in calcareous rocks by metamorphic action. Oolite is a variety of limestone composed of small egg-like grains resembling the roe of fish. The existence of lime in rocks can always be detected by the application of dilute hydrochloric acid, when it effervesces from the liberation of the carbonic acid. Pure lime is obtained from calcareous rocks by calcining them—i.e. by driving off the carbonic acid and other

volatile matter by heat.—*Calcareous soils* are produced from the disintegration of calcareous rocks. When the rocks are perfectly pure, they generally yield barren soils, as in many chalk and limestone districts of Britain; but when the lime is mixed with clay, so as to form marl, and has a little vegetable matter added, it forms an excellent though rather light soil. Calcareous soils are difficult of drainage, owing to the property that soft lime has of retaining water, although it easily yields it up by evaporation. Such soils are consequently soon dry at the surface after rain, but yet rarely suffer severely from drought.

Calcareous Tufa, or CALC-SINTER, consists of carbonate of lime, and is a deposition from springs, streams, or underground water, from which it is precipitated partly by the escape of carbonic acid which acts as a solvent, and partly by evaporation of the water. It is usually white, creamy-white, yellowish, or brownish in colour, but other hues occur, and variegated and mottled varieties are not uncommon. It is of variable texture and consistency; some kinds being rather soft, brittle, and friable, and porous or cellular. These cellular varieties have been deposited from the waters of springs, and often contain vegetable and animal remains, as leaves, twigs, nuts, moss, insects, land and freshwater shells, &c. The so-called 'petrifying springs' of Mortlock afford a good example of the formation of calcareous tufa. In some regions the deposition from calcareous waters is on a very extensive scale, as along the river Anio, at Tivoli, near Rome, where calcareous tufa occurs in masses many feet in thickness. In that district the formation is harder and more compact, and under the name of *travertino* is used as a building stone at Rome. Calcareous tufa is abundantly deposited from thermal springs, as in the Yellowstone Region, North America. The calcareous incrustations so commonly seen in caverns in limestone rocks are varieties of calcareous tufa. They are known as *Stalactites* and *Stalagmites* (q.v.).

Calceolaria (Lat. *calceolus*, 'a little shoe'), a South American genus of Scrophulariaceæ (q.v.), ranging along the western slope of the Andes and southwards to the islands. Several species have reached the Falkland Islands, New Zealand, and Mexico. The species are undershrubs or herbs, mostly perennial, and have terminal panicles or cymes of showy flowers of the familiar two-lipped slipper, or 'fisherman's basket'-like flowers. The colours in this genus vary greatly, and florists have produced innumerable hybrids and varieties since they were introduced about 1830. They are largely cultivated as half-hardy or greenhouse plants, and are easily propagated by cuttings; they grow freely, but require to be well watered. Some of the species are used in South America for dyeing.

Calchas, the famous soothsayer of the Greeks in the Trojan war, was the son of Thestor and Mycene. He foretold the length of the siege, and when the fleet was detained at Aulis by adverse winds, demanded the sacrifice of Iphigenia. He is said to have died at Colophon, from chagrin at being surpassed in soothsaying by one Mopsus.

Calciferos Epoch, one of the subordinate divisions of the Lower Silurian System of North America. The division is characterised by the presence of calcareous sandstones and limestones. In Scotland a subdivision of the Carboniferous System (q.v.) is known as the Calciferous Sandstone group.

Calcination, or CALCINING (see CALX), is the process of heating or roasting in furnaces or in heaps the various metallic ores. It is resorted to as the first stage in the extraction of the majority

of the common metals from their ores, and is essentially a process of oxidation.

Calcite, **CALCAREOUS SPAR**, or **CALC-SPAR**, the name usually given by mineralogists to carbonate of lime, rhombohedral in its crystallisation. It differs from aragonite only in crystallisation (see **ARAGONITE**). Calcite is one of the commonest minerals. Marble, for example, is composed of small crystalline granules of this mineral. It is abundantly met with in very many rocks as a *secondary* mineral; that is to say, it is a decomposition-product—the result of the chemical alteration of various rock-constituents, such as the felspars. Thus it frequently occurs in the cracks, fissures, and vesicles of igneous rocks (see **AMYGDALOID**). It often completely fills cavities in rocks of various origin; and although it has been prevented by want of space from assuming a crystalline form, is readily divided by the knife and hammer into rhomboids, the primary form of its crystals being a rhomboid, of which the greatest angles are $105^{\circ} 5'$. Its secondary forms are more numerous than those of any other mineral; some seven hundred have been observed. One of the most common, a rather elongated pyramid, is sometimes called Dog-tooth Spar. Calcite is colourless and transparent, except in consequence of impurities which may be present in it; and when perfectly transparent, it exhibits in a high degree the property of double refraction of light. The presence of foreign substances frequently renders calcite gray, blue, green, yellow, red, brown, or even black.—Iceland Spar is a name given to calcite, at least to the finest colourless and transparent variety, found in Iceland, filling up clefts and cavities in basalt-rocks. Slate Spar is a lamellar variety, often with a shining, pearly lustre and a greasy feel, and is found in Wicklow and Glen Tilt, and at Kongsberg in Norway.

Calcium (sym. Ca, atomic weight 40.1) is the metal present in chalk, stucco, and other compounds of lime. It may be obtained by passing a powerful current of electricity through fused chloride of calcium, CaCl_2 , when the metal separates in minute globules. It is a yellowish-white metal, can be rolled into sheets and hammered into leaves, and is intermediate between lead and gold in hardness. It has a specific gravity of 1.55, being more than a half denser than water. At ordinary temperatures, it slowly tarnishes by oxidation; and when placed in contact with water, it rapidly decomposes the water, H_2O , forming lime, CaO , whilst hydrogen escapes. To be retained bright, calcium must be kept under the surface of naphtha. At a red heat, it melts and burns with a dazzling, scintillating white light. Metallic calcium, costing till of late £9 per ounce, dropped in price to 9d. per ounce. Many of the compounds are of the highest importance. When oxidised, either by exposure to air or by combustion, it forms an oxide, Lime (q.v.), having the composition of 40 parts of calcium and 16 parts of oxygen. This, when united with water, yields a hydrate, slaked lime. For the sulphide, see **LUMINOUS PAINT**. Sulphate of calcium, CaSO_4 , is the chief constituent of Gypsum (q.v.). It is present in most drinking-waters, rendering them *permanently hard*, because the sulphate of calcium is not precipitated by boiling the water. Temporary hardness, due to the presence of carbonate of calcium, CaCO_3 , or chalk, is removable by boiling, when the carbonate, which is retained in solution as bicarbonate, is readily decomposed into Carbonic Acid (q.v.), which escapes as gas, and chalk, which falls to the bottom.

Calcium carbide, CaC_2 , a compound of calcium and carbon, was discovered by Edmund Davy in 1836, but till about 1892 it was only produced in small quantities and as a laboratory curiosity. Its

property of decomposing water and forming acetylene gas was known, but it was only when, in 1892, chemists in America and Paris simultaneously discovered a method of producing it in quantities that it became commercially of importance, and since that time acetylene gas for illuminating purposes has enormously developed. A mixture of powdered lime and coke-dust is submitted to the action of carbon electrodes at a temperature of about 3300°C . The fused material is removed when cool. Carbide, as it is generally called, is a brown crystalline compound with a specific gravity of 2.22, and is insoluble in most acids and all alkalis; see **ACETYLENE**, **GAS-LIGHTING**.

Calcium phosphate is used in medicine to supply phosphorus for the bones and nerves, the carbonate as an antacid. For calcium sulphate, carbonate, chloride, see **LIME**. For the calcium light, see **LIME-LIGHT**.

Calc-spar. See **CALCITE**.

Calculating Boy. See **BIDDER** (G. B.), **COLBURN**.

Calculating Machines, as distinguished from simple contrivances such as the Abacus, Schwanpan, Napier's Bones, the Verner, Sliding Rules, date from that invented by Pascal about 1632. In this machine the addition of each place of figures was performed separately, and subtraction was effected by the addition of the numerical complements. It is not likely that even Pascal himself found this machine of any practical use. In 1666 Sir S. Moreland invented a machine, about 3 by 4½ inches in size, for adding sums of money. In this machine, as in that of Pascal, the addition of each place or order was made separately by hand. Each place had a pair of wheels unconnected with its neighbours, and the carriages were transferred by hand. The multiplication machine of the same inventor was really nothing more than Napier's Bones on circles instead of strips. Some years later, Leibnitz conceived the idea of an enlarged machine which seems to have been designed for important astronomical calculations, the necessity for which had arisen from the discoveries of Galileo, Kepler, and the other astronomers of that century. He spent many years of his life, and more than 24,000 thalers (£3600) on this project, but all that remains is a model still preserved at Göttingen. In 1775 Viscount Mahon, afterwards Earl Stanhope, invented a machine which performs the four rules of arithmetic. It is about 6 by 8 by 18 inches in size. The operator, using both hands, pushes a frame containing twelve prisms of ten sides each, mounted side by side, to and fro in the line of their axes, performing in one direction addition, and in the other subtraction. Each face of the prism has a rack, which engages a toothed wheel, and turns it as many teeth as there are teeth in the rack—0, 1, 2, &c. as required. There is a simple hand adjustment which works like the 'points' of a railway, and shunts the prisms out of the way on each return motion, during which the carriage is done. The set of prisms can be moved laterally for stepping. Multiplication and division are done by successive addition and subtraction. In 1777 a second machine on the same lines was constructed. In 1779 a German named Hahn invented a circular machine; followed in 1784 by another by Muller, likewise circular and worked by a handle at the centre. Subtraction was not done directly, but the arithmetical complement was read off instead of the sum. Stepping was done by shifting the upper plate, multiplication and division by successive addition and subtraction. It was about 12 inches outside diameter.

The next machine invented was one of a very different type. About 1812 Charles Babbage (q.v.), then a student at Cambridge, conceived the idea that logarithmic, trigonometric, and other tables could be calculated by the method of 'differences' by a machine capable of performing only simple addition. An immense range of nautical and astronomical tables lies within these limits, and can be produced by calculating the first few differences, and setting them in the machine. About 1822 he had made a small trial piece, and soon after undertook to superintend, without payment, the construction for the government of a machine to calculate and print such tables. It would have been, when completed, about 6 feet high by 3 broad and 1 deep, and would have had six columns of differences of eighteen or twenty places each. It was never completed, and the design was abandoned in 1842. It is enough here to say that the engagement was to the inventor a disaster, harassing him continually through twenty years; and to government all that remains is a fragment of a beautiful machine which does its work with unerring accuracy, but is useless. It stands in the South Kensington Museum.

About 1850 M. Thomas of Colmar produced a calculating machine of a high degree of excellence, which performs the four rules of arithmetic with surprising speed, and is in extensive use. In this machine, instead of the prism with racks, as in Stanhope's machine, there is a cylinder, on the different sections of which are successively 0, 1, 2, 3, &c. teeth; with each cylinder is a toothed wheel sliding on its axis, and this being brought by a finger-knob opposite the proper section of the cylinder, 0, 1, 2, 3, &c., as required, is added. These cylinders are all moved simultaneously in one direction. The carriage is made afterwards successively. One multiple is produced by each turn of the handle. The stepping is done by raising a long frame or lid on hinges, moving it down one place and letting it fall into the new position. There are contrivances for reversing the motion for subtraction, for destroying the momentum of the moving parts, and for locking them. In 1883 Mr J. Edmonson of Halifax patented a circular machine on the general lines of Thomas's, but modified to suit the circular arrangement. Felt's comptometer (1887, subsequently improved) and Burrough's registering accountant (1888) are American machines extensively in use. The latter is an addition machine of 81 keys, with a capacity of 2000 entries per hour, automatically printing the addenda and the total sum. Behr's addition machine (1892), limited to sums under 500; Ilgen's calculator (1888), limited to sums under 1000; and Runge's addition machine (1896), adding numbers of several figures, are German, and also largely used.

Of the analytical engine of Charles Babbage, which does not exist except on paper, there are 400 detailed drawings to scale, with volumes of notes and rough sketches. In 1833, when the fragment of the difference engine was put together, Babbage found that several surprising results which had not been anticipated could be easily produced by causing the table to influence the last difference in various ways; see his *Ninth Bridgewater Treatise* (1833).

Cash Registers are a form of calculating machines which have come into almost universal use in retail establishments as records of cash transactions. The first practical machine of this kind was patented in 1879 by James Ritty of Ohio, U.S. Originally the record was made on adding wheels and shown on a dial by hands. In the National Cash Register Company's 'detail adders,' the mechanism is operated by pressing registering keys.

Each registering key is connected with a corresponding adding wheel inside the register, which shows the total amount of registrations made on that key. For example, if the 'penny' key be pressed five times, its corresponding adding wheel shows a total of fivepence. Many modifications are made.

Another form of calculating machines is the electric tabulating machine devised by Hollerith for recording and summarising the United States census returns. A keyboard of 240 characters operates on punches which perforate holes in cards corresponding to the facts to be recorded for each individual, such as sex, age, or colour. The perforated cards are fed into the machine, which by means of the holes and electric devices records the facts indicated by the holes. Sorting-boxes next secure a combination of the facts recorded, and by means of electric connections the record is made. For some modern machines, see the *Napier Tercentenary Celebration Handbook* (Edin. 1914).

Calculus, or **STONE** (in Medicine), a hard concretion formed within the animal body, in consequence of the deposition in the solid form of matters which usually remain in solution (see **CONCRETION**). The calculi most commonly met with are those formed in the kidneys or bladder (*Urinary Calculus*), and those formed in the gall-bladder or biliary ducts (*Biliary Calculus*).

Urinary Calculus is a disease of all ages, but most common in early and in advanced life and in the male sex. It is also very frequent in gouty persons, or among those who pursue sedentary occupations, and live freely. It is rare among those who live much in the open air, or who take much violent exercise, and use little animal food and wine. Among sailors it is peculiarly rare. In certain parts of the country the disease is said to be frequent, as in Norfolk, and perhaps along the east coast of Scotland. In some parts of India, too, where some of the predisposing circumstances mentioned above can hardly be said to prevail, stone is by no means uncommon. It would appear, therefore, that the predisposing causes of calculus are still very imperfectly understood. In its early stages the disease usually presents itself in the form of *Gravel*, shown by the passage of numerous very small portions of gritty concretions, which may be observed in the urine as a deposit like sand, or like small grains of Cayenne pepper. When such deposits occur frequently, especially if they are present at the time of passing the urine, and not merely after it has cooled, there is reason to apprehend the formation of calculus. If, in these circumstances, there are pains of a dull character in the loins, with occasional twinges of sharper suffering, no time should be lost in seeking medical advice. If a fit of very severe pain should occur in a person for some time affected with gravel, if the urine be bloody, if agonising twinges, commencing in the loins, sting downwards into the thigh or the groin, it is probable that a stone has already formed in the kidney, and is being displaced towards the bladder. Calculus in the bladder is at first attended with little suffering, as compared with that caused by the stone in its passage downwards from the kidney; but unless removed or evacuated, the calculus is sure to enlarge, and it then becomes the cause of one of the most painful diseases that afflict humanity. The existence of a stone in the bladder, however, should never be taken for granted without a surgical examination, as all the symptoms are deceptive in certain cases. The most striking, and perhaps the most trustworthy evidence of stone in the bladder, apart from the use of the sound (see **LITHOTOMY**), is smarting and burning pain experienced after the bladder has been emptied, together with occasional presence of blood in the urine. The correct appreciation of

all the symptoms, however, demands considerable familiarity with such cases.

The discovery of the tendency to urinary calculus at an early period of its growth has been greatly aided by the use of the microscope and of chemical tests. Generally speaking, it may be said that whenever the urine, after standing for a few hours, can be observed habitually to contain more sediment than a very slight cloudiness towards the bottom of the vessel, there is room for careful inquiry into the existence of some derangement of the health. But sediments are not all equally apt to determine calculus, nor is the treatment of the different kinds of sediment at all similar; care should therefore be taken to determine, from time to time, whether the character of the sediment may have undergone a change, so that the treatment may be adapted accordingly.

The chief varieties of urinary calculus are—(1) uric acid (red sand) and urate of ammonia; (2) oxalate of lime; and (3) phosphates of ammonia, magnesia, lime, &c. Calculi formed of other substances do occur, but much less frequently. Calculi are sometimes found to be composed of numerous successive layers, having a perfectly distinct chemical composition. Urates and phosphates in particular frequently succeed each other, and form what is called an alternating calculus.

Alternating Calculus:

a, uric acid nucleus; b, oxalate of lime; c, phosphates of lime, and of magnesia and ammonia.

When calculus has once fairly formed in the urinary passages, it seems probable that no absolute cure exists except the removal of it, if possible, from the body (see LITHOTOMY and LITHOTRITY); but in the stage of gravel, and still more in the earlier stages detected by careful examination of the urine, much may be done to check the tendency to this distressing and dangerous malady. The chief remedies consist in careful regulation of the diet and mode of living, together with the use of solvents adapted to the particular form of deposit found to be habitually present. See URINE.

Biliary Calculi or *Gall-stones* almost invariably consist of Cholesterin (q.v.) with a variable proportion of biliary pigments, lime, mucus, &c. They are generally formed in the gall-bladder, and while they remain there often give rise to no inconvenience. Their presence is usually first revealed by their passing from the gall-bladder into the cystic duct (see BILE, LIVER), and giving rise to the train of symptoms known as *biliary colic*. Severe pain, either sudden or gradual in its onset, is felt just below the ribs on the right side, and radiating in various directions, but most commonly upwards. It is almost always accompanied by vomiting. When the calculus reaches the common bile-duct it closes it for the time, and if it does not pass

onward into the intestine within a few hours, leads to jaundice. The pain in a severe case is probably the most intense of all known forms of suffering. Happily the attack rarely lasts beyond a few days at most; but, as gall-stones seldom occur singly, is very likely to be repeated at some subsequent period. During such an attack copious draughts of hot water containing bicarbonate of soda in solution often give relief; but large doses of morphia or opium are generally required to control the pain. When the calculus has reached the intestine it is passed onwards and voided with the feces.

Though in the majority of cases gall-stones are thus harmlessly discharged, they may give rise to inflammation, ulceration, or other dangerous complications at any part of their course—in the gall-bladder, the bile-ducts, or the intestines.

The cause of their formation is obscure. They are more common in the female sex, and rare before the age of thirty. Regular habits, plenty of exercise, and simple diet are believed to be the most important means of preventing their formation.

During the last thirty years the gall-bladder has frequently been opened with success for the removal of gall-stones which were causing serious symptoms; and this operation (cholecystotomy) has now a recognised place in surgery.

Calculus, DIFFERENTIAL and INTEGRAL, sometimes called the Infinitesimal Calculus. The scope of the calculus ranges over the whole field of applied mathematics, and an account of its development would involve an account of the chief difficulties that have been overcome in the problems offered by astronomy, mechanics, engineering, and physical science generally. The following is a sketch of the origin, notions, and method of the calculus.

The invention of the calculus culminated with Leibniz and Newton in the latter half of the 17th century. There need be no surprise at the joint discovery, for after the work of Archimedes, Cavalieri, Roberval, Fermat, Barrow, Wallis, and others, matters were ripe for the generalisation attained by Leibniz and Newton. The calculus as propounded by these two mathematicians showed considerable diversity of detail. As a basis for the theory, Newton took his methods of *prime and ultimate ratios* and *fluents* (see FLUXIONS) both fundamentally the same idea, and developed from the ancient notion of *Exhaustions*, while Leibniz employed his method of *Infinitesimals* (see INFINITE) developed from the *Indivisibles* of Cavalieri as used by Wallis and others. The notations adopted were quite different; and of the two notations that of Leibniz has proved itself the better, although in Britain Newton's did not give way till well into the 19th century.

After considerable fluctuation of opinion as to the proper foundation for the theory of the calculus, the method of *Limits*, a modification of Newton's methods, is now almost universally adopted. Besides those mentioned, the only other method ever received with favour was Lagrange's method of *Derived Functions*.

In the calculus all quantities except mere constants are regarded as changing from one value to another by continuous growth or according to Leibniz by infinitesimal differences or *differentials*; and it will help to the understanding of the subject if we divide such quantities into three groups, a classification which is convenient for our present purpose rather than mathematically essential.

(1) The quantity, or quantities, in which the growth originates—i.e. quantities which vary independently of each other and of all other quantities, and which are hence called the *independent variables*.

(2) The quantities whose value depends on the

value of the independent variables, and which are variously named *dependent variables*, or *functions* of the independent variables (see FUNCTION), or, with special reference to the quantities of group 3, *primitive functions*. The quantities of groups 1 and 2 were called *fluents* by Newton. Taking x as the independent variable we have functions of x such as (i.) x^2 , (ii.) $\frac{1}{2}x^2 + C$, (iii.) e^x , (iv.) $\tan x$, (v.) $F(x)$, where F is a sign denoting some function of x not specified. It is often convenient to use a single letter (as y) to denote such functions and then we have the relations $y = x^2$, $y = \frac{1}{2}x^2 + C$, $y = F(x)$, &c., where y is called the dependent variable.

(3) The third group of quantities is what distinguishes the calculus from ordinary algebra, which deals only with the other two, and the discovery by Leibnitz and Newton of the fundamental importance of this group may be said to constitute the discovery of the calculus. These quantities, which are in general, like group 2, functions of the independent variables, are derived in a peculiar way from groups 1 and 2. They express the *rate of change of a function with respect to its independent variable or variables*. Such a rate is called a *derived function* (denoted by $f'(x)$ if the primitive function be for example $y = f(x)$) or a *differential co-efficient* (denoted by $\frac{df(x)}{dx}$ or $\frac{dy}{dx}$). Group 3, as here defined, corresponds very nearly to what Newton called *fluxions*. The derived functions of the first four primitive functions given as examples of group 2, are (i.) $2x$, (ii.) x^2 , (iii.) e^x , and (iv.) $\sec x$.

Also since $f'(x)$ or dy/dx is in general a function of x , its rate of change with respect to x may be considered, and we thus get a second derived function ($f''(x)$), or second differential co-efficient (d^2y/dx^2). Similarly $f''(x)$ may be treated, and so on.

And now we are in a position to indicate the distinction (from the point of view of pure mathematics at least) between the Differential Calculus and the Integral Calculus. The differential calculus seeks to find the derived function when the primitive function is given, while the integral calculus seeks conversely to find the primitive function when the derived function is given.

The treatment of derived functions involves peculiar difficulties, to overcome which various schemes, as already indicated, have been proposed. We shall try to give a clear idea of the meaning of a Limit, and shall then show how this notion meets the case.

Definition.—If there be a fixed magnitude to which a variable magnitude can be made as nearly equal as we please, and if it be impossible that the variable magnitude can ever be exactly equal to this fixed magnitude, the fixed magnitude is called the limit of the variable magnitude.

Fundamental Proposition.—If two variable magnitudes be always equal to one another while each approaches its limit, then their limits are equal to one another. (An indirect proof of this is easy.)

Example: To prove that a circle is equal in area to the triangle whose base is equal to the circumference, and whose height is equal to the radius of the circle. About the circle describe any regular polygon ABCDEF. Make a triangle whose base A'A'' is equal to the perimeter of the polygon, and whose height is equal to the radius of the circle. In the line A'A'' suppose A'P' equal to the circumference of the circle. Then by increasing the number of sides of the polygon, we can make its area as nearly equal to the area of the circle as we please, but never quite equal to the area of the circle; hence by our definition the area of the circle is the limit of the area of the polygon.

Similarly the triangle O'A'P' is the limit of the triangle O'A'A''. Now, the polygon (a varying magnitude) is always equal to the triangle O'A'A''

Fig. 1.

(a varying magnitude), therefore, by our fundamental proposition, the limits of these varying magnitudes—i.e. the circle and the triangle O'A'P', must be equal to one another.

In the foregoing geometrical illustration of the use of limits, it will be observed that it is the limits themselves that are all-important, the polygon and the triangle O'A'A'' being mere auxiliaries; and so it is always. We shall now take a typical example from the calculus to show the use of limits in the finding of a rate.

Suppose x to be an independent variable, and $y = x^2$ the function under consideration, let us seek to find (1) the average rate of change of x^2 with respect to the independent variable when the independent variable changes from x to $x + \Delta x$, and (2) the limit (if there be one) of this average rate as the interval Δx is diminished.

We take Δx to indicate the change made on x ; let us take Δy to indicate the resulting change in y .

We have $y + \Delta y = (x + \Delta x)^2$
 $= x^2 + 2x\Delta x + (\Delta x)^2$;
 and $y = x^2$
 $\therefore \Delta y = 2x\Delta x + (\Delta x)^2$. (1)

Now $\Delta y/\Delta x$ is the measure of the average rate we seek, and from (1) we have

$$\Delta y/\Delta x = 2x + \Delta x, \quad (2)$$

which is the answer to the first part of our question. For the rest, we remark that by diminishing Δx we can make $2x + \Delta x$ as nearly equal to $2x$ as we please, but never quite equal to $2x$; hence $2x$ is, by our definition of a limit, the limit of $\Delta y/\Delta x$.

This limit is denoted by $\frac{dy}{dx}$. It might be denoted by α/β or any other symbol, only the presence and position of y and x in the symbol $\frac{dy}{dx}$ serve con-

veniently to show of what ratio $\frac{dy}{dx}$ is the limit. dy/dx is called, as has been said, the differential coefficient of y with respect to x , and it may be interesting to get an indication of the origin of this inconveniently lengthy title. In the expansion of $(x + \Delta x)^2$ above, Δx , taken 'infinitely small' by Leibnitz, was called a differential, and $2x$, which turns out to be dy/dx , is the coefficient of the differential; hence the name. The notation of the calculus, being as already stated Leibnitz's, naturally fits best to the infinitesimal theory, but even in quarters where the infinitesimal theory is rejected, the language as well as the notation is often retained for its practical convenience, just as the language of the 'two fluid' theory is kept up in electricity, though the two fluid theory is superseded.

The purely mathematical part of the calculus is concerned largely with the devices for finding the limits of all sorts of functions, as in the above example; and it is only when the calculus is to

be applied to an actual problem, that the use of these limits becomes apparent. We will apply the foregoing result to a problem in mechanics.

Problem.—To find the speed at the end of x seconds of a body which, starting from rest, passes over x^2 feet in x seconds.

Consider the speed at the end of x seconds in relation to the average speed during an immediately succeeding interval. Evidently the speed at the end of x seconds is the limit of the average speed in question, for the average speed can be made as nearly equal as we please to the speed at the beginning of the interval by taking the interval short enough, and the average speed during the interval can never be quite equal to the speed at the beginning. Now the average speed is measured by the length described, divided by the time taken, and is therefore equal to what we denoted by $\Delta y / \Delta x$, hence by our fundamental proposition in limits, the actual speed at the end of x seconds is equal to $\frac{dy}{dx}$ —i.e. is $2x$ feet per second.

Any trouble that has arisen in accepting limits as the basis of the calculus has been due to the adoption (too frequent unfortunately) of a vicious form of the fundamental proposition, which, for the sake of warning, we shall give here. It is as follows:

Suppose A and B to be equal varying quantities, and LtA , LtB to be their limits.

Since $A = LtA + q$ where q is an 'infinitely small' or 'infinitely small' quantity, let us say

$A = LtA$ ultimately (and make an indefinitely small error). (1)

Similarly $B = LtB$ ultimately (another indefinitely small error). (2)

Now $A = B$ (by supposition).

Therefore $LtA = LtB$. (By 'compensation of errors' as explained by Berkeley and Carnot.) This argument is not logical, and it is not necessary. Moreover, as equation (1) is usually adopted in the purely mathematical part of the calculus, while equation (2) is adopted in some application probably long after the student has passed equation (1), the compensation of errors is not seen by him, and he feels as if he were always going a little wrong.

The following example is a type of a large class of problems to which the integral calculus is applied.

The curve TPC is traced out by the point P moving so that PN (y) is a given function of ON (x), or in other words, $y = f(x)$ is the equation to the curve (see GEOMETRY, ANALYTICAL). The problem is to find the area ABDC.

Fig. 2.

function of ON—i.e. of x . Suppose x to change to $x + \Delta x$ —i.e. suppose ON to become ON + NN'. Then A becomes A + ΔA where

$$\begin{aligned}\Delta A &= PNN'P' \\ &= PNN'M + MP'P \\ &= y \times \Delta x + MP'P \\ &= f(x) \times \Delta x + MP'P \\ \therefore \Delta A / \Delta x &= f(x) + MP'P / \Delta x.\end{aligned}$$

Now the limit of $MP'P / \Delta x$ is the ratio of the

area of the triangle MP'P to Δx . But this is one-half of MP'. Also MP' becomes smaller and smaller without limit as Δx approaches zero. Therefore, in the limit, $dA/dx = f(x)$. Here A is the primitive function of x whose derived function is $f(x)$.

The problem of the integral calculus is to find A when $f(x)$ is known. We have $dA = f(x)dx$. Each dA is an infinitesimal increment of A, and the sum of them all is A. This sum of the infinite number of infinitesimal increments is called the 'integral' of $f(x)$, with respect to x , from $x=0$ to $x=OD$. It is symbolised as

$$\int_0^{OD} f(x)dx.$$

Similarly the area ABDC is

$$\int_{OB}^{OD} f(x)dx = TODC - TOBA.$$

The integral calculus is constantly getting into difficulties through the occurrence in applications of it of functions to be integrated that have never been turned out as results of differentiation, while many of the functions that can be integrated have to undergo tedious transformations to bring them under the form of known derived functions.

The CALCULUS OF VARIATIONS has to take account of changes of form as well as of magnitude in the functions mentioned in group 2 above, while the differential and integral calculus, of which the calculus of variations is an offshoot, deals only with changes in magnitude. Such problems as the following fall under its treatment: (1) To find the curve of quickest descent ('brachistochrone') from one given curve to another given curve. It was a special case of this problem proposed in 1696 that gave rise to the calculus of variation. (2) Given the surface of a solid of revolution, to find its form, that the solid contents may be a maximum. (The result of the first problem is a cycloid, of the second a sphere.) Histories of the calculus of variations have been written by Woodhouse (1810) and Todhunter (1861). For CALCULUS OF FINITE DIFFERENCES and CALCULUS OF FUNCTIONS, see the articles DIFFERENCE and FUNCTIONS.

Calcutta, the capital of the province of Bengal, and till 1911 of British India, is situated on the left bank of the Hugli (Hooghly), an arm of the Ganges, in $22^{\circ} 34'$ N. lat., and $88^{\circ} 24'$ E. long., about 80 miles from the sea by the river. Calcutta was founded by Governor Charnock in 1696, by the removal hither from Hugli of the factories of the East India Company. In 1700 three villages surrounding the factories having been conferred upon the company by the Emperor Aurungzebe, in recognition of a present made to his son, Prince Azim, they were forthwith fortified, and received the name of Fort William, in honour of William III. Calcutta is the Anglicised form of Kalikata, as this again is the Moslemised form (1596) of Kali-ghat, a famous shrine of the goddess Kali, which still exists to the south of the city. In 1707 Calcutta had acquired some importance as a town, and was made the seat of a presidency. In 1756, however, a great misfortune befell the rising town; it was unexpectedly attacked by Suraj-ud-Daula (Surajah Dowlah), the Nawab of Bengal, and yielding after a two days' siege, was the scene of the tragedy of the 'Black Hole' (q.v.). The city remained in the hands of the enemy until seven months afterwards, when Clive and Admiral Watson recaptured it, and afterwards concluded a peace with the Nawab. Soon after this, and subsequent to the important victory of Plassey, the possessions of the East India Company were greatly extended by grants made

by the emperor of Delhi. In 1772 it superseded Murshidabad as seat of the central government in India; in 1852 it was erected into a municipality. In 1837 the population of the town proper amounted to 229,700; in 1881 it had increased to 401,671, or, with port and suburbs, 684,658; in 1911 to 1,222,313; and in 1921 to 1,263,292. Besides these, thousands of the three and a half millions who sleep at night in the surrounding districts of Húgli and the twenty-four Parganas flock during the day to Calcutta, on foot, by boat, or by railway, to their daily toil. Of the inhabitants 67 per cent are Hindus, 23·2 Mohammedans, and 3·5 Christians. About 12,000 are Europeans; 14,000 Eurasians; and there are a good many Armenians, Greeks, Jews, Parsees, Chinese, and negroes.

The city extends for about five miles along the river, and is somewhat less than two miles in breadth at its broadest part, the area being nearly 8 sq. m. (30 with suburbs), and is comprised for the most part between the river and the Circular Road, a spacious roadway which marks the landward boundary of the city proper. Howrah and other villages on the opposite side of the river contain the government warehouses, large ironworks and timber-yards, a number of the principal jute-

Among other fine buildings is the Government House, a magnificent palace erected (1799-1804) by the Marquis of Wellesley. Beyond this, extending northwards along the river-bank, is the Strand, 2 miles in length, and 40 feet above low-water, with various ghats or landing-places. It is adorned by many fine buildings, including the custom-house, the new mint, and other government offices, and is lined by a splendid series of jetties for ocean steamers. Among other places of interest are the High Court, the Victoria Memorial Hall (opened 1921), the Bengal Government Offices, St Paul's Cathedral, the Scotch kirk (St Andrew's), the Imperial Museum, the town-hall, Bank of Bengal, Jesuits' College, Medical College, the General Hospital, university, the domed post-office, and the Treasury. Calcutta has three theatres, several large European hotels, several fine clubs—the Bengal and United Service, four daily English newspapers, and a number of monuments throughout the city, the most noticeable being those to the Marquis of Wellesley, Sir James Outram, and Sir David Ochterlony, the last a column 165 feet high.

Although the European quarter of the town is distinguished for its fine public buildings and commodious dwelling-houses, the quarters occupied by

the natives present a very different appearance, their houses being in most instances built of mud or bamboo and mats, and the streets narrow and unpaved. Great havoc was done here by the cyclone of 1864, which destroyed 40,700 native houses; and those of 1867 and 1870 were likewise very destructive. Considerable improvements have now been effected; new and wider streets have been opened through crowded quarters; brick houses are fast replacing the huts, and an extensive system of drainage has been carried out to the no small advantage of the inhabitants. A new municipal act was passed by the Bengal Council in 1899. The water-supply of Calcutta has been very much improved. Formerly the water was kept in large tanks, interspersed throughout the city, whence it was borne by water-carriers or *bhisties* in large leather bags. But since 1865 a supply of excellent water has been obtained from the Húgli, about 15 miles above Calcutta, where it is filtered and sent down by pipes in the usual way. Subsequent improvements now yield a daily supply

mills, and the great terminus of the East Indian Railway. The appearance of the city as it is approached by the river is very striking; on the left are the Botanical Gardens, destroyed by the cyclones of 1867 and 1870, but since replanted; and the Bishop's College, a handsome Gothic edifice, erected by the Society for the Propagation of the Gospel, and now used as an engineering college; on the right is the suburb of Garden Reach, with the palace in which the ex-king of Oudh resided from the time of the annexation of his territory till his death in 1887; farther on are the government dockyards and the arsenal; beyond these is the Maidan, which has been termed the Hyde Park of India, being the favourite place of resort of the *élite* of Calcutta for their evening drive. Here, near the river, lies Fort William, the largest fortress in India, constructed (1757-73) at a cost of £2,000,000, and occupying, with the outworks, an area of 2 sq. m. It is garrisoned by European and Indian infantry, with a battery of garrison artillery.

of some 36,000,000 gallons of filtered water, with an average consumption per head of 33 gallons a day in Calcutta and the neighbouring municipalities. The result of this and a system of underground drainage, with an outlet into the Salt Lake, has been a marked improvement in the health of the city. A pontoon bridge (1874) connects Calcutta with Howrah (q.v.) on the opposite side of the Húgli, which ranks as a separate city, and is the headquarters of the great jute and other manufacturing industries.

The communications of Calcutta afford great facilities for its extensive commerce. There are several lines of railway to various parts of India: the East Indian to Benares, Delhi, &c.; the Eastern Bengal to Goalundo; and the Bengal-Nagpur to Bombay. In the first years of the 20th century new official buildings were provided for the military administration and foreign affairs, and wide streets and hygienic spaces introduced into the native town; the new docks at Kidderpur

have given nearly 10 miles of quay frontage, and the navigation of the Hugli has been greatly improved. Work on a harbour extension scheme, to cost £3,750,000, was begun in 1920. The river, adjacent to the city, varies in breadth from a quarter of a mile to nearly a mile. Ships of 5000 tons ascend to Calcutta in the usual course, the main difficulty to shipping being the James and Mary shoal, half-way down the river.

The learned societies are mainly of European origin, but several have a considerable native membership. The principal bodies are the Bengal Asiatic Society, founded in 1784 by Sir W. Jones, possessing a fine library; the Dalhousie Institute, for the literary and social improvement of young tradesmen; the Public Health Society; the Microscopical Society; the Photographic Society. The university of Calcutta was founded in 1857 as an examining university. Facilities for research have been provided since 1893, and for teaching since 1909. A new scheme came into operation in 1917. Many colleges in Calcutta and elsewhere are affiliated to the university. Educational institutions are numerous in Calcutta. Among the principal are the Scottish Churches' College, the Martinière College, St Xavier's College, and the four government colleges—namely, the Presidency College, the Sanskrit College, the Madrasa or Mohammedan College, and the Bethune Girls' College. There are also a medical college, a school of art, and an engineering college; while in medical hospitals and charities Calcutta is as well endowed as any European city. The first Protestant missionary settled here in 1758, on the invitation of Clive. Calcutta was the birthplace of W. M. Thackeray.

Calcutta, reproached with being a city of palaces in front and of pig-sties behind, may be regarded as the great commercial centre of Asia. The sea-borne trade of the province of Bengal, including treasure, has a value of about £100,000,000 a year; and about 97 per cent. of this trade belongs to Calcutta. Of the total value of Indian produce exported in an average year, Calcutta was found to have contributed 15 per cent. in jute, 14 per cent. in grains and pulses, 13 per cent. in tea, 11 per cent. in oil-seeds, 7 per cent. in indigo, 7 per cent. in hides and skins, 4 per cent. in raw cotton, and 2 per cent. in raw and manufactured silk; while other exports, of which lac, saltpetre, and castor-oil are the most important, made up the balance. Calcutta exports enormous numbers of gunny-bags (in some years over 600 millions, worth over £11,000,000). Tea and wheat are among the most important exports. The port is annually entered by about 800 steamers, with an aggregate tonnage of some 1,500,000 tons. For other particulars as to the trade and manufactures, education, &c. of the capital, see the article BENGAL. See also INDIA, HUGLI, BLACK HOLE, CLIVE, HASTINGS, EAST INDIA COMPANY, and the articles on Bishops Heber and Cotton and on Dr Duff. As a great central depot for the richest parts of India, including the Ganges valley and Assam, Calcutta has an extensive inland trade. In an ordinary year the imports by rail, steamer, and country boat may amount to over £75,000,000, and the exports to £60,000,000. As a place of residence Calcutta is perhaps the pleasantest city in India, though by no means the most economical.

See C. R. Wilson, *Old Fort William in Bengal* (1906); Miss Blechenden, *Calcutta Past and Present* (1906); with the works of Yule, Wheeler, and Forrest.

Caldara da Caravaggio, POLIDORO, Italian painter, born at Caravaggio about 1492, was murdered by his servant at Messina in 1543. He aided Raphael in his Vatican frescoes. His 'Christ bearing the Cross' is in Naples.

Caldecott, RANDOLPH, artist, was born at

Chester on the 22d of March 1846, and was a clerk in a bank, first at Whitechurch (1861-67) and then at Manchester (1867-72). Having developed a great talent for art at an early age, he was encouraged by his success in the London illustrated papers to remove to the metropolis. His health, however, soon gave way, and, after vain attempts to restore it by trips abroad, he died at St Augustine, in Florida, on the 12th of February 1886. Randolph Caldecott was without an equal as the exponent of the humours of animal life and the joys of the country-house and hunting-field. He contributed frequently to *Punch* and the *Graphic*, and occasionally exhibited at the Royal Academy, the Dudley, and the Grosvenor Galleries. In 1882 he became a member of the Institute of Painters in Water-colours. Randolph Caldecott will chiefly be remembered by the admirable *Caldecott's Picture-books*, which began in 1878 with *John Gilpin* and *The House that Jack Built*. He also illustrated Washington Irving's *Old Christmas* (1875) and *Bracebridge Hall* (1877); Mrs Comyns Carr's *North Italian Folk* (1878); Blackburn's *Bretton Folk* (1880); and Mrs Ewing's *Daddy Darwin's Dovecote* and *Jackanapes* (1884). See his *Personal Memoir* by R. Blackburn (1886).

Calder, WEST, a small town of Midlothian, 16 miles WSW. of Edinburgh; pop. 2600.—**MID-CALDER**, 4½ miles nearer Edinburgh, has some 600 inhabitants; and **EAST CALDER**, close by, is a small village. The district has shale and coal mines and oil-works.

Caldera, a port of Chile, 38 miles WNW. of Copiapó, in a desert region, exports ores.

Calderon, PHILIP HERMOGENES, R.A., painter, born at Poitiers of Spanish parentage in 1833, studied in London and Paris, and regularly contributed to the Royal Academy from 1853, his subjects being chiefly historical or imaginative. He was elected an Associate in 1864, and an Academician in 1867. He exhibited at the Paris Exhibitions of 1867 and 1878, receiving at the former the first medal awarded to English art, at the latter a first-class medal and the Legion of Honour. In 1887 he was appointed keeper of the Royal Academy. He died April 30, 1898.

Calderon de la Barca, PEDRO, Spain's greatest dramatist, was born of a good old family at Madrid, 17th January 1600, and after four or five years' schooling under the Jesuits, from 1613 to 1619 studied law and philosophy at Salamanca. Already in 1614 he had perhaps written his first play; at the poetical contests of 1620 and 1622 he had won Lope de Vega's praises, when in 1625 he chose the profession of arms, and, during ten years' service in the Milanese and in Flanders, saw much of men and manners that he afterwards utilised. Nor meanwhile did he neglect the muse, but wrote many dramas which were much applauded; so that, on Lope's death in 1635, he was summoned by Philip IV. to Madrid, appointed a sort of master of the revels, and made, in 1637, a knight of the order of Santiago. In 1640 the rebellion in Catalonia roused him once more to take the field; but in 1651 he entered, like Lope, the priesthood, and in 1653 withdrew to the 'chantry of the new kings' at Toledo. Ten years went by, and he was recalled to court, to the resumption of his dramatic labours, receiving, with other preferments, the post of chaplain of honour to Philip, whose death, in 1665, deprived him of a generous Mæcenas. Yet still he continued to write for the court, the church, and the public theatres, till, on 25th May 1681, in the words of his friend, De Solis, 'he died, as they say the swan dies, singing.' His remains, already

translated from their first resting-place in 1841, in 1869 were finally laid in Spain's new pantheon, the former convent of St Francis in Madrid. A bronze statue of him was unveiled in 1880; and his bicentenary was celebrated with great splendour in the May of the following year.

Castilian and Catholic to the backbone, Calderon wrote for his contemporaries, his fellow-countrymen, his co-religionists, not for posterity or the outer world. Hence, though his plays still hold their own in Spain, to that outer world he must ever be caviare. It cannot rightly appreciate his perfect fidelity to the Spanish thought and manners of his age; his passion seems to it bombast, his nice points of honour fantastic, and his plots, with their matchless *coups de théâtre*, a very labyrinth for intricacy. This, though Schlegel pronounced him 'the fourth in a mighty quaternion, with Homer, Dante, and Shakespeare.' This, too, in spite of the many fine English versions of his masterpieces; and in spite of the verdict of a great English critic, that, 'though inferior to Shakespeare in knowledge of humanity and in power of developing his characters from within, to Aeschylus in solemn passion, to Sophocles in the structure of his plays and in statuesque power of grouping, to Goethe in metaphysical subtlety—yet in pure poetry Calderon is the equal of them all, and second to none of them as a master of stage effect.' His *autos sacramentales*, outdoor plays for the festival of Corpus Christi, number 72, and have been divided into seven classes—biblical, classical, ethical, and so forth; the finest of them is *El Divino Orfeo*. Of his regular dramas 118 are extant. There are the religious plays (such as the Faust-like *Mágico Prodigioso* and *El Purgatorio de San Patricio*); the historical (*El Principe Constante*—Prince Ferdinand of Portugal); and the philosophic (*La Vida es Sueño*). There are the 'cloak and sword' plays (*La Dama Duende*, 'The Fairy Lady'), and the dramas of passion (*El Médico de su Honra*, *El Pintor de su Deshonra*, and *El Mayor Mostruo los Zelos*, 'No monster like jealousy'). There are many others; but classification becomes tedious and difficult; and it is these eight plays, with a dozen more, that are best known to English readers through the renderings of one or more of the following translators: Shelley (a fine fragment from *The Magician*); Denis M'Carthy (10 plays, 1853-73); FitzGerald (8 plays, 1853 *et seq.*); Trench (2 plays, with essay, 1856; 2d ed. 1880).

In 1888 Mr Norman Maccoll edited the Spanish text of four of the important plays, with notes and introduction. The best edition of the *autos* is that of Apontes (6 vols. Madrid, 1759-60), and there is a good German translation of them by Lorinser (18 vols. 2d ed. 1882); the best editions of the plays are by Hartzenbusch (4 vols. Madrid, 1848-50), and Garcia Ramon (Madrid, 1882). See the German works of Schack (1846), Fr. Schmidt (1857), Fastenrath (1881-82), and Gunthier (1888); Ticknor's *Spanish Literature* (1849); Lasso de la Vega's *Estudio de las Obras de Calderon* (1881); and Miss Hasell's *Calderon* ('Foreign Classics Series,' 1879).

Calderwood, DAVID, an eminent Scottish divine and ecclesiastical historian, was born in 1575, it is thought at Dalkeith, and after studying at the university of Edinburgh, was in 1604 ordained minister of Crailing, Roxburghshire. Opposed to the designs of James VI for the establishment of Episcopacy, in 1617 he joined in a protest against a bill, then before the Scots parliament, for granting the power of framing new laws for the church to an ecclesiastical council appointed by the king, and in consequence he was summoned before the High Commission at St Andrews, committed to prison for contumacy, and then banished the kingdom. He retired to Holland, and in 1623 published there, under the anagrammatic

pseudonym of 'Edwardus Didoclavius,' his celebrated controversial work, *Altare Damascenum*, in which he rigorously examined the origin and authority of Episcopacy. After King James's death in 1625, he returned to Scotland, and for some years was engaged collecting all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the Reformation there to the death of James VI. In 1640 he became minister of Pencaitland, Haddingtonshire; and in 1643 was appointed one of the committee for drawing up the *Directory for Public Worship in Scotland*. He died at Jedburgh in 1650. From the original MS. of his *History of the Kirk of Scotland*, preserved in the British Museum, an edition was printed for the Wodrow Society (8 vols. Edin. 1842-45).

Caledonia, the name applied by the Romans to the country north of the Wall of Antoninus, which ran between the Firths of Forth and Clyde. First occurring in Lucan (1st century A.D.), it was probably, like *Britannia*, a Latin coinage from a native name—*Caludo*. The 'Caledonian Forest' (Lat. *Caledonius Saltus* or *Salva Caledonia*; Welsh *Coed Celyddon*; the *Kaledonios Drumos* of Ptolemy) was a thick wood of birch and hazel extending from the west of the district of Menteith to Dunkeld (Gaelic *Duncalden* or *Dunchallann*, 'town or stronghold of the Caledonians'). By Scott and others the name *Caledonia* has been poetically applied to the whole of Scotland. See Rhys's *Celtic Britain*, and article SCOTLAND.

Caledonian Canal, a chain of natural lakes united by artificial canals, running straight across the north of Scotland in a south-westerly line from the North Sea to the Atlantic, through Glenmore, or the Great Glen of Albin, in Inverness-shire, and touching Argyllshire at its southern extremity. The sea and fresh-water lochs in this line are the Moray Firth and Lochs Doelfour, Ness, Oich, Lochy, and Linnhe. The canal was formed to avoid the dangerous and tedious navigation of ships, especially coasting-vessels, round by the Pentland Firth, Cape Wrath, and the Hebrides; the distance between Kinnaird's Head and the Sound of Mull by this route being 500 miles, but by the canal only 250, with an average saving of 9½ days for sailing-vessels. From the head of the Moray Firth to that of Loch Linnhe, the length of the canal is 60½ miles, 37½ miles being through natural lochs or lakes, and 23 miles by artificial cuts. Each cut is 120 feet broad at surface, and 50 at bottom, and 17 deep. The highest part is Loch Oich, 105 feet above sea-level; and there are in all 28 locks. The practicability of this great work was first shown by James Watt's government survey in 1773; but it was not till 1803 that it was begun under Telford. The whole line was opened for ships in 1823; and after three years of repair, it was reopened in 1847, the total cost up to 1849 being £1,311,270. Ships of 500 to 600 tons can pass through the canal. The annual expenditure as a rule exceeds the income. It is used by fishing-boats and tourist-steamers. The scenery is romantic on both sides, and there are many objects of interest, such as Fort William, Ben Nevis, Inverlochy Castle, Tor Castle (the ancient seat of Cameron of Lochiel), Glen Spean, Glen Roy with its Parallel Roads, Fort Augustus with its monastery, the Falls of Foyers, and Inverness.

Calendar (from *Calends*), the mode of adjusting the natural divisions of time with respect to each other for the purposes of civil life. For the measurement of time, as for the measurement of any other magnitude, some standard must be adopted. The earliest standard interval was the day, marked out by the alternation of light and darkness, and determined by the rotation of the

earth on its axis. For longer periods, the lunar month, from new moon to new moon, an interval of about 29½ days, was the standard next fixed upon; and finally the recurrence of the seasons suggested the year. The duration of the year was determined in various ways by the nations of antiquity, one of the earliest ways being to make it include a certain number of lunar months. Twelve lunar months, giving a year of 354 days, were taken as a near approach to a course of the seasons. In process of time, however, it was discovered that with this rough approximation to the true value of a year the seasons did not correspond to the same months, and it was necessary, in order to prevent them gradually making the round of the whole year, to make some adjustment. For this purpose the Jews and the Greeks employed much the same expedients; they intercalated a month from time to time, the former 7 times in a cycle of 19 years, the latter 3 times in a cycle of 8. The Romans are said, and the statement is confirmed by what is known of their sacred rites and customs, to have had originally a year of 10 months, beginning with March and ending with December, which means 'tenth' period. Early in their history, however, they adopted, from their belief in the luck attendant on odd numbers, a lunar year of 355 days, and added two new months, January and February. But, like the Greeks, they were compelled, in order to accommodate their lunar year to the solar year, to make occasional intercalations. The making of these intercalations was in the hands of the pontiffs, who had sole charge of the calendar, and they used this power unscrupulously for the gratification of their friends or the annoyance of their enemies. They lengthened or curtailed the year, often in order that a magistrate or farmer of the taxes might enjoy a longer or shorter lease of office than was permitted by law, and without regard to the unsettlement of the seasons, and at the time when Julius Cæsar became dictator, the spring festivals occurred in the nominally summer months. To clear away all this confusion, Cæsar, with the help of Sosigenes, an Alexandrian astronomer, undertook a thorough reform of the calendar. He effected it by making the year now called 46 B.C., 'the year of confusion,' consist of 445 days, and the succeeding years of 365 days, with the exception of every fourth year, which was to consist of 366. This method of adjusting the days to the year is called the Julian calendar. The number of days in the months from January to December before Cæsar's time had been respectively 29, 28, 31, 29, 31, 29, 29, 31, 29, 29. These numbers Cæsar changed to 31 and 30 alternately, with the exception of February, which was to have 29 in ordinary years and 30 in leap-years. In honour of himself he also changed to July the name of the month which followed June. In the application of the Julian correction to the calendar the pontiffs again went wrong, by inserting the leap-years once in every three instead of every four years. This mistake of theirs continued till the year now called 8 B.C., when three leap-years too many had been reckoned, and Augustus ordained that there should be no leap-year for 12 years, which, according to the Roman way of counting, would make leap-year occur in 4 A.D. At the same time Augustus gave his own name to the month following July, added one day to it which he took away from February, and that there might not be three consecutive months of 31 days each, he made September, October, November, December consist of 30, 31, 30, 31 days, instead of 31, 30, 31, 30.

The Julian calendar assumes the length of the solar year to be 365½ days, whereas it is 11 minutes and a few seconds less. This annual

error, a small one doubtless, accumulated as years rolled on, and began to be fully recognised about the beginning of the 16th century. Some proposals, such as that of Stöffler in 1518 and of Pitatus of Verona in 1537, were made to rectify the error, but the matter was not taken up in earnest till 1577, by Pope Gregory XIII. As in 1582 the vernal equinox occurred at a date (11th March) 10 days earlier than it did at the time of the Council of Nice in 325 A.D., Gregory published a bull, dated 1st March 1582, annulling 10 days, so that what would have been reckoned the 5th October 1582 was to be reckoned the 15th October. In order also that the displacement might not recur, it was further ordained that three of the leap-years which occur in 400 years should be considered common years. The three leap-years selected to be reduced to common years were those which close the centuries (i.e. which end with 00) and are not divisible by 400. Thus, 1600 was leap year; 1700, 1800, and 1900 were common years; 2000 will be leap-year; 2100, 2200, 2300 common years; 2400 leap-year; and so on. This method of adjusting the days to the year is called the Gregorian calendar, or the new style. The new style was adopted exactly according to the mandate of the pope in Spain, Portugal, and part of Italy; in France and some of the provinces of the Low Countries it was adopted in the same year by calling the 10th of December the 20th, and the 15th of December the 25th; and by Continental Roman Catholics generally before the end of the 16th century. Most Protestants, however, were then too much inflamed against Roman Catholicism in all its relations to receive even a purely scientific improvement from such hands, and it was more than a century before they abandoned the old style. In England a bill to this effect was brought before parliament in 1585, but did not get beyond a second reading in the House of Lords; and it was not till 1751 that an act was passed (24 Geo. II.) 'for regulating the commencement of the year, and for correcting the calendar now in use.' It was then enacted that 11 days should be omitted after the 2d of September 1752, so that the ensuing day should be the 14th. The enactment was not carried out without provoking discontent among uneducated people, many of whom imagined that they were defrauded of the omitted days, and assailed unpopular statesmen with the cry, 'Give us back our 11 days.' The reason for the omission of the additional day is that according to the old style 1600 and 1700 were both considered leap-years; according to the new style 1700 was a common year. At present, since 1800 and 1900 were leap years by the old style, and common years by the new style there is a difference of 13 days between the styles. The same English act which introduced the new reckoning in 1752 shortened by nearly three months the year 1751. For it had been the practice to commence the year with the 25th of March, the Feast of the Annunciation, and the year 1751 so commenced, but the year 1752 and all subsequent years began with the 1st of January. Scotland had adopted that date for New Year's Day in 1600. In the national accounts of the United Kingdom, the financial year closely corresponds still with the old practice. The Orthodox states adopted the Gregorian calendar in 1916-23; the Orthodox churches in 1923; and Turkey in 1926.

In 1793 the National Convention of the first French republic decreed that the common era should be abolished in all civil affairs, and that a new era should commence from the foundation of the republic, 22d September 1792. The year was to be divided into 12 months of 30 days each, with 5 complementary days at the end, which were

to be celebrated as festivals, and were dedicated to Virtue, Genius, Labour, Opinion, Rewards. Every fourth or 'Olympic' year was to have a sixth complementary day to be called 'revolution day,' and every period of four years was to be called a Franciade. The first, second, and third centurial years—viz. 100, 200, 300 were to be common years, the fourth centurial year 400 was to be a leap-year, and this was to continue till the fortieth centurial year 4000, which was to be a common year. The months were to be divided into three parts of 10 days each, called decades. The year was always to begin on the day of the autumnal equinox. The following table is good for the years I, II, III, V, VI, VII :

Vendémiaire (Vintage)	Sept 22 to Oct. 21.
Brumaire (Foggy)	Oct 22 " Nov 20.
Frimaire (Sleety)	Nov. 21 " Dec. 20.
Nivose (Snowy)	Dec. 21 " Jan. 19.
Pluviose (Rainy)	Jan. 20 " Feb. 18.
Ventose (Windy)	Feb. 19 " Mar. 20.
Germinal (Budding)	Mar 21 " Apr. 19.
Floral (Flowering)	Apr 20 " May 19.
Primal (Pasture)	May 20 " June 18.
Messidor (Harvest)	June 19 " July 18.
Thermidor (Heat)	July 19 " Aug. 17.
Fructidor (Fruit)	Aug 18 " Sept. 16.

By Napoleon's command the Gregorian calendar was resumed on 1st January 1806.

In the Jewish calendar, whose reckoning counts the years downwards from the Creation, the year is luni-solar and may be ordinary or embolismic. An ordinary year has 12 months (354 days), an embolismic year 13 months (384 days). The names of the months are Tisri, Hesvan, Kislev, Tebet, Sebat, Adar (with Veadar in embolismic years), Nisan, Yiar, Sivan, Tamuz, Ab, Elul; the New Year (1st Tisri), which falls between 5th September and 5th October, fell in the Jewish year 5681 at sunset 12th September 1920.—Other information as to time-reckoning will be found at CHRONOLOGY. For the Ecclesiastical calendar, see EASTER, GOLDEN NUMBER, INDICTION, SAINTS; for the Positivist calendar, see POSITIVISM; for the Mohammedan, HEGIRA; see also DAY, MONTH, PERIOD, YEAR; Jas. C. Macdonald's *Chronologies and Calendars* (1897), and Hon. E. M. Plunkett's *Ancient Calendars and Constellations* (1903).

Calender. See DERVISH.

Calendering is the process of finishing the surface of linen, cotton, and other textile fabrics, as well as paper, by combined moisture, heat, and pressure. It is usually done by passing the fabric between cylinders pressed together with great force. The familiar domestic processes of starching and ironing afford the simplest illustrations of the object and result of calendering. The patent domestic mangle effects the same object as the flat iron, and is indeed a calender without the element of heat.

In Beetling (q.v.), the cloth is beaten in a way which produces a supple, leathery finish; but in calendering, the pressure is applied continuously across the whole width of the fabric, which stiffens it and gives it a smooth and solid finish.

Calenders are made with from 3 to 12 cylinders, usually called bowls, but the number of these does not commonly exceed six. There are always one or more of the bowls made of paper or cotton pressed into a solid mass by hydraulic apparatus. These have a hard yet considerably elastic surface, and are not liable to warp like wood. They require to be turned very accurately. The other bowls, where wood is not employed, are of steel, chilled cast-iron, or brass. One or more of the metal cylinders are made so that they can be heated with steam, gas, or electric heating.

Printed calicoes, after being starched, are usually smoothed by passing them between bowls or

cylinders of hardwood and one of brass under considerable pressure. This is called mangling. What is called the Swiss finish for cotton fabrics is done by a similar process in which greater pressure is employed, but it is termed calendering. In the simplest machine three bowls are used, two of paper or cotton, and one of polished iron. A still higher gloss or glaze is put upon cloth by a friction calender in which the metal roller is driven at a slightly greater speed than the paper ones. Either hot or cold calendering may be employed for these fabrics, which are usually damped previously.

Jute and strong linen cloth are subjected to heavy calendering, the pressure being applied to the cylinders either by levers or hydraulic power. One kind of hydraulic calender for these goods works under a total pressure of eighty-five tons.

Calenders are now used at most paper-mills for putting a smooth finish, or it may be a high glaze, upon paper. The annexed figure shows one with six bowls. The three bowls, P, P, P, are made of

compressed paper or cotton, and the other three, I, I, I, are of chilled cast-iron. The bowl, I, is heated with steam, and the care required in using this cylinder is shown by the fact that it must be turned on the inside as well as on the outside to insure a uniform temperature on the surface. This calender is 11 feet high, is driven by a steam-engine of 20 horse-power, and the maximum pressure applied does not exceed 10 tons. As the figure shows, the pressure is regulated by screws, S, and compound levers, L, one of each being attached to each of the two end frames. The arrows show the direction the paper takes over the cylinders.

Some calenders used for the swissing, or ordinary calendering, of calico have the same number of bowls as shown in the figure, but in them the paper and the metal ones are arranged alternately. Such calenders have the same arrangement of screws and compound levers. Machines similar in construction to the one above described, but with all the rollers of iron, and also called calenders, are used for rolling india-rubber into sheets for coats, shoes, &c.

Calends (Lat. *Kalendæ*), the first day of each Roman month, which was divided into *Calends*, *Nones*, and *Ides*. The Calends always fell upon the first of the month; in March, May, July, and October, the Nones on the 7th, and the Ides on the 15th; and in the remaining months, the Nones on the 5th, and the Ides on the 13th. The Calends meant originally the day on which the order of days was proclaimed; the Nones were so called from being the *ninth* day before the Ides, reckoning inclusively; and the Ides probably from an Etruscan verb signifying to divide, because they nearly halved the month. This threefold division also determined the reckoning of the days, which were not distinguished as with us by the ordinal numbers *first*, *second*, *third*, &c., but as follows: Those between the Calends and the Nones were termed *the days before the Nones*; those between the Nones and the Ides, *the days before the Ides*; and the remainder, *the days before the Calends* of the next month. Thus, the Ides of January happening on the 13th of that month, the next day would not be termed by a Latin writer the 14th, but *the 19th before the Calends of February*, reckoning inclusively—i.e. reckoning both 14th of January and 1st of February, and so on to the last, which was *pridie Calendas*. Augustus's favourite phrase, *Ad Kalendas Græcas*, became a proverbial equivalent for 'never.' The Greek calendar had no Calends.

Calen'dula. See MARIGOLD.

Calenture, an old term of Spanish origin for a temporary delirium or fever occurring on board ship in hot climates, probably due to exposure to the sun's rays, was revived in the Spanish American war and applied to Cuban fever.

Calepino, or DA CALEPIO, AMBROGIO (1435-1511), lexicographer, was born at Bergamo. He became an Augustinian monk, and spent his whole life in compiling a long famous polyglot dictionary (Reggio, 1502). The name Calepinus or Calepine came practically to mean a dictionary.

Cal'gary, a city of Alberta, on the Canadian Pacific Railway, 2262 miles W. of Montreal. It stands 3380 feet above sea-level, in a broad and level valley between the Bow and Elbow rivers, and is the trading centre for a wide stock-raising and agricultural district, with vast stores and varied manufactures. As a divisional centre on the Canadian Pacific Railway and seat of its western carshops it provides work for thousands of men. There was an oil-strike and boom in 1914. The city only dates from 1884, but by 1921 had a population of over 63,000. See ALBERTA.—There is a bay of this name on the north-west coast of the island of Mull in Scotland.

Calhoun, JOHN CALDWELL, Vice-president of the United States, was born in Abbeville district, South Carolina, on the 18th March 1782, of Scottish Presbyterian descent. Graduating at Yale, he became a successful lawyer, and, member of congress for his native state, was prominent as a supporter of the measures which led to the war of 1812-15 with Great Britain. In 1816 he supported a bill for establishing a protective tariff, and reported to congress a measure for the creation of a national bank. In 1817 he joined Monroe's cabinet as Secretary of War, and in 1819, at the request of congress, submitted a plan for an extensive system of internal improvements. His labours in the reorganisation of the war department were of extreme value to the country. He was vice-president of the United States under the presidency of John Q. Adams (1825-29), and under that of General Jackson from 1829 to 1832, when he resigned the office. He prepared the first draft of

the *South Carolina Exposition* of 1829, a document of 56 printed pages, which distinctly marks the commencement of a new stage in Mr Calhoun's career. In this paper he announced the doctrine that a state can nullify unconstitutional laws, the principal reason set forth for the proposed exercise of this alleged right being the differing interests of different sections of the country, free trade being regarded as highly advantageous to the more southern states, and a protective tariff being conceded to be no less desirable for other parts of the country. The breach in his personal friendship for President Jackson (1830) completely freed him from old party affiliations, and left him free for a new political career. His *Address to the People of South Carolina* (1831) set forth with great force his newly developed theory of state rights. The passage by South Carolina in 1832 of the nullification ordinance was the occasion of his resignation of the vice-presidency, and of his entering the United States senate. Mr Calhoun accepted the compromise tariff of 1833. The remainder of his political career was that of a leader of the states-rights movement, and a champion of the real or supposed interests of the slave-holding states. More clearly than almost any other man in the country he understood the radical differences then existing between the social and industrial systems of the northern and southern states, and foresaw the bloody consequences which might sooner or later result from those differences. He left the senate in 1843, and in the following year became Secretary of State under President Tyler, in which capacity he signed a treaty by which it was proposed that Texas should be annexed to the Union. In 1845 he resumed his place in the senate. He strenuously opposed the war of 1846-47 with Mexico. He died at Washington of pulmonary disease, combined with a cardiac affection, March 31, 1850. Mr Calhoun, though not a man of great learning, possessed high intellectual power, fine logical ability, enormous capacity for labour, keen political foresight, and strong will; and his personal integrity and moral purity were never called in question. The *Life of Calhoun*, by R. S. Jenkins (1851), contains most of the accessible details of his personal career. See also his collected works (6 vols. 1853-54), with a Life by R. K. Crallé, and H. von Holst's *John C. Calhoun* (1882). The latter book discusses the leading events of Calhoun's career as viewed from an anti-slavery standpoint. With Henry Clay and Daniel Webster he formed 'the great triumvirate' of American political leaders, which was not a triumvirate in the sense of a close political union, for the three great orators were never closely associated, and were often in antagonism. Mr Calhoun seriously regarded slavery as a blessing to all concerned with it; and the systematic defence of that institution was the main purpose of almost all his public acts during the later half of his life. Calhoun was tall and slender, with a deeply lined face. See also his *Correspondence*, edited by J. F. Jameson (1900).

Calí (SANTIAGO DE), a town of Colombia, on a tributary of the Rio Cauca, 3300 feet above the sea, 50 miles SE. of Buenaventura; pop. 45,000.

Caliban (apparently a bye-form of *Cannibal* or *Carib*) seems to have found his way into Shakespeare's *Tempest* directly or indirectly from Pigafetta's account, in his *Voyage of Magellan* (see MAGELLAN) of the cannibal Patagonians, huge monsters who raged like bulls, calling on Setebos.

Calibre, or CALIBRE, is a technical name for the diameter of the bore of a firearm, whether a piece of ordnance or a small-arm. If the weapon is rifled its calibre is measured, not from the bottom of the grooves, but from the smooth surface between

them, technically called the 'lands.' Ordnance firing solid shot were formerly denoted by the weight of each shot, as 24-pounder, 68-pounder, &c.; mortars and shell-guns by their calibre, as 13-inch mortar, 10-inch shell-gun, &c.; but now that all guns fire shell, this rule is not always observed. It has become usual to designate guns heavier than the 80-pounder, together with all howitzers and mortars, by their calibre, and lighter natures by the weight of the shell; but in every case the weight of the gun itself is also specified, as the 17.8-inch gun of 100 tons, the 80-pounder of 5 tons. Machine Guns (q.v.) and rifles are always classified by their calibres.

Calico-printing. At present this name is almost restricted to the art of imprinting coloured patterns on cotton cloth or calico. The production of coloured patterns on cloth is of great antiquity, and the art appears to have flourished for many centuries in China, India, Egypt, and Persia. One very old method, which is still used in Java under the name 'Battik' printing, consisted in applying the desired design to the cloth in wax and then dyeing the cloth. The parts covered with wax were protected from the action of the dye, and on removing the wax after dyeing, a white pattern was obtained on a coloured ground. In Europe, calico-printing first started in the counties bordering on the Mediterranean, and spread later to Holland and Germany; Augsburg, in the latter country, being celebrated for its printing in the 17th century. The first printworks in Great Britain appear to have been established at Richmond, Surrey, by a Frenchman about the year 1676. At the present date the chief seats of the industry are in Great Britain, France, Germany, Russia, Italy, Switzerland, Belgium, Holland, Japan, India, and the United States. Until the middle of the 18th century the designs were applied to the cloth by means of wooden blocks which were cut out by hand and used in the same manner as rubber stamps are to-day. A separate block had to be made for each colour in the design, and these were applied to the fabric in succession, so that the process was naturally a slow one. It is, however, still used for special purposes. The speed was increased by the 'perrotine,' which furnished the blocks with colour and applied them to the fabric automatically, but could only be used for three colours. The greatest improvement was the invention of the cylinder printing-machine by a Scotsman named Bell in 1875. This completely revolutionised the trade owing to the great increase in speed, and to the ease with which several colours could be printed at once. In recent years the main progress has been in the introduction of new colours and new methods of applying them.

In the cylinder printing-machine the designs are engraved on copper cylinders, which are supported in the printing-machine by an iron spindle or 'mandril.' A separate cylinder has to be used for each colour. There are numerous methods of engraving the patterns on the cylinders. In one method it is simply cut out by hand. In the 'pantograph' method, the carefully turned and polished cylinder is coated with varnish and placed in a special machine called a pantograph. In this machine the worker runs a pointer over the outline of an enlarged copy of the design, and by an arrangement of levers the motion of this pointer is transmitted to a number of diamond points, which scratch copies of the design, of the correct size, through the layer of coating-varnish. When this operation is completed the cylinder is placed in a bath of dilute nitric acid, which etches the copper at the places exposed by the scratches. The varnish is then cleaned off, and the engraving finished by hand. Very good results

are obtained by the 'mill and die' method. The pattern is cut on the die, which is a small cylinder of soft steel about an inch in diameter. This is then hardened and used to impress a reverse pattern on another cylinder called the 'mill,' which is then hardened and used to impress the design on the actual printing-cylinder by revolving the two cylinders in contact under high pressure. The use of copper rollers is a cause of great expense in printworks, and entails large capital.

Printing-machines.—The principle of a calico-printing machine will be understood by the annexed diagram (fig. 1),

which shows in cross section the arrangement of rollers and colour-boxes for producing a pattern in three colours. D is the large central drum, which is thickly cushioned with some soft material. Round this drum revolves an endless blanket, E, which serves to guide the calico, P. Each of the three engraved copper cylinders, B, B, B, prints a portion of the pattern. These are placed against the drum, over which the calico moves to receive the impression from them. W, W, W are wood rollers covered with cloth, and dip into colour-boxes, C, C, C, as they revolve, each imparting its colour to its own cylinder. Two long blades called the 'lint doctor' and the 'colour doctor' act upon these cylinders, the one removing loose fibre, the other superfluous colour. Fig. 2 gives a view of a complete machine for printing ten colours, the arrangements in it being much the same as for a smaller number. It shows that the iron mandrils which support the printing-cylinders rest in bearings on side frames, and that these cylinders revolve by toothed wheels working in the teeth of a large spur wheel. The small wheels are fixed on the iron mandrils, and there is a system of screws, levers, and weights for pressing the copper cylinders against the central drum. These cylinders require to be adjusted with mathematical precision in order to print accurately. When roller-printing was introduced, more than a hundred years ago, only one colour was printed at a time, the machines having but one printing-cylinder. Machines are now made to print as many as sixteen colours at one operation.

Duplex Printing.—If the cloth is to be printed on both sides a duplex machine is often employed. This consists of a machine fitted with two large printing-drums or 'bowls,' each with its own set of printing-rollers, &c. The bowls are usually mounted one above the other, and after being printed on one side in the lower part of the machine, the cloth passes up round the upper bowl, following an S-shaped course, and is printed on the other side on the upper bowl.

Thickenings.—In order to prevent the colour solutions from 'running' on the cloth, and to obtain sharp outlines, they must be suitably thickened. The thickenings chiefly in use are either starches of various kinds or starch products or else gums. The starches chiefly used are wheat, maize, and tapioca, and also their respective flours. The starch products include British gum, dextrine, &c. The gums include gum-arabic, gum-senegal, and gum-tragacanth, besides numerous others. The

Fig. 1.

starches are mixed to a paste with cold water, and then boiled in large jacketed copper pans fitted with stirring-gear. The gums are usually soaked in water and then boiled. In many cases the colours, &c., can be boiled up with the thickening, but in others the thickening must only be added when quite cold. The colours must be carefully strained before use to remove any lumps which might cause uneven printing, and also any gritty substances which might injure the printing-rollers. The colour pastes are usually strained by squeezing them by hand through fine cotton cloths. In the printing directions given below it is to be understood that the necessary thickening is added. It has been left out to save space.

The Printing Process.—Before printing, the cotton must be well bleached, especially for the

to the fastness of the colours, in order to clean the whites and to remove the thickenings. In some cases the pieces are given a treatment with a dilute bleaching solution in order to clean the whites better. After a final wash with water and drying, the pieces are ready for finishing for the market by starching, calendering, &c.

Dyestuffs.—The colouring matters employed in printing are, with few exceptions, the same as those used in cotton-dyeing, although their relative importance for these two purposes varies considerably. For practical purposes they may be divided into the following classes: (1) direct cotton dyes; (2) basic or tannin dyes; (3) acid dyes; (4) mordant dyes; (5) sulphur dyes; (6) vat dyes; (7) insoluble azo dyes; (8) aniline black and other oxidation dyes; (9) mineral dyes; (10) pigment colours. For a description of the above classes of dyes, see the article on Dyeing.

Mordants.—Many of the above dyes require the use of a mordant (see DYEING) in order to fix them in a satisfactory manner on cotton. The chief mordants employed in printing are Tannic Acid (q.v.) for the basic colours, and various compounds of aluminium, chromium, iron, and tin for the mordant colours proper. Besides the above, various fatty substances are employed in the fixing of some of the colours. The metallic mordants used in printing are usually acetates, and when cotton printed with them is steamed, acetic acid is split off and escapes as a gas with the steam, whilst the metal usually remains fixed on the cloth in the form of an insoluble basic salt, which can then combine with and fix the mordant dyestuff in the form of an insoluble colour lake. Acetates of alum and iron are known as red and black liquors respectively, being chiefly used in the production of red and black colours.

Printing Styles.—Most of the dyestuffs can be applied in printing by a number of different methods which are known as 'styles.' Suppose, for example, that a single coloured pattern is to be printed with a mordant dyestuff on a white ground. One method would be to print a suitable mixture, containing both the dye and the mordant, direct on to the cotton. A second method would be to mordant the whole surface of the cloth, and then to print on some substance which would remove or destroy the mordant at the printed places, and finally to dye the cloth with the necessary mordant dyestuff. Where the mordant had been 'discharged' the dye would not be fixed, so that a white pattern would be left on a coloured ground. A third method would be to print the mordant in the desired pattern, and then to dye the whole piece; whilst a fourth would be to mordant and dye the whole piece first, and then to print a 'discharge' which would destroy the dyed colour. Finally, some substance might be printed which would 'resist' the subsequent application of the mordant or dye. The first method is called the direct printing style, or, in cases where steaming is necessary, the steam style. The second would be the discharge style; whilst the third is known as the madder style, having been formerly much used with that dyestuff. The fourth is a simple discharge print; whilst the last would be a 'resist' style. The methods for applying the various classes of dyes according to the above styles will next be considered, but, for convenience, the

Fig. 2.

madder style, as any traces of impurity left in the cotton are liable to attract dyes or mordants from the various baths, and so cause dirty 'whites' (see BLEACHING). The cotton must also be singed, as any loose fluff would spoil the sharpness of the outlines. For some colours (see below) the cloth must be prepared with oil before printing. After printing, the cloth is usually dried either by hot air or else by passing it over heated copper cylinders, and then, in most cases, must undergo a steaming process in order to develop the proper colours and fix them on the cotton. The duration of the steaming varies from a few minutes to an hour or more, and the steam pressure used also varies with the particular colour from nothing up to 30 pounds or more to the square inch. For short steaming, the cloth is often passed over guiding-rollers through a small chamber called an 'ager.' This is heated with steam-pipes and steam is blown in. The cloth passes in through a narrow slit, travels up and down over the rollers, and finally emerges through the same or another slit. For longer steaming very large chambers on the same principle are used, or else the cloth is simply hung in closed cylinders called 'cottage steamers,' in which it is steamed under the desired pressure.

After steaming, some colours require a treatment with various chemicals in order to complete the fixation of the colour, and the pieces are then well washed with hot water or soap solutions, according

printing of the vat, insoluble azo, and oxidation dyes will be treated in separate paragraphs.

DIRECT PRINTING.—Direct cotton dyes are seldom used for direct printing, but, if required, are printed with a weak alkali—e.g. sodium phosphate, steamed lightly and finished without washing. *Tannin Dyes.*—Print with a colour containing the dye (dissolved usually in acetic acid), and also tannic acid; dry, steam, and pass through a solution of some antimony salt—e.g. tartar emetic—in order to fix the colour. *Mordant Dyes.*—The print colour contains the dyestuff and the necessary mordants; it is printed, dried, and steamed. In some cases the cloth must be first prepared with an oil mordant. *Acid Dyes.*—These are not much used, but are sometimes printed like mordant dyes. *Sulphur Dyes.*—These are printed with sodium hydrosulphite and caustic soda, and then steamed and oxidised. *Pigment Dyes.*—These are mainly of a mineral nature—e.g. vermilion, Prussian blue, &c. They are printed with albumen, and then steamed in order to coagulate the albumen and so fix them on the cotton mechanically. *Printing of Mordants.*—The cloth is printed with a suitably thickened solution of the required mordant, dried, aged, and dunged (see Madder Style, below).

DISCHARGE PRINTING.—This style is of great commercial importance and gives very good results. The cotton is usually first dyed the required ground-colour by one of the ordinary dyeing methods, and then a discharge is printed which destroys the dyed colour in the printed places. In some cases the cloth is first mordanted, and then the mordant is discharged in the required pattern, after which the piece is dyed as in the madder style (see below). As a general rule steaming is necessary after printing in order to complete the discharging action.

The various discharges employed may be divided into four main classes: (1) Oxidising discharges, which contain such substances as chlorates, prussiates, &c., and effect the discharging action by oxidation. (2) Reducing discharges, containing hydrosulphites, tin crystals, zinc-dust &c., and acting through their reducing properties. (3) Alkaline discharges, containing caustic soda, &c., and acting mainly through their solvent action on the dyes and mordants. (4) Acid discharges—e.g. citric acid; these are chiefly used for discharging metallic mordants by their solvent action. Coloured discharges are obtained by adding to the discharge pastes, dyes, or pigments which are not affected by the discharging process.

Direct cotton dyes are usually discharged with hydrosulphite; tannin dyes, by chlorates or other oxidising discharges; mordant dyes, sometimes by chlorates. Turkey-red, which is by far the most important member of this class, is discharged by the two following methods: (1) The dyed material is printed with citric acid or some other organic acid, dried, and passed through a solution of bleaching-powder. The acid decomposes the bleaching solution in contact with the printed places, and discharges the colour there by oxidation. (2) The dyed cloth is printed with a strongly alkaline colour, steamed, and washed. The colour is dissolved at the printed places. Sulphur dyes are discharged with chlorates. *Mordant Discharging:* (a) *Metallic Mordants.*—The cloth is padded with the mordant, dried, and an acid discharge printed; the material is then aged and dunged previous to dyeing. (b) *Tannin Mordants.*—The cloth is mordanted with tannin, dried, and printed with caustic soda, which removes the tannin in the printed portions.

RESIST PRINTING.—In resist printing the white material is printed with a colour which, when applied to the fibre, will prevent dyes or mordants from adhering to the resisted portions if the material be subsequently over printed or dyed. The resisting

effect may be due to chemical or mechanical action, or both, according to the particular process employed. *Tannin Dyes.*—Print a resist containing antimony or zinc salts, and overprint with a tannin steam colour. Where the resist is printed the tannin colour is only superficially fixed, and is removed by washing. *Mordant Dyes.*—These may be resisted by printing an acid colour (citric acid), and overprinting with a steam mordant colour. *Sulphur Dyes* may be resisted with zinc chloride.

As with discharge printing, coloured effects can be produced by the addition of suitable colours to the resist pastes. Inert substances—e.g. china-clay—are frequently added to the resist pastes in order to assist their action mechanically by forming an impervious layer on the cloth.

MADDER STYLE.—In this style the colour is applied by a dyeing operation, the mordant having been previously fixed on the fabric by printing. The mordant pattern may be prepared either by mordanting the whole piece and then printing a discharge, or else by printing the mordant direct. In either case, if the mordant used be a metallic acetate, an 'aging' process is necessary in order to fix it on the fibre. The mordant is aged by passing the pieces through moist chambers kept at a moderately hot temperature, in order to drive off the acetic acid and so fix the mordant. To remove any unfixed mordant which might bleed off and stain the 'whites,' the pieces are 'dunged' by passing them through a mixture of hot water and cow-dung, which appears to combine with any loose mordant and prevent it from settling on the 'whites.' Other substances—e.g. phosphate, arsenate, or silicate of soda—are sometimes used in place of cow-dung. The piece is then washed and dyed. Madder has been replaced by the artificially prepared alizarin. The following example will illustrate the process:

Fig. 3.

Suppose that a pattern in three colours is required, it can be produced in this way by using only madder or alizarin as the dye. Three mordants are employed in printing on the pattern. One of these is 'red liquor,' another is 'black or iron liquor,' and the third is a mixture of these two. A separate roller and colour-box (really, in this case, a mordant-box) is used for each of these in the printing-machine. When the cloth is printed, aged, dunged, and dyed, the result is that, with the same solution of alizarin, the alumina (red liquor) mor-

dant has produced a red, the iron mordant a purple, and the mixed mordant a chocolate colour. The accompanying woodcuts represent a pattern thus produced. Fig. 3, A, shows the chocolate portion from the first roller, B the purple portion from the second roller, C the red portion from the third roller, and D the complete pattern made up of all three colours. The impression from each roller is shown separately in these, but the full pattern is printed at one operation in the machine. If a design is required with each of these colours in two shades, then each mordant is prepared of two strengths, and six rollers are necessary to print the pattern, one dye-bath being used as before.

The dyeing consists in passing the mordanted calico through a solution of alizarin in a dye-beck or cistern heated by steam, over which is supported a winch, which serves to draw the cloth in a continuous manner through the dye until it is saturated with the colour. The operation of 'clearing' follows the dyeing, and this is effected by boiling the cloth in soap-and-water. Clearing removes any dye from the unmordanted portions of the calico, leaving the pattern sharp and distinct.

VAT DYES.—By far the most important member of this class is Indigo (q.v.); the others, which are mainly of recent introduction, are usually applied by similar methods to those used for indigo. Being insoluble in water, they require a special process to apply them to the fabric (see DYEING).

Direct Printing.—One of the chief methods depends on the fact that glucose, in presence of caustic soda, can reduce indigo to its soluble derivative, indigo-white. The cloth is padded with a solution of glucose, dried, and printed with a colour containing indigo and caustic soda. On steaming, the indigo is reduced to indigo-white, which dissolves in the soda and is absorbed by the cotton. The steamed pieces are then well washed with water in contact with air in order to oxidise the indigo-white back again to the insoluble indigo-blue, which remains fixed on the cotton. A newer method consists in printing a colour containing indigo, caustic soda, and hydrosulphite, followed by steaming, &c. This obviates the use of glucose.

Discharge Printing.—There are two main methods. (1) Print a chlorate colour on the dyed fabric, and then steam. (2) Print a chromate on the dyed cloth, and pass the latter through a bath containing sulphuric and oxalic acids in order to liberate chromic acid in the printed places and so destroy the dye by oxidation.

Resist Printing.—Print the dyed cloth with a paste or 'pulp' containing metallic salts, china-clay, fats, &c., so as to form an impervious layer on the printed portions, and then dye in the vat. On removing the resist by washing after dyeing, a white pattern is produced on a blue ground. If lead salts be added to the resist paste and the cloth be passed through a chrome solution after dyeing, a yellow pattern is produced by the formation of chrome-yellow at the printed places.

INSOLUBLE AZO DYES.—These require a special process (see DYEING). The following details relate to para red, the most important member of the class.

Direct Printing.—Pad the cloth in a caustic soda solution of beta naphthol, dry and print with a thickened diazo solution prepared from paranitraniline, and wash well. The red pattern is formed directly the diazo touches the prepared cloth.

Discharge Printing.—This is done with hydrosulphite in the usual manner.

Resist Printing.—Pad the cloth with naphthol solution, dry and print a resist containing tin crystals, dry and pass through the diazo solution of paranitraniline.

ANILINE BLACK (see DYEING).

Direct Printing.—Print a colour containing

aniline salt, sodium chlorate, and yellow prussiate, and steam. The colour is produced by the oxidation of the aniline during the steaming. A subsequent chrome-bath is advantageous. Aniline black cannot be discharged.

Resist Printing.—Pad the cotton in a solution containing aniline salt, chlorate of soda, and yellow prussiate; dry carefully, and print a resist of an alkaline or reducing character—e.g. acetate of soda or hydrosulphite. On steaming, the black is developed except in the resisted portions, which remain white.

Calico-wood, or SNOWDROP-TREE, a genus of American shrubs of the family Styracaceæ, with showy white drooping flowers.

Calicut, a seaport of Malabar, Madras Presidency, 6 miles N. of Beypur terminus, and 566 SSE. of Bombay. It was the first spot in India visited by Covilham (1486) and Vasco da Gama (1498), being then the chief emporium on the coast, with stately dwellings and magnificent pagodas. So populous and powerful was it that it twice repulsed the Portuguese, slaying their commander in 1509, and expelling Albuquerque himself, after a momentary success on his part, in 1510. In 1792, when it fell into the hands of the English, the city was little better than a ruin. Since then it has made considerable progress in trade and population, and is still a growing place. It is the headquarters of the Malabar district, and has a custom-house, salt depot, barracks; the anchorage is an open roadstead. The French have a factory here, founded in 1698. The Arabic spelling of the name is *Qaliquṭ*, mediæval Latin *Calicutia*. The cotton cloth at first exported hence was called 'calico' or 'kalyko' by the English, apparently through the French *calicot*. Pop. 82,000.

Calidarium. See BATHS.

Calidris. See SANDERLING.

Calif. See KHALIF.

California, the most important Pacific coast state of the American Union, bordering on Oregon, Nevada, Arizona, and the Mexican territory of Lower (or Old) California, is popularly known as the Golden State or, in the west, simply as 'the Coast'; the parallels of 32° 28' and 42° N. lat. mark its S. and N. limits. The name California was given by the Spanish discoverers to the peninsular or Mexican territory, being transferred by them from Montalvo's *Las Sergas de Esplandian* (a continuation of his *Amadis*, q.v., 1508), in which it occurs as the name of an island full of gold and precious stones. The state has an area of 158,297 sq. m., including 2645 sq. m. of water. It is thus larger than any other state or territory except Texas and Alaska. It is larger than Italy or Norway, and more than a fourth larger than Great Britain and Ireland.

The aspect of the country is extremely various, yet everywhere very different from that of the Atlantic and central states of the Union. Along the eastern border of the state, throughout the greater part of its length, extend the ranges of the Sierra Nevada (of which there is, however, in general, one main range), having a breadth of from 75 to 100 miles from east to west. In

the extreme north the Sierra Nevada narrows and falls off in height; but by a relatively low ridge it connects with the Cascade Range (q.v.), which is both geographically and geologically its northward extension. The scenery in this part of the state is generally attractive, and often (as in the wonderful Yosemite and Hetch-Hetchy valleys) it is very striking. There are ten peaks which exceed 10,000 feet in height; Mount Whitney (14,998 feet) being higher than any other in the United States outside of Alaska. Several peaks have perpetual snow on their crests, and some small glaciers exist in the range. West of the Sierra Nevada lies the central valley of California, drained by the Sacramento River from the north, and the San Joaquin from the south, the two rivers having a common delta, and discharging their waters into the bay of San Francisco, through a shallow expanse called Suisun Bay. The eastern slope of the great valley is very gradual, while the opposite side of the Sierras has a sharp and precipitous descent towards the great basin of Nevada. The Coast Mountains do not form any very clearly defined range, but consist of a number of ill-defined ridges. In the north they are blended with the mountains of the eastern system; but to the north of the state limits the two systems again separate. To the south of the San Joaquin Valley a transverse ridge connects the coast-ranges with the Sierra, or its southern extension, separating to some extent Southern California from the rest of the state. This southern region occupies nearly one-fourth of the area of the state. Geologically, the coast-ranges are in general of much more recent date than the Sierra proper. The coast-line is mostly high and rocky, with only a few bays and harbours.

Extending more than 700 miles from north to south, and having great variations in respect of height, California presents a great variety of climatic conditions. In the north-west the rainfall is excessive, and in the north the winters are rather severe than mild; the coast region of the northern half of the state is damp, with cool or cold nights, even in summer. But Southern California, in temperature and productions, has a semi-tropical character; and the serenity of its climate has made it famous as a winter-resort and as a place of residence for invalids. In the south the scanty rainfall and the extreme summer heat detract from an otherwise perfect climate. In general it may be said that the winters in California are mild, and the summers dry, and not intensely hot, though often very dusty. There are practically but two seasons—a more or less rainy winter, and a nearly rainless summer. Extremes of temperature are much less marked than in the states east of the Rocky Mountains. The mean temperature in winter at Humboldt Bay is 43° 5', in summer 57° 5'; at Fort Yuma the winter mean is 57°, while the summer mean is 90°. In the interior the thermometer sometimes reaches 120° in summer.

Besides the San Joaquin and Sacramento and their tributaries, the principal rivers are the Rio Colorado, which forms the boundary between this state and Arizona; the Klamath River and its tributary the Trinity; the Mad, Smith, Eel, and other rivers, mostly small and flowing to the Pacific. Some of the interior streams flow to lakes and 'sinks' with no outlet to the sea. The principal lakes are Tulare Lake, which at high-water pours its surplus into the San Joaquin River; Clear Lake, noted for its beauty; Lakes Klamath and Rhett (or Tule) on the Oregon boundary; the great lakes of Modoc county, which have no outlets; the high mountain lake Tahoe, noted for its fine scenery; and the strongly alkaline and saline Mono and Owens lakes, which occupy ancient craters. Some of the dried-up lakes of the south-east have left basins lower than the sea-level.

The geology of the state presents some difficult problems, though its general features are simple. It would appear that a large part of the rock-formation was deposited by extinct rivers flowing seaward during the Paleozoic era, throughout a great part of which time the ocean seems to have washed the western shores of the Rocky Mountain chain. The Sierra Nevada is to a great extent an upheaval dating from about the end of the Jurassic period. To the northward there are abundant evidences of much more recent volcanic action, such as the great lava beds of the north-east; and earthquakes, usually slight, are still frequent. The Sierra Nevadas in their turn suffered great denudation, and the wash from their sides forming an off-shore deposit, was at length slowly upheaved into the coast mountains. They may be assumed to date from near the end of the Miocene period. The richest finds of gold have been in detached Jurassic and Triassic fields along the slope of the Sierras, or at their base. The gold production of the state, at one time enormous, greatly declined. In 1848-64 the annual production was \$56,000,000; in 1892 it was only \$12,000,000. It has since revived; in the five years to 1901 it averaged over \$15,000,000 annually, and in 1920 it was \$14,311,043. The ores at present worked are chiefly the abundant low-grade and lean ores, such as, if worked by the processes which prevailed a few years ago, would not afford a fair profit. Three-fourths of the annual product in bullion is now obtained from quartz; the rest mainly by hydraulic and drift mining. Quick-silver, lead, and silver ore are also largely obtained. Among the valuable minerals obtainable are borax, rock-salt, marbles, asphalt, potash-salts, native soda, sulphur, kaolin, and many others. California in 1920 produced 103,377,361 barrels of petroleum, valued at \$178,394,937. Natural gas, suitable for fuel, is reported to be found at various points. The coals of California are low-grade lignites, and are not extensively wrought. Copper, iron, chromium, antimony, and other metals abound.

But the metallic and mineral wealth of the state is not more remarkable than the range and magnitude of its agricultural resources. Wheat and barley are the most important and abundant cereals. Oats do well, and maize grows in certain districts. The ordinary root-crops and garden vegetables flourish well, except potatoes, which, however, do well locally. Alfalfa, or lucerne, is a leading forage-crop. Experiments have shown that cotton, sugarcane, and rice can be grown in the interior valley, and beet-sugar also. Nearly all the valuable fruits of the temperate zone flourish admirably, as well as the orange, lemon, fig, olive, almond, and pomegranate. Vast amounts of dried and otherwise preserved fruits are exported. The culture of semi-tropical fruits has latterly had a great extension in the central valley. The European grape-vine thrives finely here, and in general culture it replaces the native American species. The raisins of California are of high excellence and are abundantly produced; brandy and wine are of course no longer made. The breeding of sheep and cattle is extensively carried on, wool especially being a staple product. Silk-growing is conducted on a moderate scale. Bee-keeping is a pursuit of great importance, some of the honey-farms ranking among the largest in the world. Dairy-farming is locally important. In the arid sections of the south extensive systems of irrigation have been put in operation. Irrigation is carried on by the network of flumes or ditches left by the placer system of mining for gold, as also by pumping and by artesian wells sunk through the dry and porous alluvial soil to the gravel beneath.

The native flora of California is very distinct from that of the country east of the Rocky Moun-

tains. Mention should be made of the 'big trees' (*Sequoia gigantea*; in Britain commonly known as *Wellingtonia*), noteworthy for their enormous size; also of the valuable redwood (*Sequoia sempervirens*), which forms extensive forests in the north. The country has a large number of interesting native shrubs and flowering plants. Several species of Eucalyptus and of other Australian trees have been introduced, and thrive remarkably. In the extreme south palm-trees and other subtropical plants locally occur. The forests, especially to the north, afford great amounts of timber, and the manufacture and shipment of lumber constitute an important industrial feature. (The leading branches of manufacture are petroleum-refining, the drying and preserving of fruits, the packing of meats, wood and metal industries. Many other manufacturing interests are in course of development. California blankets have a wide reputation for excellence. The fisheries are large and of growing importance. A considerable proportion of the product of the Alaska fisheries is marketed by way of San Francisco, and the ocean traffic of the state is chiefly centred at that port. The principal exports are wheat, barley, wool, honey, hops, timber, provisions, metals, ores, borax, and other minerals; fish and furs, largely from Alaska; dried, preserved, and green fruits, including oranges, prunes, raisins, and almonds. In 1900 California ranked among the five great wheat-growing states; but it now ranks low. There are 10,000 miles of steam railways in the state, besides 3500 miles of electric urban and inter-urban lines.

The university of California is at Berkeley. The Lick Observatory, with its famous Telescope (q.v.), belongs to the state university, but is at Mount Hamilton, 50 miles south of San Francisco. The Leland Stanford University is at Palo Alto (q.v.). Pop. (1850) 92,597; (1860) 379,994; (1870) 560,247; (1880) 864,694; (1900) 1,485,053; (1910) 2,377,649; (1920) 3,426,861, including about 160,000 coloured persons, Indians, Chinese, and Japanese. The immigration of Chinese (in the proportion of twelve males to one female) attained an enormous maximum in 1882, but later has been almost wholly stopped by restrictive legislation. Landholding by Japanese was restricted in 1913.

The principal cities and towns are San Francisco (q.v.); Los Angeles, the metropolis of Southern California, and largest city on the Pacific slope of North America; San Diego, in the extreme south, which has the only commodious harbour in the state, excepting that of San Francisco; Oakland, Alameda, and Berkeley, which may be considered suburbs of San Francisco; Bakersfield and Fresno, in the south part of the central valley; Sacramento, the capital of the state; San Bernardino, in the south; Stockton, near the centre; San Buenaventura, Santa Cruz, and Santa Barbara, on the coast; San Jose and Monterey, each formerly the state capital; Pasadena, Long Beach, Vallejo, Riverside, Richmond, Santa Ana, Santa Monica.

History.—The peninsular (and still Mexican) territory of Old California was visited by Spaniards as early as 1534; and Cortez himself is believed to have surveyed the Gulf of California in 1536. Sir Francis Drake visited the coast in 1578. The early missions of what is now the state of California were under Franciscan control, and for many years thrived wonderfully. With the rest of Mexico, California became independent of Spain in 1822. This region was chiefly important for its export of hides and skins until after the war of 1847 between the United States and Mexico, one of the results of which was the transfer of Upper California (vastly more extensive than the present state) to the flag of the United States. The discovery of gold in 1848 was followed by an enormous excitement and

an inrush of gold-seekers. California was admitted to the Union in 1850. The administrative organisation was too weak to keep in order the wild lawless spirits who abounded amongst the new comers. Crimes of violence were frequent and were apt to go unpunished. Lynch Law (q.v.) became inevitable, and was had recourse to; soon after 1851, vigilance committees were established in the chief towns, and arrested, summarily tried, and hanged convicted thieves and murderers. Gradually a more regularly ordered state of things was established, and the development of the country has since been rapid. In April 1906 a disastrous earthquake, followed by extensive fires, destroyed the greater portion of San Francisco and parts of several other cities.

See SAN FRANCISCO, YOSEMITE; histories of California by Capron (1854), Hittell (1886), Royce (1886), Soulé, H. H. Bancroft, Atherton (1914), Eldridge (1915), C. E. Chapman (1926), and other works on the state by Cronise (1878), Nordhoff (1882), Austin (1914), James (1914), Johnson (1915), Chase (1919).

California. LOWER or OLD, is a peninsula and a territory of Mexico, continuous southward from the state of California, and is detached by the Gulf of California and the lower reaches of the Rio Colorado from the rest of Mexico. Its reported area is 61,562 sq. m., or more than half the extent of Great Britain and Ireland. The climate is exceedingly dry, and excepting in some of the valleys, agriculture is hardly practicable. The surface of the country is mostly covered with mountains, often rough and broken, but nowhere very high. The whale-fishery on the west coast, and the pearl-fishery of the gulf, are of some value. Mining enterprises have been undertaken at various points, with but moderate success at the best. Since 1880 over 400 mines have been reported as being wrought. Salt is obtained from the Gulf Coast, and chiefly from Carmen Island, and orchil is brought from the dry interior. Sugar is produced in a rude way in some of the fertile valleys. The vintage of El Patroncio is highly esteemed. The capital is La Paz, on one of the bays of the gulf. Pop. of territory, 52,200.

THE GULF OF CALIFORNIA, an arm of the Pacific Ocean, which divides the peninsula above described from the rest of Mexico, was originally known as the Sea of Cortez, by whom it was explored. It is 700 miles in length, and varies in width from 40 to 100 miles. At its northern extremity, where it receives the Colorado, it almost touches the territory of the United States.

Caligula. CAIUS CÆSAR AUGUSTUS GERMANICUS, Roman emperor (37–41 A.D.), the youngest son of Germanicus and Agrippina, was born August 31, 12 A.D., at Antium, and was educated in the camp, where the soldiers gave him the nickname Caligula, from the soldier's boots (*caligæ*) which he wore. He ingratiated himself with Tiberius, and on the death of the latter (37 A.D.)—an event which there can be little doubt was either caused or accelerated by him—it was found that he had been appointed co-heir along with the emperor's grandson; but the senate conferred imperial power on Caligula alone. In the beginning of his reign he appeared little likely to fulfil the threat of Tiberius, who had talked of educating him 'for the destruction of the Roman people.' He was to appearance lavishly generous and merciful, pardoning even those who had been the instruments of cruelty against his own family. But this ostentatious magnanimity was itself a disease, an unwholesome affectation, and co-existed with the most savage voluptuousness and lust. Consequently, when illness, the result of his vicious life, had weakened his faculties, the lower qualities of his nature obtained the complete mastery. In

addition to the senseless prodigality with which he commenced his career, expending in one year the enormous wealth left by Tiberius (£5,625,000), he began to manifest the most barbarous propensities. He banished or murdered his relatives, excepting his uncle Claudius and sister Drusilla (with whom he carried on incestuous intercourse); filled Rome with executions, confiscating the estates of his victims; amused himself while dining by having victims tortured and slain in his presence; and uttered the hideous wish that all the Roman people had but one neck, that he might strike it off at a blow! To vie with Xerxes, he constructed a bridge of ships between Baiæ and Puteoli (three miles across), upon which he built houses, and celebrated the exploit by a costly banquet on the middle of the bridge, concluding the entertainment by throwing a great number of his guests into the sea. His favourite horse he made a member of the college of priests, and afterwards raised to the consulship. Finally, he declared himself a god, and had temples erected and sacrifices offered to himself. To gratify his insane desires he shrank from no infamy; he robbed, plundered, and taxed his subjects to a degree which seems almost incredible; and when even these means proved insufficient, he established a brothel in his own palace, and sent out his slaves to solicit the public patronage for it. At length a conspiracy was formed against him, and four months after his return from a plundering expedition into Gaul, he was assassinated 24th January 41 A.D. Doubtless he had long been insane.

Caliph. See KHALIF.

Calippic Cycle. See CHRONOLOGY.

Calisaya Bark. See CINCHONA.

Calisthenics, or **CALLISTHENICS** (Gr. *kalos*, 'beautiful,' and *sthenos*, 'strength'), is a name for exercises for promoting gracefulness and strength, and comprises the more gentle forms of gymnastics, especially for girls.

Calixtines were the more moderate section of the *Hussites*, or followers of John Huss. They took their name from their contending for the giving of the cup (Lat. *calix*) in communion to the laity. For their history, see HUSS.

Calixtus, the name of three popes: **CALIXTUS I.** (properly *Callistus*), Bishop of Rome under Heliogabalus and Alexander Severus. According to Hippolytus, his bitter opponent, he was originally a slave, and had twice undergone severe punishment for his crimes before he became a priest under Zephyrinus, whom he succeeded, and who, while Calixtus was yet a deacon, gave him the charge of the *Cemeterium* on the Appian Way which has ever since borne his name. He was vigorously attacked by Hippolytus (q.v.) for his Patristian views and the laxity of his discipline. —**CALIXTUS II.**, formerly Guido, Archbishop of Vienne, was elected pope at Clugny 2d February 1119. In 1121 he overcame the antipope Burdinus (Gregory VIII.), who was supported by the emperor Henry V., and in 1122 concluded with the emperor the concordat of Worms, which settled the Investiture Controversy. He died on the 13th or 14th of December 1124. —**CALIXTUS III.**, formerly Alfonso de Borja (Ital. *Borgia*), born at Jativa, near Valencia in Spain, was successively counsellor to Alfonso V. of Aragon, Bishop of Valencia, cardinal, and (from April 8, 1455) pope. He laboured in vain to organise a crusade against the Turks, raised to the cardinalate his nephew, Rodrigo Borgia (afterwards Pope Alexander VI.), and died August 6, 1458 (see ALEXANDER VI.). —The name Calixtus III. was also assumed by an antipope whom the emperor Frederick Barbarossa

set up in 1168 in opposition to Alexander III., and supported for nine years.

Calixtus, **GEORG** (properly *Callisen*), an eminent theologian of the Lutheran Church, born 14th December 1586, at Medelbye in Sleswick, studied philosophy and theology at Helmstedt from 1603 to 1609, and, after travelling for four years in Germany, Belgium, England, and France, became professor of theology in that university in 1614. His genius, the depth of his knowledge, and the large experience of the world and of men which he had acquired in his travels, developed in him a spirit of great tolerance towards all who held their religious opinions honestly, whatever these might be. Although acknowledged by learned Catholics to be one of the ablest of their opponents, he was, on account of some statements in his work *De Præcipuis Religionis Christianæ Capitibus* (1613) which seemed favourable to Catholic dogmas, and of others in his *Epitome Theologiæ Moralæ* (1634) and *De Tolerantia Reformatorum* (1658) which approached too near to the Reformed or Calvinistic standpoint, declared guilty of abominable heresy by the orthodox and dogmatically rigid Lutherans. Calixtus felt keenly that the polemical harshness of Lutheranism was a serious obstacle in the way of a great Catholic Christianity, and that Protestantism must assume another form before it could hope to become the religion of Europe. Under this conviction, Calixtus endeavoured to show that the oldest and most fundamental articles of the Christian faith—viz. the facts embodied in the 'Apostles' Creed'—were common to all Christian sects. Having stated in subsequent dissertations that the doctrine of the Trinity was less distinctly taught in the Old than in the New Testament, and that good works were necessary to salvation; and finally, at the religious conference of Thorn, in 1645, as having been more intimate with the Calvinistic than the Lutheran theologians, he was accused not merely, as heretofore, of blameworthy compromise or 'syncretism,' but of apostasy. Fortunately his friends stood firmly by him, and he retained his professorial chair till his death in 1656. See Henke's monograph (1853-60) and the article in Heizog (1897).

Calkin, **JAMES**, composer, was born in London in 1786, was organist for thirty years to the Regent Square Church, and died in London in 1862. He composed a symphony, an overture, string quartets, pianoforte music, and madrigals.

Calla, an aquatic or marsh-loving genus of *Araceæ* (q.v.), with beautiful white spathes, cordate leaves, flowers crowded up to the extremity of the spadix, and red berries. *Calla palustris* is widely distributed through the marshes of palæarctic and nearctic regions, and acquires some economic importance in Lapland and parts of Russia (Vitebsk) from the fact that its root-stock, like that of so many other members of the same order, is a wholesome source of starch

Calla palustris.

matter, used in bread-making, after its acrid and poisonous properties have been removed by washing and cooking. The well-known and beautiful *Richardia æthiopica*, often popularly called 'Lily of the Nile,' was formerly included in this genus, and is often still called Calla.

Callander, a Perthshire village on the left bank of the Teith, 16 miles NW. of Stirling by rail. It lies in a beautiful and romantic situation described in Scott's *Lady of the Lake*, and is surrounded by high mountains and Highland lakes. Hence it is much frequented by tourists, who make it a centre to visit Loch Lubnaig, Ben-Ledi, the Trossachs, and Loch Katrine. Pop. (police burgh) 2000.

Callao, chief port of Peru, lies 7 miles SW. of Lima by rail, on a small bay. The streets generally are narrow and the buildings unimportant. In 1914 plans were ready for making large new deep-water docks, in which one million tons of merchandise can be handled annually. Operations were, however, delayed till after the War. The spacious roadstead, sheltered by the island of San Lorenzo, is one of the safest in the world. The huge old Spanish fortress is used for custom-house offices. There are sugar-refineries, ironworks, and sawmills; but the place depends chiefly for its prosperity on its trade. The exports are wool, sugar, specie, copper, cotton, bark, hides, guano, and cubic nitre. Population, 53,000. The present Callao dates only from 1746, when the original city, a short distance to the south, was destroyed by an earthquake and an invasion of the sea. Callao was bombarded in 1880 during the war between Chile and Peru, and the annexation by the former of the guano-producing islands materially decreased the exports of this manure; cubic nitre (a government monopoly) and wool come next in importance. By the completion of a direct cable between this port and Mollendo, telegraphic communication was established with the United States.

Callcott, JOHN WALL, composer, was born at Kensington in 1766, and abandoning medicine for music, in 1785 was made Bachelor, in 1800 Doctor, of Music at Oxford. In 1806 he published his *Musical Grammar*; the year after, his mind gave way. He recovered in 1812, but only for four years, when he relapsed, and continued insane till his death near Bristol, 15th May 1821. He was one of the most eminent composers belonging to the British school of music, and especially celebrated for his glees. The best of these were published in 1824, with a memoir by his son-in-law, W. Horsley. —His brother, SIR AUGUSTUS WALL CALLCOTT, landscape-painter, was born at Kensington in 1779, and for six years was a chorister at Westminster. In 1799 he exhibited a portrait at the Academy, and from 1804 devoted himself to landscape-painting. He became an A.R.A. in 1806, an R.A. in 1810, was knighted in 1837, and died 25th November 1844. His landscapes are remarkable for their beauty, clear definition of objects, good drawing, and truthful natural colouring. See Dafforne's *Pictures by Callcott* (1875). His wife, Lady Maria Callcott (1785–1842), was author of *Little Arthur's History of England*, and fourteen less-known works.

Callernish, a district on the west coast of the island of Lewis, 16 miles from Stornoway, remark-

able for its stone circles. There are seven at no great distance from one another, but without any visible relation. The principal one, of which the figure gives a bird's-eye view, is of a more than

Callernish Circle.

usually elaborate design. Two lines of upright stones run parallel to each other in a northerly direction, while a single line of similar stones is projected from the south, east, and west points, thus giving a cruciform figure to the structure, whose extreme dimensions are 408 by 130 feet. A larger stone than any of the others, being 17 feet high, and $5\frac{1}{2}$ feet broad at the base, occupies the centre of the circle, which circle is 42 feet in diameter. The stones themselves are not columnar or shaped into any form; they are simply broad, flat blocks of gneiss—the all-prevailing rock from the Butt of Lewis to Barra Head. There are 13 stones in the circle, including the centre one, 19 in the avenue, 4 in each of the east and west, and 5 in the south arm. The peat, which in the lapse of centuries had accumulated around the base of the stones to a depth of 5 feet, was removed in 1853, when a small chambered cairn was discovered within the circle. See Dr Joseph Anderson's *Scotland in Pagan Times* (1886).

Callichthys (Gr. *kalos*, 'beautiful'; *ichthys*, 'a fish'), a genus of physostomatous bony fishes of the family Siluridae (q.v.), having the body almost entirely covered by four rows of large, hard, narrow, scaly plates. The head is also protected by bony plates. The mouth is small; the teeth are very minute or even absent; two long barbules hang from each angle of the mouth. The twelve species of this fresh-water genus are natives of South America. When the streams or pools which they inhabit dry up, they are said to make their way across the land to some other piece of water. They may also bury themselves in the mud of wet meadows, out of which they are dug. A still more interesting habit is that of making regular nests, generally of leaves, in which they deposit their eggs, near the margin of the water, at the beginning of the rainy season. The male and female unite in watching the nests until the young are hatched. These habits are shared by the species of the allied genus *Doras*, in which the lateral plates are broader, keeled, and spiny.

Calligonum, a genus of leafless Polygonaceæ (q.v. for *C. leucocladium*), with large four-winged nuts or achenes. *C. Pallasia* is a succulent shrub common on sandy steppes near the Caspian, where its acid shoots and fruits often serve to allay thirst. Its root yields a nutritious gum.

Callimachus, an eminent poet, grammarian, and critic of the Alexandrian period, flourished about the middle of the 3d century B.C. He was born of a distinguished family at Cyrene in Libya; taught grammar and belles-lettres in Alexandria; was a favourite of Ptolemy Philadelphus, and his successor, Ptolemy Euergetes; and was made prin-

cipal librarian of the Alexandrian Library. He is said to have written as many as eight hundred works on the most varied subjects, but of these only fragments are extant. His elegies were much admired by Catullus, Propertius, and Ovid. The remains we possess are enough to show that art and learning, rather than genius, characterised his poetry. Of the two largest of his lost poems, *Aitia*, in four books, on the origin of mythical stories, and an epic *Hekale*, considerable fragments have been discovered in recent times, which show him to have had no little skill as a narrator of legends and a realistic word-painter. There are editions of his remains by Schneider (2 vols. 1870-73) and Mair (1921, with translation); of the Hymns and Epigrams, by Meineke (1861) and Willamowitz-Möllandorf (1897). For fragments discovered later, see the *Oxyrhynchus Papyri*.

Calling the Diet. See ARRANGEMENT.

Callionymus. See DRAGONET.

Calliopē ('the sweet-voiced'), the muse of epic poetry and of knowledge in general. She was the mother of Orpheus. See MUSES.

Callirrhoe, daughter of Achelous and wife of Alcmæon (q.v.).

Callisthenes of OLYNTHUS, a kinsman and pupil of Aristotle, devoted himself to the study of natural and political history, and accompanied Alexander the Great in his expedition to India. His bold outspoken ways, and his especial displeasure at the adoption of oriental habits and the intended assumption of divine honours, brought him under the king's displeasure, and led to his being put to death on a pretended charge of treason, 328 B.C. Only a few fragments of his historic works remain, and these are not valuable. The *History of Alexander* ascribed to him is evidently a production of the 2d or 3d century A.D., and much more romance than history. See ALEXANDER.

Callistratus, an Athenian orator, whose eloquence is said to have fired the imagination of the youthful Demosthenes. For his Spartan sympathies he was condemned to death by the Athenians in 361 B.C., and on his return from exile in Macedonia, was actually executed. Another Callistratus was a grammarian and critic.

Callistus. See CALIXTUS, HIPPOLYTUS.

Callitrichaceæ. See STARWORT (WATER).

Callot, JACQUES, engraver, was born at Nancy in 1594, and early devoted himself to art in opposition to his father's wishes. A boy of twelve, he attached himself to a band of Gypsies, and wandered with them to Florence; thence a gentleman sent him on to Rome, where, however, some Nancy merchants recognised him, and induced him to return home. He twice revisited Italy, and the second time (about 1612) became Thomassin's pupil at Rome in drawing and engraving; afterwards he repaired to Florence, where, by numerous spirited etchings, he gained great fame, and engraved for Cosmo II., Grand-duke of Tuscany, a series of plates of court festivals, &c. On his patron's death (1621), Callot returned to Nancy, there to be favourably received by the Duke of Lorraine, and to increase his reputation by a copious series of etchings, including six plates of the siege of Breda. For Louis XIII., who invited him to Paris, he executed etchings of the siege of Rochelle; but he refused to commemorate the capture of his native town, and, declining a pension offered by the king, returned to Nancy, where he died, 28th March 1635. His activity as an artist was marvellous. His realistic engravings, some 1600 in number, are invaluable from the vivid light they cast on the manners of the 17th century. His 'Miseries of War,' a series of eighteen plates,

and his 'Gypsies,' are especially celebrated. See the works on him by J. H. Green (1804), Thausing (1881), Meaume (1860), Dumast (1875), Houssaye (1875), Vachon (1886), and Bouchot (1890).

Callovian, a division of the Jurassic System (q.v.) on the Continent, represented in England by the Kellaways Rock.

Calluna, or HEATHER. See HEATH.

Callus is the exuded material by which Fractures (q.v.) of bones are consolidated. See CORNS.

Calmar. See KALMAR.

Calmet, AUGUSTINE, a learned Benedictine, was born at Mesnil-la-Horgue, near Commercy, February 26, 1672. Entering the order of Benedictines in 1689, he was successively appointed teacher of philosophy and theology in the Abbey Moyer-Moutier (1698), sub-prior at Munster in Alsace (1704), prior at Lay (1715), abbot of St Leopold (1718), and abbot of Senones in Lorraine (1728). He died at Paris, October 25, 1757. His exegetical writings have been commended by both Roman Catholics and Protestants. The *Commentary on the Bible* (23 vols. Paris, 1707-16), though marred by the author's defective knowledge of the oriental languages, contains valuable researches in biblical antiquities. His *Historical and Critical Dictionary of the Bible* (4 vols. 1722-28)—the first work of its kind—was translated into English, German, and other languages, and has passed through many editions. Of Calmet's other works, a *History of the Bible and of the Jews* (2 vols. 1718) and a *Universal History* (17 vols. 1735-71) are mere compilations; but his *History of Lorraine* (4 vols. 1728) is founded on original researches. See LIVES of him by Digot (Nancy, 1861) and Guillaume (ib. 1875), and the article in Herzog-Hauck (1900).

Calms, or CALM LATITUDES, are those tracts of the ocean on the confines of the trade-winds (see WINDS) which are subject to total absence of wind for long periods together. Their northern limit varies from 5° to 12° N., and their southern limit from 1° to 3° N. lat.

Calmucks. See KALMUCKS.

Calne, an old-fashioned market-town of Wiltshire, 6 miles ESE. of Chippenham by a branch line (1863). It has a town-hall (1882), a free grammar-school (1660), and a large bacon-curing industry. From the 14th century till 1885 Calne was a parliamentary borough. At a synod held here by St Dunstan in 977, relative to the celibacy of the clergy, the floor of the room gave way, precipitating all but St Dunstan to the ground. Pop. of borough, 3600. Bowood, 2 miles south-west, the seat of the Marquis of Lansdowne, is an Italian edifice by Adam; at Cherhill, 3 miles east, is the spirited figure of a White Horse (q.v.), 129 feet long, cut out in the chalk in 1780, and visible 50 miles off.

Caloeë, another name for Boehmeria (q.v.).

Calomar de, DON FRANCISCO TADEO, DUKE, a Spanish statesman, was born in 1775 at Vilel in Aragon, and becoming Minister of Justice under Ferdinand VII., persecuted the Liberals with cold-blooded cruelty, recalled the Jesuits, reopened the monasteries, and closed the universities. He also secretly favoured the party of Don Carlos, and in 1832, when Ferdinand was supposed to be on his death-bed, prevailed on the king to reintroduce the Salic Law, by which Christina was excluded from the throne. This excited the hatred of the nation; and Ferdinand, recovering, abolished the law. To avoid imprisonment, Calomarde fled to France, where he died at Toulouse in 1842.

Calomel is the popular name of one of the compounds of mercury, Hg, and chlorine, Cl, known to chemists as the subchloride of mercury or mercurous chloride, HgCl. It is prepared by taking two

equal portions of mercury, dissolving one portion in hot concentrated sulphuric acid, H_2SO_4 , which forms sulphate of mercury, HgSO_4 , thereafter adding the second part of the metal, and triturating the whole in a mortar till the metal becomes incorporated with the sulphate of mercury. This mixture is then added to about one-third of its weight of common salt, NaCl , and heated in a retort, when calomel sublimes, and condenses in the cool part of the receiver as a fine white powder. A minute portion of corrosive sublimate which accompanies it is removed by washing with water. Calomel is very dense. It is not soluble in water, and sparingly so in acids. It turns black on the addition of lime-water, potash, soda, or ammonia; and when heated in an iron spoon, or on a knife, it does not char, but rises in vapour, sublimes unaltered, and readily condenses again on any cool surface held near it. By these tests it may be readily distinguished from flour. Although calomel has been more used in British practice than any other preparation of mercury, it is not known to have been employed before the 17th century. It is the most valuable of the mercurial preparations, possessing, in addition to their general properties (see MERCURY), those of a vermifuge and purgative.

Calonne, CHARLES ALEXANDRE DE, Controller-general of Finance in France under Louis XVI., was born at Douay in 1734. He studied law, and having filled successively various offices, was made in 1783 Controller-general of the Treasury. In this capacity he soon gained favour among the courtiers, who had complained of the parsimony of Turgot and Necker. His plan was a simple one; he generously showered on the courtiers and people of influence sums which he obtained by borrowing and increased taxation. This could only last for a time; embarrassments grew on him till the inevitable crisis came; and in 1786, when the people could bear the extraordinary taxation no longer, Calonne advised the king to convoke the Assembly of the Notables, and proposed to abolish many of the privileges of the nobles, such as their exemption from taxes, and to distribute the burden of taxation more equally. The people and the aristocracy demanded a convocation of the States-general, instead of the Assembly of the Notables; but Calonne boldly proceeded with his plan, opened the Assembly of the Notables in 1787, and in a pleasant and florid oration described the general prosperity of French industry and commerce, and brought his speech to a climax by confessing that the annual deficit of the treasury had risen to 115 millions of francs, and that during the time from 1776 to 1786 the government had borrowed no less a sum than about 1250 millions! The Notables, instead of proceeding with Calonne's plan of reorganisation, demanded from him a statement of accounts. Not being able to give this satisfactorily, he was stripped of his dignities and banished to Lorraine. After this, Calonne resided chiefly in England, until in 1802 he obtained from Bonaparte permission to return to France, where, on 30th October, he died in very embarrassed circumstances.

Calophyllum (Gr., 'beautiful leaf'), an important genus of *Guttiferae* (q.v.). Some yield valuable timber—e.g. *C. angustifolium* of Penang—and are also a source of valuable resins. Several species supply Tacamahaca (q.v.). *C. Calaba* of the West Indies yields oil from its seeds, and is also a serviceable timber-tree. See POON-WOOD.

Caloric, an old term for a supposed imponderable fluid which was the cause of Heat (q.v.); and used loosely for heat. For Caloric Engine, see ARR-ENGINE.

Calorimeter is an instrument for measuring the specific heat of a body; the determination

being effected by ascertaining the quantity of ice at zero which is turned into water by the transference to it of heat from the body (at a known temperature) under examination. See HEAT.

Calotropis. See MUDAR.

Calottistes (*Le Régiment de la Calotte*), a society of witty and satirical men in the time of Louis XIV., who were headed by two officers in the king's bodyguard, named Torsac and Aimon. Their name was taken from the word *calotte* (a 'small cap,' worn by monks over the tonsure), and their amusement consisted in sending to any public character who had exposed himself to ridicule, a 'patent,' authorising him to wear the *calotte*, as a covering for the weak part of his head. As the society became audacious, and did not spare even royalty itself, it was dissolved by the minister Fleury. The *Mémoires pour servir à l'Histoire de la Calotte* (Basel, 1725) is an amusing little book. After the Restoration, the title *Régime de la Calotte* was applied to the priestly administration of affairs.

Calotype (Gr. *kalos*, 'beautiful,' *typos*, 'impression') was the name given in 1840 by Dr Fox Talbot to the method of photographing by the action of light on nitrate of silver, invented by him about that date. See PHOTOGRAPHY.

Calovius, ABRAHAM (originally *Kalau*), the chief representative of controversial Lutheran orthodoxy in the 17th century, born 16th April 1612 at Mohrungen in East Prussia, was successively professor at Königsberg (1637), preacher at Danzig (1643), and professor at Wittenberg (1650). He waged war incessantly on Arminian, Socinian, Reformed, and Catholic doctrines, and with the greatest bitterness against Calixtus. 'He was,' says Tholuck, 'formed by nature for a grand inquisitor: hard features, powerful under-jaw, staring eyes.' He was six times married, the last time in his seventy-second year. He died 25th February 1686. His chief writings are his *Systema Locorum Theologicorum* (12 vols. 1655-77), the *Historia Syncretistica* (1682), and his great *Biblia Illustrata* (4 vols. 1672).

Calpe, one of the Pillars of Hercules (q.v.).

Calprenède, GAUTIER DE COSTES DE LA (1610-63), a French officer of the guards and royal chamberlain, wrote many tragedies, &c., but is best known as author of the heroic romances—clever but endless and tedious—of *Cléopâtre*, *Cassandre*, and others. See NOVELS.

Calpurnius, TITUS, called Siculus, a Roman poet of the 1st century A.D. whose eclogues closely imitate Virgil's manner. See Postgate's *Corpus Poetarum Lat.* (Fasc. iv., 1904).

Caltabellotta, a small Sicilian town, 30 miles NW. of Girgenti, with an old castle (once Saracen) and a Norman church; pop. 6300.

Caltagirone, a city of Sicily, 38 miles SW. of Catania, manufactures pottery and statuettes of clay, and has technical schools. Ancient Sicel and Greek cemeteries surround the place. Pop. 40,000.

Caltanissetta, a fortified town of Sicily, 83 miles SE. of Palermo by rail. It has a cathedral, mineral springs, and extensive sulphur-works. Population, 42,000.

Caltha. See MARSH MARI-GOLD.

Caltrop, a four-pronged piece of iron, each prong about four inches in length, formerly thrown down in warfare to check the approach of the enemy's cavalry over a plain, or of besiegers in the ditch of a fortification.

Caltrop.

Calumba, or COLOMBO, is the root of *Jateorhiza columba* (or *palmata*), a Menispermaceous climber of Eastern Africa, which has been introduced into India. Sliced and dried, it has a greenish-yellow tint, a very bitter taste, and a faint aromatic odour. Its bitterness and other properties are ascribed to the presence of columbin, berberin, and columbic acid. It is a useful mild tonic and stomachic.—AMERICAN CALUMBA ROOT is obtained from *Frasera Walteri*, a gentianaceous biennial, and has properties like those of gentian.

Calumet, the 'peace-pipe' of the North American Indians, is a tobacco-pipe having a stem of reed or painted wood about two feet and a half long, decorated with feathers, with a large bowl, usually of red soapstone. After a treaty has been signed, the Indians fill the calumet with the best tobacco, and present it to the representatives of the party with whom they have been entering into alliance, themselves smoking out of it afterwards. The presentation of it to strangers is a mark of hospitality, and to refuse it would be considered an act of hostility. Originally *calumet* was merely the Norman name for a shepherd's pipe (Fr. *chalumeau*, Lat. *calamus*), which the early French settlers applied to the native pipe from its resemblance; and we find it thus applied by Père Marquette (1673), and in the earlier 'Jesuit Relations' of 1638. See illustration at TOBACCO.

Calumet, a township of Houghton county, Michigan, on a peninsula of Lake Superior, 42 miles N. of L'Anse by rail, including the village of Laurium (q.v.; formerly Calumet), with one of the richest copper-mines in the world—now much reduced. It has produced upwards of 50,000,000 lb. in a single year.

Calumny, LAW AS TO. See LIBEL, SLANDER.

Calvados, a French maritime department of Normandy. The principal rivers are the Touques, Orne, Dives, Seules, Aure, and Vire. The coast, which has few bays or inlets, is partly formed by bold ridges, and partly by sand-downs, cliffs, and reefs; the dangerous reef extending for 16 miles between the mouths of the Orne and the Vire was called Calvados, after the *Salvador*, one of the vessels in the Spanish Armada shipwrecked here, and from it the department takes its name. The soil is generally fertile, especially in the valleys, supplying rich pasturage for horned cattle, sheep, horses, and swine, which constitute the principal wealth of Calvados. The climate is moist, but healthy. Iron, marble, granite, and coal are found. The chief towns are Caen (the capital), Bayeux, Falaix, Honfleur, Lisieux, and Tronville. Area, 2130 sq. m.; pop. (1861) 480,992; (1891) 428,945; (1921) 384,730.

Calvaert, DENIS, called also DIONISIO FIAMMINGO, painter, was born at Antwerp about 1540, and settled at Bologna. There he opened a school, which numbered among its students the celebrated Guido Reni, Domenichino, and Albani, who afterwards, however, were pupils of the Caracci. Many excellent pictures by him are still preserved at Bologna. He died in 1619.

Calvary, the Anglicised form of the Vulgate *calvaria*, which was the Latin rendering of the Greek *kranton*, as that again of the Hebrew *golgotha* or *gulgatha*, all three words meaning 'a skull.' Why the scene of the Crucifixion was called 'the place of a skull' has been keenly debated, whether from the skulls of criminals lying about there, or from its being a round, bare, skull-like hillock. The latter is probably the true explanation; though none of the Evangelists offers any warranty for the current phrase, 'Mount Cal-

vary.' It lay beyond but nigh to the city. Consider its identification with 'the old "House of Stoning," or place of public execution according to the law of Moses, on the top of the remarkable knoll outside the Damascus gate, on the north side of Jerusalem, is exploded. It was from this cliff that the criminal used to be flung before being stoned (according to the Talmud), and on it his body was afterwards crucified; for the spot commands a view all over the city; and from the slopes round it the whole population might easily witness the execution' (see JERUSALEM).—In Catholic countries the term Calvary is applied to an eminence crowned with one or three crosses bearing life-sized figures of Christ and the thieves, and surrounded sometimes by a number of figures, representing the various personages who took part in the crucifixion. Along the approach to such a Calvary—the *Via Dolorosa*, the Way of the Cross—are sculptured representations of the Stations (q.v.) of the Cross.

Calverley, CHARLES STUART, the prince of modern English parodists, was the son of the Rev. Henry Blayds, who in 1852 took the name of Calverley, and was born on 22d December 1831. From Harrow he passed to Balliol College, Oxford, whence after a brief period he migrated to Christ's College, Cambridge, where he graduated as second classic in 1856. Within two years he was elected a fellow of his college. In 1865 he was called to the bar, and settled in London, but a fall on the ice in the winter of 1866-67 put an end to what might have been an exceptionally brilliant career. He died at Folkestone on the 17th of February 1884. One of the most gifted men of his time, and unrivalled as a humorist, Calverley will be remembered by his two little volumes, *Verses and Translations* (1862) and *Fly Leaves* (1872). His parodies, particularly that of Jean Ingelow, are the best that have appeared since the *Rejected Addresses*, and the delicacy of his scholarship finds admirable expression in his numerous renderings from Latin into English, and from English into Latin. The translation of Theocritus (1869) shows at once his ripe scholarship and his facile mastery of English verse. His *Literary Remains*, with a memoir by Sir W. J. Sendall, were published in 1885.

Calvert, FREDERICK CRACE, chemist, born in London in 1819, resided in France (1836-46), and settled as a consulting chemist in Manchester, where he died 24th October 1873. His researches in applied chemistry produced valuable results, and he was largely instrumental in introducing carbolic acid as a disinfectant. Besides numerous scientific papers, he published a work on *Dyeing and Calico-printing* (new ed. 1878).

Calvert, GEORGE HENRY, a many-sided American author, great-grandson of Lord Baltimore (q.v.), was born in Maryland in 1803, and studied at Harvard and Göttingen. His works, which exhibit considerable purity of style and originality of thought, embrace poems, tragedies, comedies, essays, translations from the German, and studies of Goethe (1872), Wordsworth (1878), Shakespeare (1879), and Coleridge, Shelley, and Goethe (1880). From 1843 till his death (1889) he lived at Newport, Rhode Island.

Calves'-head Club, an association instituted in contempt of the memory of Charles I., and holding its principal meeting on the 30th January, the anniversary of that king's execution, probably ceased to exist soon after the Restoration, though a meeting under the name—probably a hoax—led to a serious riot in 1735. According to the bitterly hostile *Secret History of the Calves'-head Club*, the founder was John Milton.

Calvi, a fortified seaport of Corsica, on a peninsula in the Gulf of Calvi, 38 miles WSW. of Bastia.

Calvi was captured by the English in 1794, after a siege of fifty-one days, during which Nelson lost an eye; it was retaken by the Corsicans in the following year.

Calvin, JOHN, was born at Noyon, in Picardy, on the 10th of July 1509. His father, Gérard Calvin or Cauvin, was procureur-fiscal of the district of Noyon, and secretary of the diocese. He was one of six children—four sons and two daughters. All the three sons who survived were bred ecclesiastics; and the reformer himself, while still only twelve years of age, was appointed to a chaplaincy in the cathedral church of Noyon. Calvin was educated in circumstances of ease, and even affluence. The noble family of De Montmor, in the neighbourhood, invited him to share in the studies of their children; he was in some measure adopted by them; and when the family went to Paris, in his fourteenth year, he accompanied them. He was entered as a pupil in the Collège de la Marche, under the regency of Mathurin Cordier, better remembered, perhaps, by his Latin name of Corderius. It was under this distinguished master that Calvin laid the foundation of his own wonderful mastery of the Latin language. During this early period, he was distinguished by the great activity of his mental powers, and the grave severity of his manners. His companions, it is said, surnamed him the 'Accusative.'

For a while his attention was directed to the study of law, and his father sent him to the university of Orléans, then adorned by Pierre de l'Etoile, one of the most famous jurists of his day. At Orléans, he continued the same life of rigorous temperance and earnest studiousness for which he was already noted. It was while a law-student in Orléans that he became acquainted with the Scriptures, and received his first impulse to the theological studies which have made his name so distinguished. A relative of his own, Pierre Robert Olivetan, was there engaged in a translation of the Scriptures; and this had the effect of drawing Calvin's attention, and awakening within him the religious instinct which was soon to prove the master-principle of his life. The seeds of the new faith were now beyond doubt sown in his heart, and from this time, although he still continued for a while longer to pursue his legal studies, his main interests appear to have been religious and theological. From Orléans he went to Bourges, where he acquired the knowledge of Greek, under the tuition of a learned German, Melchior Wolmar. He began here to preach the reformed doctrines, and passed over into the ranks of Protestantism, under the slow but sure growth of his new convictions, rather than under the agitation of any violent feeling. Here, as everywhere, his life presents a marked contrast to that of Luther.

He proceeded to Paris in 1533, which at this date had become a centre of the 'new learning,' under the teaching of Lefèvre and Farel, and the influence of the queen of Navarre, sister of Francis I. The Sorbonne itself had not escaped the infection. There was a growing religious excitement in the university, in the court, and even among the bishops. This, however, was not to last. The king was soon stirred up to take active measures to quell this rising spirit; and the result was that Calvin and others were obliged to flee for their lives. After this he repaired for a short time to his native place, resigned the preferment he held in the Roman Catholic Church, and for a year or two led a wandering life, sheltered in various places. We find him at Saintonge; at Nerac, the residence of the queen of Navarre; at Angoulême, with his friend Louis du Tillet; then for a brief while at Paris again. Persecution against the Protestants at this time raged so hotly, that Calvin was no

longer safe in France; and he betook himself to Basel, whence he issued, in the year 1536, the first edition of his *Christiane Religionis Institutio*, with the famous preface addressed to Francis I. The concentrated vigour and intensity of feeling of this address, rising into indignant remonstrance, and at times into pathetic and powerful eloquence, make it one of the most memorable documents in connection with the Reformation. After completing this great service to the cause of Protestantism, he made a short visit to Italy, to Renée the Duchess of Ferrara. Finally, he revisited his native town; sold the paternal estate, which had devolved to him on the death of his eldest brother; and, bidding Noyon adieu, set out in company with his younger brother and sister on his way to Strasburg. The direct road being rendered dangerous by the armies of Charles V., which had penetrated into France, he sought a circuitous route through Savoy and Geneva.

The result of this journey was memorable for the cause of the Reformation. Arrived in Geneva in the autumn of 1536, he met there his friend, Louis du Tillet, who communicated the fact of his arrival to Farel, then in the very midst of his struggle to promote the Reformation. Farel hastened to see him, and urge upon him the duty of remaining where he was, and undertaking his share of the work of God. Calvin did not at first respond to the call. He was given, he himself says, to his 'own intense thoughts and private studies.' He wished to devote himself to the service of the reformed churches generally, rather than to the care of any particular church. By some strange insight, however, Farel penetrated to the higher fitness of the young stranger who stood before him, and he ventured to lay the curse of God upon him and his studies if he refused his aid to the church of Geneva in her time of need. 'It was,' Calvin said, 'as if God had seized me by his awful hand from heaven.' He abandoned his intention of pursuing his journey, and joined eagerly with Farel in the work of reformation.

Having entered upon his task, he soon infused an energy into it which crowned the struggling efforts of Farel with success. The hierarchical authority was already overturned before his arrival; the citizens had asserted their independence against the Duke of Savoy. The magistrates and people eagerly joined with the reformers in the first heat of their freedom and zeal. A Protestant Confession of Faith was drawn out, approved of by the Council of Two Hundred, and then proclaimed in the cathedral church of St Peter's. Great and marvellous changes were wrought in a short time upon the manners of the people; where license and frivolity had reigned, a strict moral severity began to characterise the whole aspect of society. The strain, however, was too sudden and too extreme. A spirit of rebellion against the rule of Calvin and Farel broke forth; but they refused to yield to the wishes of a party animated by a more easy and liberal spirit than themselves, and known in the history of Geneva under the nickname of Libertines; and the consequence was, that they were both expelled from the city after less than two years' residence.

Calvin retreated to Strasburg, and devoted himself to theological study, especially to his critical labours on the New Testament. Here, in October 1539, he married the widow of a converted Anabaptist.

The Genevans found, after a short time, that they could not well get on without Calvin. His rule might be rigid; but an authority even such as his was better than no settled authority at all; and the Libertine party seem to have been unable to construct any efficient and beneficent form of

government. Accordingly, they invited Calvin to return; and after some delay on his part, in order to test the spirit in which they were acting, he acceded to their invitation, and in the autumn of 1541, after three years' absence, once more made his entry into Geneva.

Now at length he succeeded in establishing his plan of church-government. By his College of Pastors and Doctors, and his Consistorial Court of Discipline, he founded a theocracy, which aimed virtually to direct all the affairs of the city, and to control and modify both the social and individual life of the citizens. The Libertines still remained a strong party, which was even augmented, after Calvin's return, by men such as Ami Perrin, who had strongly concurred in the invitation to Calvin, but who were afterwards alienated from him by the high hand with which he pursued his designs, as well as by their own schemes of ambition. The struggle with this party lasted with various fortune for no less a period than fifteen years, and was only terminated in 1555, after a somewhat ridiculous *émeute* in the streets. Ami Perrin and others, driven from the city, were executed in effigy; and the reformer's authority from this date was confirmed into an absolute supremacy. During the long struggle with the Libertines occurred also Calvin's controversies with Sebastian Castellio, Jerome Bolsec, and, above all, Michael Servetus.

Calvin had become acquainted with Castellio at Strasburg. They entertained at first a warm friendship for each other, and Calvin showed great zeal in assisting Castellio, whose poverty and learning had attracted his sympathy. When he returned to Geneva, he invited Castellio to join him there, and procured for him the title of regent or tutor in the gymnasium of the city. There was little similarity, however, in the characters of the two men, and the diversity of their tastes and views soon became apparent. The learning of Castellio was intensely humanistic; and, as soon as he began to apply himself to theology, he came into conflict with Calvin. In a letter to Farel in 1542 we find Calvin speaking of the freaks of 'our friend Sebastian, which may raise both your bile and your laughter at the same time.' These freaks relate to Castellio's notions of scriptural translation, and his refusal of Calvin's offer to revise the version which he had made of certain parts of Scripture. Then, two years later, when Castellio desired to enter into the ministry, Calvin dissuaded the council from accepting him, on account of some peculiar opinions which he held. These were certain rationalistic views as to the authenticity and character of the Song of Solomon, the descent of Christ into hell, and the doctrine of election. After this Castellio left Geneva for a while; but, soon returning, he attacked the views of Calvin openly. After a violent scene in church, which is painted in Calvin's letters very strongly, he was forced to leave the city. The two old friends, now declared enemies, did not spare each other henceforth. The fate of Servetus drew forth an anonymous publication, attacking with keen logic and covert and ingenious sarcasm the Genevan doctrines. This publication was attributed by both Calvin and Beza to Castellio, and they replied to him in no measured terms, stigmatising him as a 'deceiver and vessel of Satan.'

The controversy with Bolsec belongs to the year 1551. Jerome Bolsec was originally a Carmelite monk, but he had thrown aside the habit, and betaken himself to the practice of medicine in Geneva. He was led to attack Calvin's doctrine of predestination. As soon as Calvin heard of this, he led him to understand that he was not at liberty to question the Genevan doctrine. He and the other clergy dealt with him; but after repeated

disputations Bolsec was found incorrigible, and was sentenced to banishment from the city. He ultimately rejoined the Roman Catholic Church, and revenged himself on Calvin by writing his life in a spirit of detraction and slander.

Of all these contests, however, the most memorable is that with Servetus. A melancholy interest encircles the name of this great heretic, which the criminal tragedy of his death keeps always fresh and vivid in the minds of all who hate intolerance, and who love truth rather than dogmatism. The character of Servetus himself has little to do with this interest. He seems to have been more of a vain, restless, and enthusiastic dreamer than of a calm and patient inquirer. In his very dreams, however, and the vague audacities of his speculation there is a kind of simplicity and unconscious earnestness that wins sympathy. He had entered into various connections with Calvin, even from the time of his early residence in Paris; particularly, he had sent him various documents containing the views fully developed in his work subsequently published under the title of *Restitutio Christianismi* (1553). Calvin never concealed his abhorrence of these views; and in a letter to Farel as early as 1546 he threatens that if Servetus should come to Geneva, he would do what he could to bring him to condign punishment: *Nam si venerit, modo valeat mea auctoritas, vivum exire nunquam patiar*. The history of his seizure and condemnation at Vienne by the Catholic authorities, and especially of Calvin's share in the correspondence which led to his seizure, is very complicated and obscure. It has been maintained that Calvin was the instigator, through a creature of his own of the name of Trye, of the whole transaction; it is *certain* that he forwarded to the authorities, through Trye, private documents which Servetus had intrusted to him, with a view to the heretic's identification, and as materials for his condemnation. Servetus was sentenced to be burned, but effected his escape, and, after several months' wandering, he was found at Geneva. It was his intention to proceed to Italy, where he hoped his opinions might meet with some degree of toleration, and he arrived at Geneva on his way. This is the explanation of an event otherwise unaccountable. Having ventured to church, according to the common account, he was recognised, apprehended, and conveyed to prison by Calvin's order, just as he was about to leave the city. The trial lasted, with various interruptions, for two months. He attacked Calvin with the most foul epithets, and Calvin retorted with a virulence and foulness quite equal to his own. At length, on the 26th of October 1553, sentence was passed upon Servetus, condemning him to death by fire. Calvin used his influence to have the mode of death alleviated, but without success. On the very next morning, the sentence was put into execution. On an eminence at some distance from the city, Servetus was fastened to a stake surrounded by heaps of oak-wood and leaves, with his condemned book and the MS. he had sent to Calvin attached to his girdle; and amid his agonising cries the fire was kindled, and the wretched man expiated his heresy in the flames. Whatever apologies may be urged for this memorable crime, it must remain a mournful and scandalous blot on the history of the Reformation. The disgrace of it has particularly attached to Calvin, but most of the Reformers are no less implicated in it. The wise Bullinger defended it, and even the gentle Melancthon could only see cause for gratitude in the hideous tragedy.

After the execution of Servetus, and the expulsion of the Libertines two years later, Calvin's power in Geneva was firmly established, and he used it vigorously and beneficently for the defence

of Protestantism throughout Europe. By the mediation of Beza he made his influence felt in France in the great struggle that was there going on between the hierarchical party, with the Guises at its head, and the Protestants, led by Condé and Coligny. In 1561 his energies began to fail. He had been long suffering from bad health, though his strength of will and buoyancy of intellect sustained him; but his health grew very much worse, and, although he survived for more than two years, he never regained any vigour. He died on the 27th of May 1564.

Very different estimates have been formed of Calvin's character. None, however, can dispute his intellectual greatness, or the powerful services which he rendered to the cause of Protestantism. Stern in spirit and unyielding in will, he is never selfish or petty in his motives. Nowhere amiable, he is everywhere strong. Arbitrary and cruel when it suits him, he is yet heroic in his aims, and beneficent in the scope of his ambition. His moral purpose is always clear and definite—to live a life of duty, to shape circumstances to such divine ends as he apprehended, and, in whatever sphere he might be placed, to work out the glory of God.

He rendered a double service to Protestantism, which, apart from anything else, would have made his name illustrious: he *systematised its doctrine*, and he *organised its ecclesiastical discipline*. He was at once the great theologian of the Reformation, and the founder of a new church polity, which did more than all other influences together to consolidate the scattered forces of the Reformation, and give them an enduring strength. As a religious teacher, as a social legislator, and as a writer, especially of the French language, whose modern prose style was then in process of formation, his fame is second to none in his age, and must always conspicuously adorn the history of civilisation.

His famous *Institutio* entitles Calvin to the foremost place among the dogmatic theologians of the Reformed Church. This masterpiece of luminous argument presents a complete system of Christian faith, based on the Protestant principle that the Scriptures are the source of Christian truth. 'Two things there are,' says Hooker in the preface to the *Ecclesiastical Polity*, 'which have deservedly procured him honour throughout the world—the one, his exceeding pains in composing the *Institutions of the Christian Religion*; the other, his no less industrious travails for exposition of Holy Scripture.' His commentaries embrace the greater part of the Old Testament and the whole of the New except the Revelation, and place him in the front rank of expositors of Scripture.—The first collected edition of Calvin's works is that of Geneva (1617), in 12 vols. folio; the second that of Amsterdam (1671), in 9 vols. folio. These have been superseded by a complete critical edition by Baum, Cunitz, Reuss, and Erichsen, which began to appear at Brunswick in 1863, and was completed in 59 volumes in 1900. By the 'Calvin Translation Society' in Edinburgh, his works were collected, translated into English, and issued in 52 vols. (1844–56).

The question as to the first edition of Calvin's *Institutes* is finally settled in the Prolegomena to the Brunswick edition of his works. It was published in Latin in the year 1536, and is now extremely rare. The work was revised and extended by Calvin in numerous later editions, both Latin and French. That of Robert Stephens, in 1559, containing Calvin's latest corrections, was reprinted by Tholuck (Berl. 1835; 2d ed. 1846), who also edited his *Commentarii in Novum Testamentum* (7 vols. Berl. 1833–34; 4th ed., 4 parts, 1864). His letters were published by Bonnet (2 vols. Paris, 1854); in an English translation by Constable and Gilchrist (1855 *et seq.*); and more fully in vols. 10–15 of the Brunswick edition. The libraries of Geneva and Zurich contain the MSS. of about 3000 unprinted sermons and other short

writings by Calvin. Beza's *Vie et Mort de Calvin* (1564, extended 1565; ed. Franklin, 1864) was abridged in Latin (1576). See Laves by Bolsec (1577; ed. Chastel, 1875), Jacques E. May (1657; new ed. 1835), Audin (1840, 6th ed. 1873)—all from the Catholic standpoint, also by T. H. Dyer (1850), Bungener (2d ed. 1863; trans. 1863), Pressel (1864), Vignot and Tissot (1864), Guizot (1873), Goguel (2d ed. 1873), Doumergue (1899), Williston Walker (1906); in German by P. Henry (1835–44; trans. 1849), and by Stahelin (1863); and in Dutch by Penning (trans. 1912). Kampschulte, Catholic Professor of History at Bonn, wrote *Johann Calvin, seine Kirche und sein Staat in Genf* (vol. i. 1869, ii. edited from his remains by Gotz, 1899). There is a large literature on Servetus and Calvin, as the works of Porter (1854) and Willis (1877). For Calvin and Geneva, see Galiffe's *Quelques pages d'Histoire exacte, soit les Procès intentés à Genève en 1547–59* (1862), and *Nouvelles pages d'Histoire exacte, &c.* (1876); Roget's *L'Eglise et l'Etat à Genève du vivant de Calvin* (1867), and *Histoire du Peuple de Genève depuis la Réformation* (4 vols. 1875–77); Schmidt's *Les Libertins Spirituels* (1876); Choisy's *La Théocratie à Genève* (1897). See also REFORMATION and works there cited, and *The Cambridge Modern History*, ii. (1904), and Lindsay's *History of the Reformation*. Noteworthy also are Lobstein, *Die Ethik Calvins* (Strasbourg, 1877), and Pierson, *Nieuwe Studien over Joh. Kalvijn, 1536–41* (Amsterdam, 1883).

CALVINISM is the system of religious doctrine associated with the name of Calvin, and supposed to distinguish the churches more particularly called the Reformed, in contradistinction to the Lutheran and Anglican churches. Calvin's doctrinal views are laid down at length in his *Institutio Christianæ Religionis*, first published in 1536, and finally revised in 1559. It was not till many years later, however, that the name of Calvinism came to be attached to a certain set of doctrinal opinions, and not till the rise of Arminius (q.v.), and the Synod of Dort (q.v.) in 1618, that these opinions may be said to have been polemically marked off from others with which they are generally contrasted, and to which they are recognised as standing in opposition.

The difference of thought expressed in the Arminian and Calvinistic systems is as old as the history of Christian doctrine. In almost every point, Augustine may be said to have anticipated Calvin; while Pelagius and the Eastern divines, such as Chrysostom, represented a type of opinion upon the whole consonant to that which in more modern times has been opposed to Calvinism. In the Roman Catholic Church, since the Reformation, the same opposition of thought has presented itself in the famous contest of Jansenism and Jesuitism.

The main point of distinction in these two systems or modes of Christian opinion is as to the operation of divine grace in the salvation of sinners. In the one system, this operation is considered as predetermined and absolute; in the other, as merely foreseen, and in some sense conditioned. *Predestination and Irresistible Grace* are the great key-notes of Calvinism—its two main points. Others were added in opposition to Arminianism—viz. *Original Sin, Particular Redemption*, and the *Perseverance of the Saints*; but the first of these is not peculiarly Calvinistic, and the last two are merely corollaries from the doctrines of Predestination and Grace. Predestination is, in fact, the one distinguishing doctrine of the system, as it was of Augustinianism, of which Calvinism was merely the revival. The divine will, apprehended as decreative and predestinating, is necessarily *irresistible* in its efficacy, *select* in its objects, and *persevering* in its results. The characteristic of Calvinism, therefore, is that it is a speculative Christian system, springing from a single great principle, carried out rigorously into all its logical consequences.

The Church of England, in its earlier history,

was Calvinistic in its Articles, although medieval and Catholic in its ritual. Puritanism was nothing else than a movement to reduce it altogether to a Calvinistic model. In the reaction which followed this movement, the Church of England, while retaining its original articles, nearly parted with its Calvinistic faith; and throughout the 18th century its chief divines are conspicuously Arminian or latitudinarian. But with the revival of the evangelical party in the end of the century Calvinism revived; and it still maintains, if not an absolute sway, yet a powerful influence over many minds in the Anglican establishment, while it is the professed creed of a great proportion of the dissenters.

The Church of Scotland, along with the other Presbyterian churches in the United Kingdom, and the large bodies of Presbyterians in America, all hold to the Westminster Confession of Faith, the most elaborate and formal expression of Calvinistic doctrine that exists. But, while holding to the same Calvinistic standard, these churches show many varieties of actual opinion; and in the history of Presbyterianism Calvinism has shown a tendency to pass into Rationalism or Unitarianism. This is conspicuously the case in the church of Geneva itself, and in some of the old Puritan churches of America. It still remains, however, as opposed to Arminian, Socinian, or any cognate forms of the same type of doctrine, at least one of the most living and powerful among the creeds of the Reformation.

Calw, or **KALW**, a town of Württemberg, on the Nagold, 35 miles WSW. of Stuttgart by rail, with manufactures of woollen and cotton fabrics, buttons, and cigars, and a trade in timber. Pop. 5000, nearly all Protestants.

Calx is the Latin term for quicklime. As quicklime is produced by heating limestone, the alchemists applied the term *calx* to the substance that remains after a metal or mineral is subjected to extreme heat, and *Calcination* (q.v.) to the process.

Calicanthus, a North American genus of Calycanthaceæ, a small order which connects Ranunculaceæ with Rosaceæ, and of which only a few species are known, natives of North America and Japan. They are square-stemmed aromatic shrubs. The bark of *C. floridus* (Carolina Allspice) affords a substitute for cinnamon.

Calycifloræ, a term introduced by De Candolle, and retained by Bentham and Hooker, to include those natural orders of dicotyledons in which the petals are separate, and the petals, stamens, and carpels borne on a flattened receptacle, as in Discifloræ, but in which the sepals also rise from its edge. As the most important calycifloral orders may be mentioned Rosaceæ, Leguminosæ, Crassulacæ, Saxifragaceæ, Umbelliferae, Myrtaceæ, Onagraceæ, Cucurbitaceæ, and Passifloraceæ. The name expresses the view that the stamens stand upon a united calyx; the study of development has, however, long ago shown that they really arise as usual from the axis. See FLOWER.

Calydonian Boar. Once upon a time, according to a Greek myth, (Enus, king of Calydon, the ancient capital of Ætolia, omitted a sacrifice to Artemis, whereupon the goddess, when he was absent on the Argonautic expedition, sent a frightful boar to lay waste his fields. No one dared to face the monster, until Meleager, the son of (Enus, with a band of heroes pursued and slew him. The Curetes laid claim to the head and hide, but were driven off by Meleager. Later accounts make Meleager summon to the hunt heroes from all parts of Greece, among them the maiden Atalanta, who gave the monster the first wound.

Caly'mene, a genus of the fossil order Trilobites (q.v.).

Calypso, according to Homer, a daughter of Atlas, inhabiting the solitary wooded isle of Ogygia, far apart from all gods and men. Odysseus being thrown upon her island by shipwreck, she treated him kindly, and promised him immortality if he would marry her. He was fascinated by her charms, but unwilling to desert his wife and native land; she detained him seven years, bore him two sons, and on his departure died of grief.

Calyptra. See MOSSES.

Calyptræa, a genus of molluscs, among Prosobranch Gastropods, and sometimes popularly known as Chambered, Cup and Saucer, Bonnet, or Slipper Limpets. The shell is indeed more or less limpet-like, but that ends the resemblance, while even in regard to the shell, the presence of a slight spiral, and of an inturned internal plate for the attachment of the principal muscle, are quite sufficiently distinctive. The shapes vary considerably. Some ten living species are known, mostly from warmer waters, though two are recorded as British. From the chalk deposits, however, three times as many species are known. The name Patella, or Limpet, was formerly mistakenly used to include Calyptræa and allied genera like Galerus and Crepidula. Pileopsis (*hungarica*), the Hungarian Cap Shell, is allied, and occurs in the Atlantic and Mediterranean.

Calyx. Although in some flowers the transition between ordinary foliage leaves and the floral envelopes immediately surrounding the stamens and carpels is a gentle and almost insensible one, we can, in the vast majority of cases, recognise the floral envelopes as clearly defined. The outer circle or whorl of these is what we term the calyx, the inner being the corolla; and the separate leaves of the calyx are termed sepals, corresponding to the petals. In most monocotyledons the outer and inner whorls of floral envelopes are essentially similar, and both are usually equally coloured or white; in these cases it is customary to unite them under the common term of *perianth*. In others, and in most dicotyledons, the calyx is green and leafy, and is sharply distinguished from the corolla, to which the floral colour is thus restricted; in other cases, however, especially when the floral envelopes are in a continuous spiral, as in the water-lily, the transition between leafy sepal and distinct petal is quite gradual. The leafy habit of the calyx varies within the widest limits; thus, we have on one hand the vegetative extreme, where the sepals are not only leafy in the flower, and perhaps even possess stipules (strawberry), but persist after the corolla has withered, and even grow up around the fruit, as in the winter-cherry (*Physalis*). Next, we have the most frequent case of ordinary green sepals, which wither or fall off when flowering has been accomplished, or they may drop off at a still earlier stage, when the flower opens, as in the poppy; or again, they may become petaloid, especially when the petals are reduced to nectaries, as in the Christmas rose or monkshood, or have disappeared altogether, as in the marsh-marigold. In the monochlamydeous orders of old classifications—e.g. Polygonaceæ, Chenopodiaceæ—the calyx also alone persists, but is small and inconspicuous; while in the so-called achlamydeous types this also disappears—e.g. willow; or, as probably in Casuarina and perhaps in the grasses, it may never have existed in any ancestor. In such cases the protective functions are performed by bracts, which often become reduced in their turn. Thus in grasses the protective glumes are not sepals, as was at first supposed, but bracts, and even the minute scales called lodicules may represent not sepals, but a bracteole.

The calyx is said to be *inferior* when, as in typical unmodified flowers, it occupies its normal place lower on the axis than the other parts, and particularly the ovary; in many cases, however, it is *superior*—i.e. borne upon the summit of the fruit, as in the apple or rose. The explanation of this used to be that an 'adherence' had taken place between the inner surface of the calyx and the outer surface of the ovary, and the term *adherent* was therefore frequently applied to it. Not only, however, is there no evidence in favour of this explanation, but we know, alike from the study of development, from comparative anatomy, and from physiology, that the inferior ovary comes into its place by the checking of the apical growth of the floral axis, which thus becomes cupped instead of pointed. This hollowing of the summit of the axis naturally begins at the point where the leafy sepals and expanded petals mark the limit where vegetation ceases, and the essential reproductive organs take the place of non-reproductive leaves. The apparent sinking of the 'inferior' ovary is, in short, the consequence of the onward growth of the portion of the axis which bears the 'superior' calyx. See FLOWER.

Cam. or GRANTA, a sluggish river of England, which, rising in Essex, flows 40 miles NW. and NE. through Cambridgeshire, and falls into the Ouse $3\frac{1}{2}$ miles above Ely. The name *Cam* is probably a mere figment, manufactured from *Cambridge*; see *Notes and Queries*, May 1901, p. 365.

Cam. DRAGO, a Portuguese explorer of the 15th century, who followed up the course of Prince Henry of Portugal, and in 1482 discovered the mouth of the Congo, near whose bank an inscribed memorial stone erected by him was found in 1887. He later examined the coast as far as 22° S. lat.

Camagitey. See PUERTO PRÍNCIPE.

Camaldolites, a religious order founded in the vale of Camaldoli, near Arezzo, in the Apennines, in 1018, by St Romuald, a Benedictine monk (died 1027), and which spread from Italy into France, Germany, and Poland. The brethren, who wore a white garment, were always characterised for the excessive rigidity of their monastic rule. Their dissensions early broke them up into several congregations; but in the 18th century, under five generals, they numbered 2000. The order is now almost extinct.

Camargue. See BOUCHES DU RHÔNE.

Camarilla (Sp., 'a little chamber'), a word first employed in the time of Ferdinand VII. of Spain (1814–33), and which now signifies throughout Europe the influence exercised on the state by the court-party, the favourites and sycophants of a pope or monarch, in opposition to the advice of his legitimate ministers.

Camayeu is a term by which painting in one colour, or monochrome, is designated. Pictures of several tints, but where the natural colours of the objects are not copied, are also said to be *en camayeu*. As one colour generally prevails, we speak of blue, red, yellow, green camayeu.

Cambacérés, JEAN JACQUES RÉGIS DE, Duke of Parma, and High Chancellor of the French empire under Napoleon, was born 18th October 1753, at Montpeller, where in 1791 he was appointed president of the criminal court. Afterwards, as member of the National Convention, he took a prominent part in sketching the new code of laws, and distinguished himself by his moderation. He denied the right of the Convention to condemn the king, and, when this was done, argued in favour of a reprieve. In 1794, as president of the Committee of Public Safety, he was active in procuring peace with Prussia and Spain. His *Projet de Code*

Civil, which afterwards formed the basis of the *Code Napoléon*, was laid before the Council of Five Hundred, of which body he was in 1796 for a short time president. He assisted in the revolution of the 18th Brumaire (November 9, 1799), was appointed Second Consul, and faithfully attached himself to the interests of Napoleon, by whom he was made High Chancellor of the Empire, and in 1808 Duke of Parma. He vainly endeavoured to dissuade the emperor from the projected invasion of Russia; and in 1813, when Napoleon took the field against the allies, he was left as president of the regency. He voted for the abdication of Napoleon. During the Hundred Days, against his own will, he was made Minister of Justice and President of the Chamber of Peers. In 1816 he was exiled for having taken part in the execution of Louis XVI.; but in 1818 his civil and political rights were restored, and he returned to Paris, where he died, March 5, 1824.

Cambaluc (*Khan-Baligh*, 'city of the emperor'), the name by which, during the middle ages, Peking (q.v.) became known to Europe, was rendered familiar by Marco Polo's travels.

Cambay (*Khambhāt*), the port and capital of a small Indian feudatory state of Bombay presidency, lies in the north-west portion of the peninsula, at the head of the Gulf of Cambay, 52 miles S. of Ahmedabad. Portions of its brick wall remain, and many ruins still attest its former magnificence and extent. The main cause of its decay has been the gradual obstruction of its seaward navigation. Its principal articles of export are its agate, cornealian, and onyx ornaments, for the manufacture of which the town is renowned. Pop. 30,000; at one time, 200,000. The area of Cambay state is 350 sq. m.; pop. 75,000, of whom about 15,000, including the Nawab, are Mohammedans.—The Gulf of Cambay, a large inlet about 80 miles long and 25 broad, was formerly a great commercial resort; but the shifting shoals and the high spring-tides (rising and falling 33 feet) are troublesome; and as the gulf is silting up, it is now mostly resorted to by craft of 5 to 10 tons burden.

Camberwell Beauty (*Vanessa antiopa*), one

of the largest and most beautiful of British butterflies, rare in Britain, although it has been found in many parts of the country, but common in the central and southern parts of Europe, and having an extensive range in North America, where there are also two varieties, very close to the typical form. The wings are of a deep purplish-brown colour, with a band of black around the brown, and an outer band or margin of pale yellow, the black band containing a row of large blue spots, the yellow margin dappled with black or brown specks, all the colours rich and velvety. The margin of the wings exhibits tooth-like angularities. The antennae are terminated by a knob. The caterpillar feeds on the willow, elm, and poplar. It is black, with white dots and a row of large red spots down the back, and is rough with soft spines. When

Camberwell Beauty :

a, larva or caterpillar; b, pupa.

Camberwell (now a parliamentary borough in

South London) was a rural place, and abounded in willows, this butterfly was sometimes taken there. *V. Milberti* is a smaller species common in the cooler parts of North America.

Cambium (Lat. *cambio*, 'I change'). The growing point of any stem is composed of one or more actively dividing cells. In the growing point of a fern a single apical cell can still, though with difficulty, be distinguished amid the mass of embryonic cells from which the future tissues are forming, but in higher plants all the cells of this 'meristem,' as it is termed, are equally endowed with the power of division. As the plant grows, the new cells constantly formed behind the apex are modified at first into the embryonic layers from which epidermis, fibro-vascular bundles, and parenchyma are developed, but these are no longer capable of continued growth, and the bundles are said to be definite. Hence monocotyledons and herbaceous dicotyledons do not increase in thickness; but in coniferous and perennial dicotyledonous stems a layer of embryonic cells remains undifferentiated between the wood and bast of the fibro-vascular bundles, and continues in a state of division as the *cambium*. The bundles thus grow in thickness by the differentiation from the cambium layer of new layers of wood and bast which press apart those already formed. (For cut and fuller details, see BARK.) The wood and bark thus undergo an increase in thickness, which is most marked in spring and early summer, but proceeds more slowly towards autumn, and stops entirely in winter. The bundles are thus said to be indefinite, and their seasonal rhythm of growth is recorded in the familiar rings of wood and layers of bark (see BARK and WOOD). These are always easily separable, since the delicate intervening cambium-cylinder gives way much more easily than the formed tissues, leaving, when torn, its thin-walled protoplasmic cells as a moist and viscid layer covering the harder surfaces of these. In thin transverse sections of stems the cambium cells can readily be made out, with their closely parallel walls indicating their plane of division longitudinal and parallel to the outer surface of the stem.

In exceptional cases, a cylindrical layer of meristem may persist outside the fibro-vascular bundles altogether, and immediately under the epidermis and cellular envelope, which become thickened as a false bark or *rind*. From this may be continuously deposited entirely new bundles of definite type, the stem thus increasing in thickness, as in the dragon-tree (*Dracæna*) and other arborescent monocotyledons. In the dicotyledonous *Bongainvillea* also the stem is thickened in essentially the same way. See DICOTYLEDONS.

The layer of embryonic cells from which cork is formed is called cork-cambium by many writers. See CORK.

Cambodia (Fr. *Cambodge*), nominally a state in Indo-China under a French protectorate, but practically a French dependency, on the lower course of the Mekhong, was greatly increased by the treaties of 1904 and 1907, whereby Maluprey, Baisak, Battambang, Siem-Reap, and Sisophon were added, though the adjoining coast-strip was restored to Siam. It is bounded on the SE. and S. by French Cochín-China; on the SW. by the Gulf of Siam; on the N. by Siam; on the E., towards Annam, where the frontier traversing imperfectly explored territories is vague, by the territories of independent Mois tribes. The coast, indented by the bay of Kompong-Som, offers but one port, Kampot, suitable only for river trade. Most of the numerous islands along the coast are inhabited. In the north and west are some extreme ramifications of mountain-chains descending from the

Central Asian plateau; on the north the frontier-chain of Phnum (i.e. 'mountain') Dangrek; and, between the Great Lake and the Gulf of Siam, Crévanh, Tek-Liang, Pang-Chak, Thiang-Ho, Elephant Chain, Bombi Cone; some of them over 3000 feet high. The mountains generally contain iron, limestone, sandstone, and more sparingly, copper. The greater part, however, of Cambodia consists of alluvial plains, completely inundated during the rainy season. In the north-east are schistose forest-clad tracts. The principal river, the Mekhong (in Cambodian, Tonlé-Tom—i.e. 'great river'), flows through Cambodia from north to south as far as Chen-Tel-Pho, and thence south-westwards till, at the town of Pnom-Penh, it divides into two arms, the Han-Giang or Bassac, and the Tien-Giang or Anterior River, both flowing south. Above Pnom-Penh is a north-north-west outlet for the surcharge of the Great River, the Tonlé-Sap (i.e. 'river of sweet-water'), expanding into the Great Lake, 100 miles by 25 miles in extent, with a depth of 65 feet at its maximum magnitude. The periodical risings of the Great River deposit rich mud strata over the surrounding plain to a wide extent. Numerous tributaries discharge into the Mekhong and Tonlé-Sap. Flowing into the Gulf of Siam are Kompong-Som and Kampot. The climate is divided into the rainy season, from April to October, but interrupted in August, and the dry, from October to April. The thermometer ranges from 70° to 104° F., but on the high plateaus sinks as low as 59° F. The natural products are more numerous and varied than in French Cochín-China: rice, the principal cereal, betel, tobacco, indigo, palm-sugar, silk-tie, pepper, maize, cinnamon, coffee, cotton, fruits, &c. The forests contain excellent timber. The fauna of Cambodia comprises the elephant, tiger, panther, bear, rhinoceros, ape, buffalo, &c. Cambodia supplies Cochín-China with a large part of the cattle it consumes. The horses of Cambodia are small and robust, with remarkably large heads. Birds, principally wading birds, abound. Crocodiles are found in most of the rivers.

The area is 26,000 square miles. The population numbered 3,800,000 at the census of 1921, and included, besides several native races, many Chinese and Annamites, a considerable number of Malays, and a few Europeans. Pnom-Penh, the capital, at the junction of the 'Four Arms,' has a population of 90,000 of very mixed race. The Cambodians approach the Malay and Indian types, are less Mongoloid and more nearly resemble the 'Caucasian' type than their neighbours. They are tall and robust, copper-coloured rather than yellow, the skull elongate, the nose, though flat, more prominent than in the Annamite, and the eyes very slightly oblique. Subject for centuries to foreign incursions and mandarin exactions, the Cambodian, long without foothold of his own, and restricting himself to the barest necessities, has grown indolent and passive, the more so that the rich loam yields its abundance for almost no cultivation. The principal industry is the fishing of the Great Lake, beginning in November, and employing thousands of persons. In Kompong-Soai are manufactures of iron. Emeralds and rubies are got in the mountains of Purrat. Salt is worked. The chief outlet for the exports of the country—rice, salt fish, haicots, cardamoms, palm-sugar, skins, tobacco, cotton, mats, silk, gamboge, ivory, tortoise-shell, pepper—is Saigon in Cochín-China, which is in communication by the river Mekhong with the greater part of Cambodia.

The religion of Cambodia is a development of Buddhism, in which the worship of ancestors forms a large part. Instruction is given by

the priests. The common reckoning of time dates from 638 A.D. The Cambodian language has much in common with the other monosyllabic languages of Indo-China, especially those of Siam and Annam. It lacks, however, the varieties of tones, or inflections of voice, by which these discriminate between the different significations of the same monosyllable. The letters are borrowed from the Indian Pali, the parent of all the Indo-Chinese alphabets. Besides the current idiom there is a sort of literary language of Pali vocables used in official ceremonies. Nominally Cambodia is still a kingdom. The king's younger brother is a general with the title of second king. The whole of the French possessions in Indo-China are now, by decree of 1887, united under the name of Indo-China, with a governor-general at its head, Cambodia having placed over it a resident-general under the governor-general.

The ancient kingdom of Cambodia or Khmer formerly extended over a large part of Indo-China. Buddhism would appear to have been introduced in the 4th century. The Portuguese in the 16th century were the first Europeans to explore the valley of Tonle-Tom, and to this day descendants of the Portuguese are to be found in Cambodia. Close on the Portuguese followed Spaniards from Manila, and about 1650 the Dutch set up their factories at the mouth of the Mekhong. The Khmer kingdom became dismembered in the 17th century, when Annam took successively Baria, Bien-Hoa, Saigon, Mytho, and Vinh-Long, and in 1715 Chandoe and Hatien. A century later (1812) Siam wrested the provinces west of the Great Lake: Battambang, Angkor, Tonlé-Repon, and Melu-Prey. In 1858 France first appeared in Indo-China. Having made herself mistress of the Annam provinces of the delta of the Mekhong, France on the 11th August 1863 concluded a treaty with the new king of Cambodia, Norodom, placing Cambodia under a French protectorate. This treaty has been superseded by that of the 17th June 1884, under which the king of Cambodia accepts all the reforms, administrative, judiciary, financial, and commercial, which the government of France may deem advisable. Some provinces were added in 1907.

Ancient Sculptures.—The most remarkable feature of Cambodia is the splendid ruins of Khmer architecture. The temples and palaces of Angkor were known to Portuguese missionaries in the 16th century. A graphic account of Cambodia by a Chinese traveller who spent two years (1295-97) in that kingdom, was translated by Abel Rémusat in 1819. In 1858-61 M. Mouhot, a French naturalist, explored the valley of the Mekhong, &c. He was followed by Dr Adolf Bastian. Later, J. Thomson took a plan of Angkor-Vaht, with 30 photographs of it and other places. The French next fitted out two expeditions, the first under Captain de Lagrée (1866), and the second (1873) under Captain Delaporte. The great piles explored number over 50, while the smaller isolated structures are counted by the hundreds. The temple of Angkor-Vaht occupies a larger area than that of Karnak in Egypt, and just as vast are the monuments of Préa-Khan (near Angkor), of Méléa, and of Pontéay-Chma. Those of Baion, Préa-Khan (province of Kompong-Soai), Ta-Prohm, Ka-Kéo, and Ek-dey constitute likewise immense groups. More remarkable than their magnitude and number is their artistic value, the finest productions deserving to be ranked even with the masterpieces of the West. The Khmer structures are characterised by grandeur and unity of design, and are, moreover, for the most part entirely overlaid, profusely but unconfusedly, with delicate ornamentation. In a single temple of Angkor are 1532 columns, and the mountain yielding the stone is 32 miles distant.

The joinings are scarcely perceptible—no sign of mortar, no mark of chisel, the surface as polished as marble. Pale or fallow sandstone, bright red brick, and Bien-Hoa stone of sombre rusty colour, are blended in the Khmer architecture for polychromatic effect. Among the ruins are massive stone bridges so solidly constructed as to have almost all resisted the periodical inundations and shock of huge tree-trunks hurled against them. The bridge of Spean-Tenk measures 470 feet in length, and has 34 arches. Monuments so vast, so numerous, and so diverse are calculated by Delaporte to range from the beginning of our era to the 15th and 16th centuries, the finest dating from between the 8th and 13th or 14th. The present degenerate descendants of those Khmer architects look up to these structures from which they are now so far aloof as the work of 'angels' or 'giants,' if not the product of spontaneous generation.

See E. Aymonier, *Le Cambodge* (Paris, 1900 *et seq.*) and other works, and for the language, his dictionaries (1874; 1906); Lagrillière-Beaulerc, *A Travers l'Indo-Chine* (1900); A. H. Mouhot, *Travels in Indo-China*; J. Moura, *Cambodge* (Paris, 1882); L. Delaporte, *Voyage au Cambodge*; F. Garnier, *Excursions et Reconnaissances* (Saigon), viii., xii.; Lajonquière, *Inventaire descriptif des Monuments du Cambodge* (1907); Leclère, *Histoire du Cambodge* (1914); Russier, *Histoire Sommaire du Royaume du Cambodge* (1916); De Beerski, *Angkor* (1923).

Cambodia River. See MEKHONG.

Camborne, a town of Cornwall, 12 miles WSW. of Truro by rail, has a mining school and very productive copper, tin, and lead mines. Pop. of urban district, 15,000.

Cambrai, a city and first-class fortress of the French department of Nord, on the Scheldt, 128 miles NNE. of Paris by rail. It is well built, with tolerably wide but irregular streets, and many picturesque old houses. Among the principal public buildings are the town-house (partly destroyed in the Great War), archiepiscopal palace, and cathedral, the last rebuilt after the fire of 1859, and also seriously injured in the war. Its predecessor had been partially destroyed in 1793 by the revolutionists. They also disintombed the remains of Fénelon, who was archbishop here, and melted his lead coffin into bullets; a monument to him, however, by David d'Angers, erected in 1826, fortunately survived the fire, and was placed in the new cathedral. The town also contains a college, theological seminary, and library. The manufactures are important, consisting of cambric—so called from its manufacture here—linen thread, lace, sugar, soap, leather, chicory, &c.; and there is a large trade in agricultural produce. Pop. 26,000.

Camaracum, the ancient Cambrai, was one of the chief cities of the Nervii. It was fortified by Charlemagne, and was long governed by its own bishops, to whom the emperor Henry I. ceded it; taken by the Spaniards in 1595, it was delivered to France by the treaty of Nimeguen (1678). The celebrated League of Cambrai against the republic of Venice, which comprised the pope, the emperor, and the kings of France and Spain, was entered into here in 1508; here also in 1529 the aunt of Charles V. of Spain and the mother of Francis I. signed the *Paix des Dames*, by which Burgundy was restored to France, who in return renounced her claims to Artois and Flanders. During 1815-18 Cambrai was the headquarters of the British army of occupation. Some of the most notable fighting in the Great European War (q.v.) occurred here. The town was in German hands most of the time, and a great part of it was wrecked.

Cambrensis, GIRALDUS. See GIRALDUS CAMBRENSIS.

Cambrésis, a district in France, including the

town of Cambrai. For Cateau-Cambrésis, see CATEAU (LE).

Cambria, the ancient name of Wales, the *Britannia Secunda* of the Romans. It is derived from the word Cymry or Kymry, the name by which the Welsh have always called themselves, and appears in 'Cambrian Mountains' and 'Cambrian System.' *Cumbria*, the name of the old British kingdom also called Strathclyde, and *Cumberland* are other derivatives.

Cambrian System. This is the name given to the great series of sedimentary deposits which comes next in order of succession to the Archæan System (q.v.). Wherever the base of these deposits can be seen, the beds are found to rest unconformably upon the Archæan, or, as they are sometimes termed, the pre-Cambrian rocks. There is some diversity of opinion as to the upper limits of the Cambrian. The name was introduced by Professor Sedgwick, by whom it was made to include a great thickness of strata which most geologists now prefer to consider as forming the lower portion of the succeeding Silurian System (q.v.). The classification now generally adopted for the British Cambrian is as follows:

Upper or Olenus zones.....	{ Tremadoc slates.
	{ Lingula flags.
Middle or Paradoxides zones..	{ Manevian group.
Lower or Olenellus zones.....	{ Harlech and Llanberis group,
	{ and basement volcanic series.

The British Cambrian rocks are best developed in North Wales, where they exceed 12,000 feet in thickness, and are also well represented in Shropshire, &c. They consist largely of coarse red and purple graywackes, sandstones, grits, and conglomerates, and grayish blue and green slates and slaty shales; and the same general character is maintained by the rocks of this system in the east of Ireland. In the north-west of Scotland, however, the system, some 2000 feet in thickness, is represented chiefly by dolomite and limestone, with underlying shales and quartzites. It is noteworthy that the fossil fauna of the Scottish Cambrian is of a distinctly North American type, and does not resemble the fauna of the Welsh Cambrian. The Welsh Cambrian strata are largely unfossiliferous—organic remains being met with chiefly in the higher members of the system. The plant-life of the period is very sparingly, if at all, represented, for it seems doubtful if the fucoïd-like markings are really traces of plants. Some of these are almost certainly inorganic—mere wrinkles on the surfaces of the beds, while others are not improbably the tracks or trails of worms, crustaceans, &c. One of the forms which have been bandied about between the vegetable and animal kingdoms is *Oldhamia*, some holding it to be a calcareous seaweed, others ranking it with the Polyzoa, while yet others think it is probably of inorganic origin. Animal life, however, is surprisingly well represented, as by sponges (*Protospongia*), early forms of graptolites (*Dictyograptus*), sea-lilies (*Dendrocrinus*), cystideans (*Protocystites*), star-fishes (*Palæasterina*), and early types of corals (*Archæocyathus*). Worm-burrows and worm-castings often abound, and crustaceans are plentiful—the modern groups of Ostracoda (water-fleas) and Phyllopods (brine-shrimps, &c.) being represented. The most notable crustaceans, however, are the Trilobites (q.v.), some of which were very minute and blind (*Agnostus*), while others attained a length of one or two feet (*Paradoxides*). The Brachiopods belong almost exclusively to the 'inarticulate' group—the three most characteristic forms being *Lingulella*, *Discina*, and *Obolella*. Four out of the five classes of Molluscs now existing appear in the Cambrian—viz. lamellibranchs, pteropods, gasteropods, and tetrabranchiate cephalopods. The last are re-

presented by straight and curved chambered shells (*Orthoceras*, *Cyrtoceras*) which belong to the family of the Nautilidæ. The lamellibranchs and gasteropods, which attain their maximum in our own day, appear to have been but sparsely present in the seas of Cambrian times, but some of the gasteropods, such as the snail *Pleuromaria*, are types still living. The same, it may be remarked, is the case with some of the brachiopods (*Lingulella*, *Discina*), which have persisted to the present day. No indubitable traces of vertebrate life have yet been supplied by the Cambrian strata, nor have we any evidence of land or fresh-water forms, although it is quite possible that some of the molluscs may have lived in estuaries or brackish water. The general character of the sedimentary rocks, with their conglomerates, grits, &c., ripple marks, and animal tracks, is indicative upon the whole of shallow-water conditions; and the paucity of corals and of limestones points in the same direction. Although the fauna of the Cambrian is less varied and abundant than that which has left its traces in the succeeding Silurian, yet we cannot but be struck with the fact that the former is relatively so varied. For here in the very oldest fossiliferous strata we have most of the larger divisions of the animal kingdom represented. Hence those who believe in the doctrine of evolution are of opinion that the Cambrian fauna cannot possibly be the earliest, but must have been preceded by a long series of ancestors; and not only so, but that many forms of life must have existed in the Cambrian seas which have left no trace behind them.

Cambrian rocks have been recognised in various other parts of Europe, as in central and southern Sweden, where the strata are not nearly so thick as in the British area. In central Brittany and in the Ardennes they are likewise represented, and they also come to the surface in several provinces of Spain. The most important continental area, however, is that of Bohemia, where the palæozoic rocks and their fossils were studied in great detail by M. Barrande. He divided the strata into several zones, his *primordial zone* having yielded many organic remains, especially trilobites belonging to characteristic Cambrian genera. In North America the Cambrian system comprises an upper series of sandstones, shales, limestones, &c. (*Potsdam*); a middle series of shales, limestones, &c. (*Acadian*); and a lower series of shales, slates, and calcareous strata (*Georgian*). These strata have been recognised in Newfoundland, Nova Scotia, New Brunswick, and in the states of Massachusetts, Vermont, and New York. They appear also in many different places along the Appalachian chain and in the region of the Rocky Mountains.

The Cambrian rocks of western and central Europe are frequently much altered and metamorphosed, while in North America they show over certain wide areas comparatively little alteration—the *Potsdam* sandstone especially being not unlike many 'freestones,' so that it is much used for building purposes. Igneous rocks (diorite, diabase, quartz-porphry, &c.) are associated with the Cambrian in various parts of Europe. Not much can be said as to the physical and climatic conditions of the Cambrian period. The strata, as we have seen, point generally to shallow seas. The main land-surfaces in the European area probably lay towards the north and north-west of the regions now occupied by Cambrian strata. But large islands of Archæan rocks may have existed in middle Europe. The general character of the Cambrian fauna does not justify us in forming any conclusion as to the climatic conditions of the period. All we can say is that there is no evidence to show that the climate of the globe was then differentiated into distinct zones as it is at present.

Cambric, a general term applied to the finest and thinnest of linen fabrics, said to be derived from Cambrai, where such goods were first made. Some of the finest cambrics of the present day are produced in Switzerland. Scotch cambric is really a muslin, being made of cotton with the fibre twisted very hard, to imitate real or linen cambric.

Cambridge, the county town of Cambridgeshire, lies on the winding Cam, 58 miles N. by E. of London, and 76 N.E. of Oxford. The town owes its existence to the fact that the hills on each side of the valley of the Cam approach one another in such a way as to make this the most suitable point for crossing the fens. Two important ancient roads, *Akemian Street* and the *Via Devana*, here cross the valley of the Cam, and were guarded by fortifications which used to be identified with *Camboritum*, the outlines of which can still be clearly traced on the north side of the river. In their centre is the artificial mound, now known as *Castle Hill*, which is believed to be later than Roman. The Romans occupied the site, but there is no evidence that they fortified it.

When the Norman castle was built on this site a displacement of inhabitants is recorded to have taken place; but even then the town or village of *Grantabrygge* probably stood on the present site, on the south side of the Cam, where *St Benedict's* tower (see below) seems to indicate that there was a village at any rate in existence. Cambridge was a town of some importance from the Norman conquest onwards, but from the 13th century its history has been merged in that of the university.

The town, as distinguished from the university, has not many features of interest. It possesses a guildhall, corn exchange, free public library, and jail. There is also a fine county hospital founded under the will of Dr Addenbrooke in 1743, and an extensive recreation ground named *Parker's Piece*. Amongst the older churches, the most interesting are *St Benedict's* and the church of the *Holy Sepulchre*. *St Benedict's* (or *St Benets*) has a tower which is a fine specimen of the so-called Saxon architecture, with 'long and short' work, and is probably the oldest building now standing in the town. The church of the *Holy Sepulchre*, the oldest of the four surviving round churches in England, was built about 1120-40 in imitation of the church of the *Holy Sepulchre* at Jerusalem. It was unfortunately restored by the Camden Society in 1841. The parish church of *Great St Mary's* is also the church of the university, at which all academic services are held. In 1887-90 there was built a Roman Catholic church, dedicated to 'Our Lady and the English Martyrs,' with a spire 215 feet high. The country round Cambridge is somewhat flat and dull; but on the west side the grounds known as 'the Backs' of the colleges are very beautiful, consisting of gardens, meadows, and avenues. The Cam flows through them. Above Cambridge it is a small but picturesque stream. Below it is dull and ugly, but is used for boat-racing. On account of the narrowness of the river only 'bumping races' can be rowed (see *ROWING*). Since 1885 the borough has sent one member to parliament, instead of two as formerly. Pop. (1851) 27,815; (1871) 30,078; (1881) 40,878; (1921) 59,262.

THE UNIVERSITY OF CAMBRIDGE is one of the two ancient institutions of the kind in England. Authentic records of its origin are entirely wanting, and their place has been supplied by fables. It is probable that the true history of the university begins in the 12th century. (On the beginnings of the university system in Europe, see *UNIVERSITIES*.) Certain writs of Henry III., of 1231, are the earliest record of an attempt to introduce discipline amongst the students attending the lectures. It was about this time that the students, who had

previously lived each in his own lodging at his own charges, began to live together in hostels under the rule of a principal. These hostels were named after the saints to whom they were dedicated, the churches which they adjoined, or the persons who built or formerly possessed them. In 1280 there were as many as 27, and some of them contained from 20 to 40 Masters of Arts, and a proportionate number of younger students; but all these hostels decayed by degrees when endowed colleges began to appear. Some were absorbed by the colleges, and some ceased to exist. *Trinity* hostel survived all the rest, and continued till 1540.

A college is an incorporated body of teachers and students enjoying the benefactions of a generous founder. *Peterhouse*, the oldest college in the university, was founded in 1284; and it was between the middle of the 13th and the close of the 16th century that, with one exception, all those royal and religious foundations were endowed which superseded the hostels and now constitute the university. It is by the possession of the college system that the sister universities of Oxford and Cambridge are distinguished from those of Scotland and the Continent.

The colleges were to a large extent modelled on the pattern of the monasteries. In some instances (as *Emmanuel College*) the colleges were united with religious houses already existing. Hence arose some of the peculiarities of the college system, which survived till a very recent date. To this cause is to be traced the condition of celibacy, upon which, with few exceptions, the fellowships were formerly tenable. The final abolition of restrictions as to marriage and as to holy orders (except in the case of offices with clerical functions) took place in 1881, when new statutes were issued by the Cambridge commissioners under the Universities of Oxford and Cambridge Act, 1877.

The endowment of university professorships dates from the 16th century. In 1502 Lady Margaret, mother of Henry VII., founded the Lady Margaret professorship of Divinity. Henry VIII. in 1540 founded the five regius professorships of Divinity, Civil Law, Physic, Hebrew, and Greek. The earliest mathematical professorship was that founded by Henry Lucas in 1663.

Cambridge was frequently visited by the plague, and university proceedings were suspended by it in 1642 and 1666. In the civil wars the university took the part of the king, and most of the colleges sent their plate to him at Nottingham. Cromwell occupied the town in 1643, and the most eminent royalists were expelled from the university.

During the 19th and 20th centuries the university has been reformed to meet modern needs, both by external authority and upon its own motions. Religious tests have been abolished, the field of study has been widened, non-collegiate students (see below) admitted, and examinations, research courses, and degrees (with limitations) are open to women, but not full membership of the university.

In order to understand the constitution and organisation of the university, it is necessary to bear in mind the fundamental distinction between the university and the colleges, due to the historical conditions of their respective origins. The governing body of the university is the senate, which is composed of persons of the standing of Masters of Arts. The matters of which the senate has cognisance are the management of the property of the university, the courses of study and examinations to be pursued by those who seek a degree, and public discipline and morals. But all proposals submitted to the senate must be approved by the council—a body elected by the resident members of senate. After the Chancellor and High-steward, the chief executive power is vested in the Vice-

chancellor, who is elected annually from among the heads of colleges, but in practice holds office for two years. The Public Orator is the voice of the senate upon public occasions. The Proctors superintend the discipline and morals of all persons *in statu pupillari*; they are present at all congregations of the senate, read the 'graces,' and take the votes. The Registry is responsible for the graces being offered in due form, and has charge of the university records. There are three terms—Michaelmas, Lent, and Easter. To take an ordinary B.A. degree, a student must reside nine terms. The M.A. degree follows, without examination, about four years after. Dissenters are not now excluded from taking degrees, except in divinity. The university sends two members to parliament, who are elected by the graduates.

Each college is governed by its Master and Fellows, or by the Master and Council, a select committee of the fellows. When questions arise as to the interpretation of the statutes, they are referred to the Visitor of the college. The college officers concerned with questions of discipline are the dean and tutor. The Tutor of the college is *in loco parentis* to his pupils; the Dean has the oversight of 'religion and morals.'

There are five classes of students—viz. *Fellow Commoners* and *Noblemen, Scholars, Pensioners, Sizar*s and *Sub-sizar*s, and *Non-collegiate Students*. The first class (now almost obsolete) are so called from their dining at the Fellows' table; they wear silk or embroidered gowns, and pay heavier fees. The Scholars are members of the foundation, and are elected, after examination, from the pensioners and sizar, or from students who have not yet begun residence. The Pensioners are the great body of students, are not on the foundation, and pay for their own commons—viz. dinners in hall, &c.—and for their rooms. The Sizar are poorer students, selected, however, by examination, who receive free commons and certain money payments, are admitted at lower charges than the pensioners, but wear the same dress, and are no longer subject to the performance of menial offices as they once were. Some of the colleges, especially St John's and Trinity, have very liberal endowments for the sizar. Non-collegiate students are not members of any college, but are entitled to the privileges of members of the university, and are placed under the charge of the Censor of non-collegiate students. The system of non-collegiate students dates from 1869. Before a student can be admitted, he must at nearly all the larger colleges pass an elementary entrance examination. Where there is no entrance examination, the student is required to furnish satisfactory evidence that he is qualified for admission. It is also necessary to deposit a certain sum of money with the tutor of the college as caution money. The Fellows are elected from the students who have distinguished themselves in the Tripos examinations, or in a special fellowship examination. Vacancies are, as a rule, filled up from members of the college, but fellowships are sometimes open to the competition of the whole university. Fellowships vary greatly in value and conditions of tenure at the different colleges. The length of tenure is limited to six years for fellows not holding a university or college office.

About half of the total number of undergraduates have rooms in college; the remainder reside in lodgings, but under the same rules as to discipline. Residence is usually commenced in the October term. The undergraduate in his first year of residence is called a 'Freshman'; in his second year, a 'Junior Soph'; in his third year, a 'Senior Soph.'

The whole business of the university was originally transacted in the most easterly of the two quadrangles that now compose the Library. In

1722-30 the Senate-house was built, and the old Regent-house, which occupied the first floor of the north side of the quadrangle, was thus added to the Library. The continual need of the Library for increased space has led to large additions from time to time. The Library now contains about 1,000,000 volumes and MSS. Under the Copyright Acts it enjoys the right of receiving on demand a copy of every book published in the country. It is distinguished among the great libraries of Europe for the freedom of access to the shelves permitted to readers. The chief treasure amongst the MSS. is the 'Codex Bezae,' or 'Cantabrigiensis,' presented to the university by Theodore Beza in 1581. This is a copy of the Gospels and Acts of the Apostles of about 500 A.D., with the Greek and Latin versions written on opposite pages.

The Senate-house, which stands in a conspicuous position facing St Mary's Church, is used for congregations of the senate, for the giving of degrees, for university examinations, and the like.

The Fitzwilliam Museum is the finest of the modern additions to the university. Viscount Fitzwilliam bequeathed in 1816 £100,000 New South-sea Annuities, the interest of which was to build and support a museum. He left also a very valuable collection of books, paintings, prints, &c. G. Basevi was the architect, but died before the building was completed. The Marlay bequest of works of art (1912) made an extension necessary. Near the Fitzwilliam Museum is the Museum of Classical Archaeology, which contains the best collection of casts from the antique in Britain. The collections of the Cambridge Antiquarian Society are now in the new Museum of Archaeology and Ethnology. The Pitt Press is a church-like structure, built in honour of Mr Pitt in 1831. It contains a part of the university printing-offices. The Observatory, which is situated about a mile from Cambridge, contains some very fine instruments, amongst which is a large equatorial telescope presented by the Duke of Northumberland in 1835. The Solar Physics Observatory, transferred from South Kensington in 1913, is combined with the former astrophysical department of the university. The large group of buildings known as 'The Museums and Lecture Rooms' is devoted to the study of natural science. The most important departments are: (1) the Medical School; (2) the Museum of Zoology and Comparative Anatomy; (3) the Department of Biochemistry; (4) the Anatomy School; (5) the Mineralogical Museum; (6) the Chemical Laboratory; (7) the Cavendish Laboratory of Experimental Physics, the munificent gift of the Duke of Devonshire, chancellor of the university; (8) the Museum of Archaeology and Ethnology; (9) the Botany School; (10) the School of Agriculture; (11) the Molteno Institute of Parasitology; (12) the Physiological Laboratory; (13) the Psychological Laboratory; (14) the Sedgwick Museum of Geology, containing the original collection of Dr John Woodward. The new Engineering Laboratory is near Leys School. The Botanic Garden is farther south.

A particular notice of each college will be found below in its alphabetical place.

[AYERST HALL, a hostel, founded in 1884 to provide an economical education for theological students and others, became extinct in 1896.]

ST CATHARINE'S COLLEGE, long called St Catharine's Hall, was founded by Robert Wodelarke, provost of King's College, in 1473. John Bradford the martyr, Archbishop Sandys, John Ray the naturalist, and two liberal benefactors to the town and university—William Worts and John Addenbrooke—belonged to this college. The present buildings are of the 17th and 18th centuries, the master's lodge being added in 1875.

[CAVENDISH COLLEGE, established in 1873 by an association, was opened in 1876, became a public hostel in 1882, but was closed in 1891. It was sold in 1893 to the Congregational Board of Education for a preparatory educational institute.]

CHRIST'S COLLEGE was originally founded as a school in 1439, under the name of God's House. It was enlarged and refounded as Christ's College in 1505 by Margaret Beaufort, mother of Henry VII. She was also the foundress of St John's College. Among famous members of this college were Leland, Latimer, Milton, Edward King (Lycidas), Paley, and Darwin. The buildings are substantially the same as those built by the foundress and her executors who carried out her plan, but they have been from time to time modernised, and now have an Italian character.

CLARE COLLEGE, founded 1326, under the name of University Hall, by Richard Badew, was refounded in 1338 by Elizabeth, Countess of Clare. Richard III., pretending to be descended from the foundress, claimed the patronage of this hall. Chaucer calls it 'Solere' Hall. The buildings, which are in Jacobean style, are amongst the most pleasing in the university. The college hall, rebuilt in 1693, is described by Steele (*Spectator*, No. 78). Tillotson, Cudworth, Whiston, and Nicholas Ferrar were members.

CORPUS CHRISTI, or BENET COLLEGE, was founded by two guilds of townspeople—the guild of Corpus Christi and the guild of the Blessed Virgin Mary. They had had separate halls, and respectively worshipped at the churches of St Benedict and St Mary. They united in 1352, and a small college was erected by them. Among the members have been Archbishops Parker and Tenison, Sir Nicholas Bacon, Marlowe, Fletcher, Richard Boyle, Earl of Cork, and the antiquary Richard Gough. The original buildings exist with little alteration, but many additions have been made. St Benedict's Church, the oldest in Cambridge, was long used as the college chapel. In 1579 a chapel was built within the college, with a room over it to contain the very valuable library of books and MSS. left to the college by Archbishop Parker. In the event of a certain number of the MSS. being lost, the collection was to pass over to Caius College, and thence, under similar circumstances, to Trinity Hall. The MSS. are guarded with jealous care, and none have as yet been lost.

DOWNING COLLEGE.—Sir George Downing in 1717 left estates to endow a college after the death of his immediate successors. It ought to have been founded in 1764, but owing to opposition and litigation, the charter was not obtained till 1800.

EMMANUEL COLLEGE was founded in 1584 by Sir Walter Mildmay, on the site of a Dominican house. John Harvard, the founder of Harvard University, belonged to Emmanuel; also Archbishop Sancroft, Sir William Temple, and Dr Samuel Parr. The present chapel was designed by Wren. There are good pictures in a gallery attached to the master's lodge, and valuable MSS. in the library.

GONVILLE AND CAIUS COLLEGE was founded in 1348, under the name of Gonville Hall, by Edmund Gonville. In 1353 William Bateman, his executor, moved it to the present site, and changed the name to the 'Hall of the Annunciation of Blessed Mary the Virgin.' In 1558 John Caius, M.D. (q.v.), refounded the hall under the name of Gonville and Caius. It is now usually called simply 'Caius' (pronounced *Keys*). On account of the Tancred medical studentships, this has always been the chief medical college of the university. Among eminent members have been J. Caius, Harvey, Dr Wollaston, Jeremy Taylor, Sir J. Gresham, and Bishop Mackenzie. The buildings are large and handsome, and the parts erected by Dr Caius carefully

planned for health and beauty. The large and picturesque gateway leading to the senate-house, called the Gate of Honour, was built from the designs of Caius after his death. In modern times large additions have been built to the college.

JESUS COLLEGE was founded by John Alcock, Bishop of Ely, in 1496. Henry VII. granted for the purpose the nunnery of St Radegund. Among its members have been Cranmer, Fisher, Bishop of Rochester, Sterne, and Coleridge. The old buildings are beautiful, especially the chapel, originally the church of the nunnery, but adapted by Alcock. It was injured at the time of Cromwell's occupation of Cambridge in 1643, when a certain William Dowling committed ravages on many of the college chapels. It was repaired at the Restoration, and was carefully restored (1846–49) under the direction of Pugin.

ST JOHN'S COLLEGE is derived from the oldest foundation in Cambridge, for it is on the site of a small hospital for the sick founded by Henry Frost in 1135, and dedicated to St John the Evangelist. It was under the management of Augustinian friars. Hugh de Balsham tried to attach his secular scholars to the religious foundation, but he was unable to secure harmony, and he therefore founded Peterhouse. In 1510 the hospital was converted into the college of St John the Evangelist, in accordance with the will of Lady Margaret Beaufort, mother of Henry VII., who also founded Christ's College and a professorship of Divinity. Henry VIII. appropriated to himself nearly all the estates left by his grandmother to the college, and gave it some smaller estates in compensation. St John's has, however, grown by numerous gifts, and is now second only to Trinity in size and wealth. Among many eminent members may be mentioned Ascham, Burleigh, Ben Jonson, Falkland, Fairfax, Strafford, Prior, Herrick, Richard Bentley, William Wilberforce, Wordsworth, Kirke White, Palmerston, and Samuel Butler. The buildings are very picturesque, chiefly in Tudor and Jacobean styles. They lie on both sides of the river, which is crossed by a bridge somewhat resembling the Bridge of Sighs. A new chapel, designed by Sir G. G. Scott, was opened in 1869. It is in the Early Decorated style, is richly adorned with marbles and carving, and has a lofty and massive tower. The library contains many valuable MSS., and specimens of early printing. There are interesting portraits in the hall and master's lodge.

KING'S COLLEGE was founded in 1441 by Henry VI. His first intention was to endow a small foundation, but he enlarged his plans and connected the college with Eton, from which the scholars were to be transferred, as in the case of Wykeham's colleges at Winchester and Oxford. The buildings were designed on a large scale, but only the chapel was built in accordance with the king's plan. It is the finest specimen in England of the Perpendicular style, and was not finished till about 1536. The fretted roof is a wonderful work of art, being made of great blocks of stone fitted together and balanced on the piers below. The painted glass is fine, and dates from the beginning of the 16th century, except the west window, which was finished in 1879. The other college buildings were originally on the north side of the chapel. The gateway which alone survives is now incorporated with the western quadrangle of the university library. The scholarships were formerly appropriated to scholars of Eton, and no examination was necessary to take a degree, but in 1853 students of King's were admitted to the Tripos examinations; 24 of the 48 scholarships have also been thrown open. These changes have had an admirable effect on the college, and it has greatly

grown in size and influence. Pearson, Waller, Horace Walpole, Walsingham, Karl Pearson, Sir W. Raleigh, and Rupert Brooke were members.

MAGDALENE COLLEGE (pronounced *Maudlin*) was founded in 1542 by Lord Audley on the site of a hostel for Benedictine students, which had been established in 1428, and was given to Lord Audley at the suppression of monasteries. The appointment of the master is still in the hands of the possessor of Audley End as Lord Audley's representative. Among eminent members were Archbishops Grindal and Usher, Samuel Pepys, and Charles Kingsley. Pepys left his valuable library to the college, on condition it was kept intact and separate, and that it should pass to Trinity College if these conditions were broken. The buildings are old, but not of special interest. The chapel, restored in 1847, is of uncertain date. The hall was built in 1519 by the Duke of Buckingham.

PEMBROKE COLLEGE was founded in 1347 by Mary de St Paul, whose husband, Aymer de Valence, Earl of Pembroke, was slain at a tilting match held in honour of her nuptials. Among the members of the college were many bishops, including Andrewes, Ridley, and Wren; the martyrs Bradley and Rogers; Spenser, Crashaw, Gray, and Mason; also William Pitt. The buildings are in part very old, but much rebuilt and restored. The chapel was built by Bishop Wren, in fulfilment of a vow made by him when imprisoned in the Tower, during the Commonwealth, and the architect was his nephew, Sir Christopher Wren.

ST PETER'S COLLEGE, or PETERHOUSE, founded as a hospital at an earlier date, was converted by Hugh de Balsham into an institution 'for studious scholars' in 1280-86. The present chapel was opened in 1632. Parts of Peterhouse are the oldest collegiate buildings in Cambridge. The hall and combination room have been admirably restored. The poet Gray belonged to this college, but migrated to Pembroke, as Crashaw had migrated from Pembroke to Peterhouse. Archbishop Whitgift, Isaac Barrow (afterwards Master of Trinity), Lord Kelvin, and P. G. Tait were members.

QUEENS' COLLEGE was founded in 1448 by Margaret of Anjou, wife of Henry VI., and re-founded in 1465 by Elizabeth Woodville, wife of Edward IV. Among the names of interest connected with this college, are those of Fisher, Bishop of Rochester and first president, Fuller the antiquary, and Erasmus, who occupied rooms in this college when he came to Cambridge by Fisher's invitation to teach Greek. His rooms are pointed out in the court which is called after him. The buildings are among the most interesting in Cambridge. They were begun in 1448, and have suffered less from modern meddling than in most of the colleges. There are four courts, and the principal one is entered by a massive gateway with octagonal towers at the corners; there is also a square tower at each external angle of the court. The old chapel suffered at the hands of enemies and friends, but was carefully restored in 1861, and is now a lecture room and library. There are interesting portraits in the hall, combination room, and president's lodge.

SELWYN COLLEGE, founded in 1882, was built by public subscription in memory of George Augustus Selwyn, late Bishop of Lichfield, and formerly Bishop of New Zealand. The aim of the college is to supply an economical university education, based upon the distinctive principles of the Church of England.

SIDNEY SUSSEX COLLEGE was founded on the site of a suppressed religious house granted by Henry VIII. to Trinity. Lady Frances Sidney, widow of the Earl of Sussex, left money for the foundation of a college to be called by her name. Her executors obtained the site from Trinity, which

still receives an annual rent from Sidney of £13, 6s. 8d. Oliver Cromwell entered at Sidney College, but left without taking a degree. The college possesses an admirable picture of him attributed to Samuel Cooper, which it received in 1766 from an anonymous donor, afterwards ascertained to have been Mr Thomas Holles.

TRINITY COLLEGE is larger than any other in either Oxford or Cambridge. It was founded in 1546 by Henry VIII., and was formed by the union and extension of several earlier foundations occupying different parts of the site of the college. Amongst these may be mentioned: (1) Michael-house, founded in 1324 by Hervey de Stanton; (2) King's Hall, founded by Edward III. in 1337. Queen Mary added twenty scholarships and began the college chapel. Architecturally the college may be said to date in its present form from the mastership of Dr Thomas Neville (1593-1615). Neville completed the great court, rebuilt the hall, began the court which now bears his name, and erected the fountain in the great court. The library was begun in 1676, after the designs of Sir Christopher Wren. It is of remarkably fine proportions, and contains a very valuable collection of books and manuscripts. During the nineteenth century the chief additions were the New Court (finished in 1825), and Whewell's Courts, which were completed in 1868, and form a splendid monument of Dr Whewell's munificence towards his college. Whewell's buildings, however, in consequence of the form of the site, are somewhat cramped for architectural effect. The interior of the chapel, which till recently was bare and unattractive, has been elaborately restored and decorated (1870-75). The grounds and gardens are of great beauty, especially the fellows' garden and bowling-green.

The Crown appoints the master, and also possesses apartments in the master's lodge which are occupied by His Majesty's judges when on circuit. The college has produced a long series of eminent men, who are commemorated by fine statues and busts in the ante-chapel and library, and by some pictures, mostly very bad, in the hall. The following may be mentioned: Lord Bacon, Sir Edward Coke, Cowley, Lord William Russell, John Dryden, Sir Isaac Newton (fine statue in ante-chapel by Roubilliac), Bentley, Porson, Byron (fine statue by Thorwaldsen in library), Macaulay (statue in ante-chapel), Sedgwick, Julius Hare, Tennyson, A. H. Hallam, Thackeray, W. H. Thompson, Lord Houghton, FitzGerald, the Duke of Devonshire, Jebb, Clerk Maxwell, Galton, and Sir George Trevelyan.

It may be useful to explain that for boating purposes the college has been divided into three clubs—viz. First, Second, and Third Trinity. Second Trinity (now extinct) consisted of scholars and sizars. Third Trinity is confined to those who come from Eton and Westminster. First Trinity includes the remainder of the college.

TRINITY HALL was founded in 1350 by William Bateman, Bishop of Norwich (one of the three founders of Caius College), for the study of civil and canon law. The buildings are in nowise remarkable, but the library contains a good collection of law-books. Bishop Gardiner, Lord Chesterfield, Bulwer Lytton, and Sir Leslie Stephen were members.

Girton (q.v.) and Newnham (q.v.) Colleges for ladies, and the English Presbyterian *Westminster College* (transferred hither from London in 1899) are no part of the university.

See the annual *Cambridge Calendar*, the *Student's Guide to the University of Cambridge*, the *Cambridge Almanac* (for athletics, college societies, &c.), *Dickens's Dictionary of Oxford and Cambridge*, and *Valkinson's Cambridge Described*. For the several colleges, see *The Cambridge College Series* (1898 et seq.). For all matters

relating to the buildings of the university and the colleges, and for much general history, see Willis and Clark, *The Architectural History of the University of Cambridge* (4 vols. 1886); for the history, biography, and antiquity, see Fuller's *History of Cambridge*; Dyer; Caius; Le Keux' *Memorials of Cambridge* (3 vols. 1880); Cooper's *Annals* (1842-1908); Cooper's *Athenæ Cantabrigienses*; *Graduati Cantabrigienses*; Cooper's *Memorials of Cambridge* (1860); Ackermann's *History of the University of Cambridge* (1815); Huber's *English Universities* (trans. F. W. Newman, 1843); H. Gunning's *Reminiscences of Cambridge from the Year 1780* (2 vols. 1854); W. Everett's *On the Cam* (1866); C. Wordsworth's *Social Life at the English Universities in the Eighteenth Century* (1874); J. Bass Mullinger's *The University of Cambridge* (3 vols. 1873-1911); Rashdall's *Universities of Europe* (1895); the Dean of Ely's *Cambridge and its Story* (illustrated by Railton, 1904).

Cambridge, a city of Massachusetts, virtually a suburb of Boston, from which it is separated by the Charles River, is principally distinguished as the seat of Harvard University (q.v.), and as the home of Longfellow, Lowell, Wendell Holmes, and many other men of letters. Cambridge was first settled in 1630, and is therefore one of the oldest towns in New England. It early became noted for its printing industry, the first book published in the British American colonies (the Bay Psalm-book) having been printed here in 1640. Indeed, the manufacture of books is now one of its leading industries; besides which there are large manufactories of furniture, glass, ironware, tinware, bricks, chemicals, net and twine, sugar, soap, and rubber. Within the limits of the city are comprised the different localities of Old Cambridge, or Cambridge proper, which is distinctively the seat of the university; East Cambridge or Lechmere Point, a manufacturing district; Cambridgeport, where is located the city hall, numerous churches, several banks, a convent, and some manufactories; and North Cambridge. The cemetery of Mount Auburn is partly in Cambridge. Pop. (1870) 39,364; (1920) 109,694. See BOSTON.

Cambridge, GEORGE WILLIAM FREDERICK CHARLES, DUKE OF (1819-1904), was born at Hanover, the only son of George III.'s seventh son, Adolphus Frederick (1774-1850), who was created first duke in 1801. He held a command at Alma and Inkermann; in 1862 was made a field-marshal; and from 1856 to 1895 was commander-in-chief. He married an actress, Miss Farebrother, their children bearing the name Fitzgeorge.

Cambridge Platonists. See LATITUDINARIANS.

Cambridgeshire, with the Isle of Ely, is 48 miles long, 11½ to 33 broad, and 864 sq. m. in area; 92 per cent. is arable land, meadow, and pasture, the rest fens. The surface, except in the south, which is somewhat elevated and on the chalk formations, is flat and thinly wooded, with villages and churches here and there on slight elevations called 'eys' or islands. In a country less level the much-vaunted Gog-Magog Hills, 4 miles SE. of Cambridge, would escape observation. At Upware are beds of the phosphatic nodules called Coprolites (q.v.), which are of great value as an artificial manure. The northern portion of Cambridgeshire forms part of the Bedford Level (q.v.). The chief of the sluggish rivers are the Ouse, which crosses the middle of the county from west to east, with its tributary the Cam; the Nene, which borders the county on the north; and the Lark. These are all navigable to a certain extent. Cambridge is an agricultural county. In the higher parts the land produces fine crops of beans and wheat. Many cattle and sheep are now supported on the thin chalky soils. The black spongy soil of the fens consists of mud mixed with decayed vegetable matter, and when drained and burned, pro-

duces, in dry years, heavy crops of cole-seed, wheat, oats, barley, hay, potatoes, hemp, and flax. Horses, cattle, and sheep are also reared in the fens. The Isle of Ely, part of the fen-tract, and within the Bedford Level, is famed for garden vegetables, and the meadows of the Cam yield fine butter and cream-cheese. The chief towns of Cambridgeshire are Cambridge (the county town), Ely, Wisbeach, March, Thorney, Linton, Soham, Newmarket, and Royston. The manufactures of Cambridgeshire are mostly such as belong to an agricultural county. Till 1918 Cambridgeshire returned three members to parliament. It now returns one. Pop. (1801) 89,346; (1871) 186,906; (1921) 203,372, including 73,778 in the administrative county of the Isle of Ely. Cambridgeshire was anciently the seat of a powerful tribe—the Icenii. It was crossed by several British and Roman roads, in some parts now covered by several feet of peat-soil. Remains of Roman camps, sea embankments, and villas occur, and Roman antiquities, as coins and urns, have been found. Of four great dykes or earthworks the chief is the Devil's Ditch, extending 7 miles south-eastward from Reach to Wood-Ditton. It is 18 feet high on the east side, and was certainly of pre-Roman workmanship, as it is cut through by Roman roads. In the 9th and 10th centuries Cambridgeshire was the scene of severe contests between the Danes and English. The Isle of Ely and its monks withstood William the Conqueror for three years (see HEReward). Cambridgeshire, and especially the Isle of Ely, suffered much in the civil wars of Stephen, John, Henry III., and Charles I. There formerly existed thirty-six religious houses in Cambridgeshire. See Arthur G. Hill's *Cambridgeshire* (1882), Babington's *Ancient Cambridgeshire* (1883), and Conybeare's *History* (1898).

Cambuscan, a prince of Cambaluc (Peking), whose name is a corruption of Genghis Khan, while the description applies apparently to his grandson, Kublai Khan. Cambuscan was Milton's form of the Cam'bynskan' of Chaucer's fragment of a metrical romance, *The Squires Tale*. The lines in *Il Penseroso* (109-15) will be remembered:

Or call up him that left half-told
The story of Cambuscan bold,
Of Camball, and of Algarsife,
And who had Canace to wife,
That owned the virtuous ring and glass,
And of the wondrous horse of brass
On which the Tartar king did ride.

Spenser adds to the tale in his *Faerie Queene* (IV., ii. and iii.); and John Lane, a friend of Milton's father, wrote a continuation of it. Some of the romantic elements in it are widespread in oriental story, occurring in the *Arabian Nights*, the *Panchatantra*, and elsewhere. See Clouston's *Popular Tales and Fictions* (1887).

Cambuslang, a large mining village of Lanarkshire, 4 miles SE. of Glasgow. Here a revival, known as the 'Camb'lang Wark,' was held, under Whitefield, in 1741.

Camby'ses (*Cambujyja*), second king of the Medes and Persians, was the son of Cyrus, and succeeded his father in 529 B.C. He put his brother Smerdis to death, and in 527 or 525 invaded Egypt, defeated its king Psammenitus at Pelusium, and in six months made himself master of the whole country. He meditated further conquests, but the Tyrian mariners refused to serve against Carthage; an army which he sent to take possession of the temple of Ammon perished in the desert; and one which he led in person to Nubia purchased some conquests dearly at the price of myriads of lives. Camby'ses, according to Sayce, was conciliatory on the whole towards the Egyptians; but latterly he gave himself up to drunkenness and hideous cruelties, when news came, in 522, that Gaumata,

a Magian, had assumed Smerdis' character, and seized on the Persian throne. Cambyzes marched against him from Egypt, but died on the way in Syria from an accidental wound in the thigh.

Camden, a city and port of entry of New Jersey, and capital of Camden county, stands on the left bank of the Delaware River, opposite Philadelphia, with which it is connected by five steam-ferries. It is the terminus of six railways, and has several shipyards and dry-docks, important foundries, cotton and woollen mills, and large manufactures of machinery, ironwares, paints, oil-cloths, &c. Pop. 116,000.

Camden, CHARLES PRATT, EARL, a younger son of Sir John Pratt, who was Chief-justice of the Court of King's Bench in the reign of George I., was born in 1713. Educated at Eton and Cambridge, he was called to the bar in 1738, but not until 1752, when he defended a bookseller successfully against a government prosecution for libel on the House of Commons, did his prospects appear very promising. He was appointed Attorney-general in 1757, and Chief-justice of the Common Pleas in 1762. Judge in the trial of Wilkes, he declared his opinion emphatically that the action of government in this case, by general warrants, was altogether illegal—an opinion which, chiming in with public sentiment at the time, made him the most popular of judges. In 1765 he was created Baron Camden by the Rockingham administration, to whose ill-advised American policy, and to that of their successors, as well as to their treatment of Wilkes, he, notwithstanding, offered constant opposition. He was made Lord Chancellor in 1766, but his consistent principles on these two subjects led to his resignation in 1770. His judicial career ended here; henceforth he was entirely a political character. He filled the office of President of the Council in the second Rockingham cabinet in 1782, and also, under Pitt, from the following year until his death, April 18, 1794. He was created Earl Camden and Viscount Bayham in 1786.

Camden, WILLIAM, scholar, antiquary, and historian, was born in London, where his father was a painter, 2d May 1551. His education, commenced at Christ's Hospital, was completed at St Paul's School and at Oxford. In 1575 he was appointed second master of Westminster School; and it was while discharging the duties of this office that he undertook the work which has made his name famous, his *Britannia*, a survey of the British Isles. Written in elegant Latin, it was first published in 1586, and at once brought him into communication with the learned men of his time. In 1607 the work reached a sixth edition, being greatly enlarged and improved by the indefatigable industry of the author. The book, at first but a comparatively small single volume, has received much additional matter from other writers. It was first translated by Philemon Holland, and the latest and best translation is that by Gough and Nichols (2d ed. 4 vols. 1806). Of this great work of Camden, Bishop Nicolson said it was 'the common sun whereat our modern writers have all lighted their little torches.' In 1593 Camden was appointed head-master of Westminster School; and four years later he was made Clarendieux King-at-arms, an appointment which gave him more time for the pursuit of his favourite studies. His other most important works, all in Latin, are a list of the epitaphs in Westminster Abbey (1600), a collection of old English historians (1603), a narrative of the trial of the Gunpowder plotters (1607), and *Annals of the Reign of Elizabeth to 1588* (1615). He died in his house at Chislehurst (it was afterwards Napoleon III.'s) on 9th November 1623, at the age

of seventy-two, and was buried in Westminster Abbey. He endowed a professorship of history at Oxford. The 'Camden Society' was founded in his honour in 1838 for the publication of early historical remains.

Camel (Lat. *camēlus*; Heb. *gāmāl*), a genus of even-toed ruminant Ungulates (Artiodactyla, Ruminantia), and type of a small family—Camelidae or Tylopoda. In this family the dentition is peculiar, for of the three front teeth present in the young only one (the third) generally remains and looks like a canine; the upper lip is hairy and deeply cleft; the neck is very long, though the number of vertebræ remains as usual seven; the feet (with two toes) are not enhoofed, but provided with callous soles. Fig. 1 represents the bones of the lower part of fore-leg, showing the two toes and slightly divided metatarsal bones. The stomach has three compartments, the manyplies or psalterium being absent; the placenta is diffuse. The family includes two genera—the Camels proper (*Camelus*) and the various forms of Alpaca (q.v., Auchenia). The camels are well known for their large size, for their dorsal humps, for their callosities on knees, breast, &c., for the common sole uniting the two toes. The ears are small and rounded; the short tail bears a terminal switch; the hair is tangled and felted; the male may protrude a curious pouch from the skin of the mouth at the reproductive season; the period of gestation is prolonged for eleven to thirteen months; a single young one is born; the diet is wholly vegetarian. Camel's blood has oval corpuscles (see BLOOD).

One species (*C. dromedarius*) is usually spoken of as the dromedary, though the title properly belongs only to a special breed. It has a single hump and a generally reddish-gray colour. This familiar 'ship of the desert' has its home in Arabia, is bred in West Asia and North Africa, and is literally indispensable to the Arabs. There are many breeds, and the dromedary *par excellence* is the most agile of these. Apart from its use in transit and transport, the flesh is eaten, the milk made into butter and cheese, the hair woven into fabrics of various degrees of fineness, the skin tanned, the dung burned as fuel; the soot of the burnt dung was formerly a source of sal-ammoniac. The dromedary is found as far east as India, whence twenty-four were imported into Australia for Burke and Wills's exploration (1860); in Western Australia alone about 4000 were in use for various purposes in 1896, and about 6000 in 1921. It has also been introduced into parts of North America, and even into Europe. The other camel is technically known as *C. bactrianus*, and is distinguished by its slightly larger size, two dorsal humps, and somewhat finer brown or reddish hair. This camel is bred in Central Asia, and in its adaptability to domestication, as well as in its natural adaptation to desert life, is a most useful animal. Its frugal diet, its powers of storing water and of going long without a fresh supply, and its great strength, are very familiar facts. The sole uniting the toes, the callosities on chest and joints, the long sheltering eyelashes, the closable nostrils, the capacious water-pouches of the stomach (for the sake of which the Arabs at a pinch are said to sacrifice the camel), the reserve-supply of fat in the humps, the acute senses of sight and smell, are all interesting items in the adaptation of the camel to its life and work. The animal is peculiarly hardy, and can pass the rigours of a Siberian winter without apparent

Fig. 1.

discomfort. Its coat becomes longer in winter. The shaggy undersized camels that drag sleighs over the deep snow of the Kirghiz steppes are very unlike their more southern relations. A camel will eat

Fig. 2.—Camel (*Camelus bactrianus*).

almost any herbage or green thing it comes across, even dried leafless twigs. The soles of the feet wear into the quick; and Gilmour (in his *Mongolia*) tells us that they have often to be patched with leather, fastened by thongs drawn through the callosities. The hair of the camel forms the wool and cotton the warp of the famous Persian camel's-hair cloth. The so-called camel's-hair brushes are made of hairs from the tail of the sable or of some kinds of squirrel. Coarser camel's wool or hair is imported for various purposes.

The Bactrian camel can carry 1000 lb. weight or more, and the dromedary

Fig. 3.—Part of the inside of Stomach-paunch of Camel, showing the water-cells.

proper can cover 100 miles in a day. The ordinary jog of a camel is about 2½ miles an hour, but this can be kept up for many days with little food and less drink. A swift dromedary may go 10 miles an hour. A thousand or more may journey in a caravan, and the amount of food carried is surprisingly small. The hump must be in good condition before starting. Sir Samuel Baker says an Arabian camel carrying a load of 400 lb. requires water every third day, or every 90 miles, though they should be watered daily, if possible; but in cold weather, or when not at work, they can remain much longer without any water. If not watered for three days, however, many suffer, unless specially trained. In the stomach-reservoirs a gallon and a half can be stowed away. Like some other frugal animals, the camel enjoys a long life of thirty or forty years. The swinging and jolting gait of the camel renders riding it (on a sort of platform on the hump) a severe ordeal for the uninitiated. The camel's burden is usually disposed on both sides of its back. The Kirghiz yoke camels to a kind of cart; and in Orenburg and elsewhere yokes of four camels may be seen ploughing.

In disposition the camel is peculiarly stolid, not to say stupid. Whether domestication has been too much for it, there can be no doubt that its 'docility' is more the result of habitual nonchal-

ance than any outcome of intelligent subservience. It is usually very submissive, except when habitually thwarted or ill-treated, and during the breeding season; but it is often obstinate and vindictive. 2.

Large fossil camels have been dug out from the Tertiary strata of the Siwalik Hills of India, and from the Quaternary deposits of Algeria. Professor Cope has traced a long line of descent from the Miocene *Poebrotherium* to the modern forms, and primitive forms have been described by Marsh and others from the Eocene strata. The former distribution of the family seems to have been much wider than the natural habitat of the forms now extant. The camel is often mentioned in Scripture, and appears on the sculptures of Assyria. Napoleon used camels for military purposes in Egypt; a camel corps is part of the Egyptian army. Prievalsky reported wild camels from the deserts east and north of Lob Nor in Chinese Turkestan; and Sven Hedin found them in the same region. They closely resemble the domesticated Bactrian camel, and are probably its descendants.

Camel, a caisson-like apparatus for rendering a vessel navigable in shoal water. It was invented by the Russian engineer De Witte (1790-1854). See CAISSON.

Camelford, a quaint little Cornish town, near the source of the Camel ('crooked brook'), 15 miles W. of Launceston. Within 3 miles is the traditional scene of Arthur's last battle.

Camelina. See GOLD OF PLEASURE.

Camellia, a genus of Theaceæ or Ternstroemiaceæ (q.v.), named after Kamel, a Moravian Jesuit, who in 1639 collected plants in the Philippine Islands. The species are all oriental evergreen shrubs, and have long been cultivated in China and Japan, chiefly on account of the singular beauty of their flowers. The best known and most esteemed of these is *C. japonica*; in the wild state this has

Camellia japonica, or *Thea Camellia*.

red flowers, recalling those of the wild rose; and in cultivation it yields new florists' varieties from seed, and also furnishes a stock on which to graft them. It was introduced into Europe by Lord Petre in 1739; but double varieties were only brought from China from 1792 onwards: many have also been raised by European florists, and the multitude of beautiful hybrids and varieties is now endless. Camellias may be propagated also by cuttings or layers, as well as by grafting or inarching. The soil suitable is a loose black mould.

which may be prepared by mixing a little sand and peat with loam; and they must be watered liberally, yet with caution to avoid excess. The pruning also, which is performed in spring immediately after flowering, requires judgment, since it must be tolerably close, yet avoid extreme severity. In China and Japan the *camellia* is cultivated in the open air; and in the very similar climate of the Channel Islands this is also possible. In the south of England some of the hardier varieties can be trained on walls in sheltered localities with a little protection in winter; they may also be grown as window-plants, yet for practical purposes of cultivation on any adequate scale, a greenhouse is required. Care, however, must be taken to avoid much heat, else the flower-buds will drop off. From the hardy and beautiful *C. reticulata* not a few of the varieties now in cultivation are partly derived.—*C. Sasangua* and *drupifera* are cultivated in China for the sake of the wholesome oil expressed from their seeds, which much resembles olive-oil. The fragrant flowers of *C. Sasangua* (*Sasangua Tea*) are used for flavouring certain kinds of tea. Like other species its leaves also afford a kind of tea; in fact many botanists unite *Camellia* with *Thea*. See *TEA*.

Camelopard (*Camelopardalis giraffa*), an old name for the giraffe, which recalls the curious old notion that certain strange animals originated very simply by crossing. The giraffe was supposed to spring from the camel and the leopard (*pardalis*). See *GIRAFFE*.

Camelot, a name applied in the medieval romances to the splendid 'City of Legions' which grew up out of the permanent quarters of the Second Augusta Legion at Caerleon-upon-Usk (q.v.), but was built earlier by the mythical Belinus. The name is familiar to readers of Tennyson.

Camel's Thorn (*Alhagi*), a genus of Leguminosæ (q.v.). The species are herbs or undershrubs, and chiefly inhabit the deserts of the East, where they are of great importance as affording food for camels. Several species, notably the herbaceous *A. camelorum*, yield a kind of oriental manna, which appears in the form of drops, as of honey, on the leaves, and gradually hardens. It is imported into India from Kabul and Kandahar. See *MANNA*.

Cameo. A cameo is an engraved gem in which the figure or subject is carved in relief, in contradistinction to the other form of gem—an *Intaglio* (q.v.), in which the engraved subject is sunk or hollowed out like a seal. The latter is the more ancient form of gem, having been originally devised and used principally as a signet, whereas the cameo came to be employed for ornamental purposes and as a charm. While intaglios were commonly cut into stones of uniform colour, such as the sard, stratified agates were the medium chiefly employed for cameos, the relief being formed in one band or stratum of the agate, with a background of contrasting colour. Regarding the derivation of the name (the Italian form of which is *cammeo*), there is unusual diversity of opinion and many fanciful suggestions; but there does not appear to be any necessity for going behind the base Latin term *camæus*, the onyx, that stone being the principal material from which cameos were originally cut.

The art of cameo-cutting was not practised till after the era of Praxiteles, and it was in the courts of the successors of Alexander the Great that classical cameos were chiefly sought after. The stones used by the ancient engravers were obtained from the east, and many of them were of surprising size and perfection of form and colour. These banded agates are known generically as onyx stones; when the alternate layers are simply white and dark

neutral tint or black they are called simply onyxes; a sardonyx consists of strata of white and ruddy brown sard; in the same way we have chalcedony onyx or chalcedonyx (white and translucent gray), jasper onyx, bloodstone onyx, &c. Frequently three differently coloured layers are available to the engraver in the same stone, and these are taken advantage of to obtain the ground in one colour, the figure in a second, and wreaths or other accessories in the third. When cameo-engraving first flourished, the most artistic products were highly prized, not only for personal ornaments, but for the adornment of cups, caskets, vases, candelabra, and other objects of domestic luxury. Pateræ and other vessels were frequently worked out of a single stone, around which were engraved a whole series of figures in the most exquisite and accurate taste. A vast number of genuine antique cameos have been preserved in fine condition, and are now deposited in various famous public and private collections. Among these ancient art works several have the highest value for artistic excellence, while others are famous for size and for long and romantic histories attaching to them. One of the most celebrated in all respects is the Gonzaga or Odescalchi cameo (fig. 1), a sardonyx of three strata, measuring

Fig. 1.

6 by 5 inches, formerly in the possession of the Empress Josephine, and now preserved in the imperial cabinet at St Petersburg. It was formerly supposed to represent Ptolemy I. and his wife Eurydice; but the portraits have now been identified as those of Nero and Agrippina. Of not less artistic worth is the smaller cameo of Jupiter fighting the Titans, the work of Athenion (50 A.D.), signed in relief by the artist, preserved in the Vatican (fig. 2). For size and historical interest the two most important classical cameos are the Ste Chapelle cameo—the apotheosis of Augustus, now in the Bibliothèque Nationale, Paris, and the Gemma Augustea in Vienna.

The art of cameo-cutting was revived with the general renaissance of the arts in Italy in the 15th century, and it continued to be practised with great success till comparatively recent times, the last of the long line of famous engravers in precious stones having been Pistrucchi, who executed works of very great beauty for the English mint. The imperfect supply of fine onyxes, and the difficulty of treating hard stones, led the modern cameo-cutters in Italy and elsewhere to seek other media for their work,

and shell-cameos were by them introduced. The shells, like the stones chosen for this purpose, are such as possess layers of different colours. The

Fig. 2.

most useful are the *Bull's Mouth*, the under layer of which is red, resembling the sardonyx; the *Black Helmet*, which has a dark onyx ground; and the *Queen's Conch*, whose ground is of a pinkish hue. These shells have three strata, the undermost of which forms the ground, the figure being sculptured in the second, and the third serving to mark the hair, wreaths, armour, and other more prominent objects. The portion of shell having been prepared of the requisite size, form, and thickness by various mechanical means, it is fixed by some adhesive substance—usually rosin—to a small block of wood of such form and thickness as to be conveniently grasped by the artist in his left hand. The outline of the object or objects to be represented is then sketched with a pencil, and, in the case of portraits, is usually copied from a previous pencil-sketch on paper. The pencil-marking on the shell is then followed with a scratch-point, and the surrounding white substance is removed by means of files and graters. This latter process, which is more mechanical than the rest, is usually performed by an assistant. The artist then proceeds slowly and carefully to work out his subject by the use of smaller tools; those used at last for deepening the finer lines being scarcely larger than ordinary darning-needles. The manufacture of shell-cameos hardly ever attained to the dignity of art; and it, combined with the forgeries and frauds in spurious antiques of the latter part of the 18th century, had much influence in causing the decline and present extinction of gem-cutting.

Imitation cameos termed pastes are made in glass of different colours, the figures or subjects being formed in moulds, in soft fusible glass, by the aid of heat, and cemented to the background. Sometimes both background and subject are fused together. James Tassie (q.v.), a Scottish artist working principally in London, formed a collection of about 20,000 moulds from antique and modern gems for such pastes, and a very full collection of his productions is now in the possession of the board of trustees for the National Galleries of Scotland in Edinburgh. The engraving of relief figures on glass of two or more strata is an art allied to cameo-cutting, which is dealt with under GLASS. See also INTAGLIO.

Camera Lucida (so named in contrast to Camera Obscura, q.v.), an optical instrument constructed of various forms and for various purposes. Dr Robert Hooke invented one about 1674; whilst Dr Wollaston's (1807), intended to facilitate the perspective delineation of objects, consists of a small quadrilateral prism of glass, of which AB in the annexed figure is the perpendicular section, held in a brass frame, which is attached to an upright rod, having at its lower end a screw-clamp,

to fix it to the edge of a table. The prism being at the height of about a foot from the table, has its upper face horizontal. Two of its faces, as in the figure, are at a right angle at A; the contiguous faces make respectively with them angles of $67\frac{1}{2}^\circ$; so that the remaining obtuse angle at B contains 135° . Rays coming from an object PQ, and falling nearly perpendicularly on the first surface, enter the prism, and undergo total reflection at the contiguous surface (see OPTICS); they then fall at the same angle on the next surface, and are totally reflected again; finally, they emerge nearly perpendicularly to the remaining surface. An eye, as in the figure, then receives the emergent pencil through one part of the pupil, so that an image, *pq*, of the object is seen projected upon a sheet of paper upon the table. The rays from the drawing-pencil passing the edge of the prism, enter the other part of the pupil; and the pencil and image being seen together upon the paper, a sketch of the latter can be taken. There is, however, a practical difficulty—the image and the drawing-pencil are at distances sensibly different from the eye, and so cannot be seen together distinctly at the same time. To obviate this, a plate of metal, with a small aperture

Camera Lucida.

as an eye-hole, is placed at the edge under the eye, so that the rays through the prism, and those from the drawing-pencil, which both pass through the eye-hole, form only very small pencils. By this the difficulty is greatly diminished. It is still, however, difficult to use the instrument satisfactorily; and though many acquire great readiness in its use, others have never been able to attain the same facility. A simpler form is merely a piece of smooth glass fixed at an angle of 45° to the horizon. In this case, however, the image seen on the paper below will be inverted. In Amici's form of the instrument a right-angled triangular prism is used, involving two refractions and one reflection.

Camera Obscura (lit. 'a dark chamber'), an instrument described by Giambattista della Porta in his *Magia Naturalis* (1569). It is known in its simplest form as a familiar toy, consisting of a rectangular box, furnished at one end with a lens whose focal length is equal to the length and depth of the box; at the opposite end of which a plane reflector is placed at an angle of 45° , which throws the image of any objects to which the lens may be directed on a piece of ground-glass on the top of the box in a non-inverted position, so that they may be viewed or sketched from as in nature. The instrument received a new interest when in the hands of Daguerre it became the main instrument used in photography. For the photographic camera, see PHOTOGRAPHY.

Camerarius, JOACHIM—originally *Liebhart*, which name he changed into Camerarius, because his forefathers had been *Kammerer* (chamberlains) at the court of the Bishop of Bamberg—was born

at Bamberg, 12th April 1500, and died at Leipzig, after a life devoted to literature, 17th April 1574. His works include an excellent biography (1566) and collection of letters (1569) of his friend Melancthon; also annotations on Cicero's *Quæstiones Tusculanæ* (1525), *Commentarii Linguae Græcæ et Latine* (1551), and *Epistolæ Familiares* (3 vols. 1583-95), giving interesting notices of his times.—His son, JOACHIM CAMERARIUS (1534-98), was one of the most learned physicians and botanists of his age.—RUDOLPH JAKOB CAMERARIUS (1665-1721) was also a physician and botanist.

Camerino (ancient *Camerinum*), a town of Central Italy, on a spur of the Appenines, 41 miles SW. of Ancona. It has a cathedral on the site of a temple to Jupiter, a university (1727), and manufactures silk. Its bishopric, dating from the 3d century, was made archiepiscopal in 1787. Pop. 12,000.

Camerlengo (Ital., 'chamberlain'), the cardinal with the control of the papal treasury, who, in the days of the temporal power, administered justice, and during an interim stood at the head of the government.

Cameron, SIR DAVID YOUNG, etcher and painter, born at Glasgow in 1865, was educated there and at Edinburgh. He became a member of the Royal Academy in 1920, and was knighted in 1924.

Cameron, SIR EWAN or EVAN, OF LOCHIEL (1629-1719), fought in Glencairn's rising, 1653 (see GLENCAIRN), submitted to Monk and accompanied him south, and fought under Dundee at Killiecrankie. He submitted to William, but sent his clan to join Mar in the '15.—His grandson DONALD (c. 1695-1748), the 'Gentle Lochiel,' joined the Pretender in the '45, was wounded at Falkirk and Culloden, and fled to France, where he was given the command of a regiment.

Cameron, JOHN (c. 1579-1625), scholar and divine, was born and educated at Glasgow. In 1600 he went to the Continent and held appointments at Bergerac, Sedan, Saumur, and elsewhere. In 1622 he became principal of the university of Glasgow; but in less than a year he returned to France, becoming professor of divinity at Montauban. There, as at Glasgow, his doctrine of passive obedience made him many enemies, by one of whom he was fatally stabbed in the street. Sir Thomas Urquhart and Milton praised his learning. In biblical criticism he usually chose the opposite view to that held by other divines, especially Beza. His eight works, in Latin and French (10 vols. 1616-42), are said to be the foundation of Moses Amyraut's doctrine of universal grace (1634). His followers are sometimes called Cameronites.

Cameron, RICHARD, a Scottish Covenanter, was born in Falkland, where he became precentor and schoolmaster under an Episcopal incumbent. 'Converted by the field-preachers,' he seems to have become a tutor and then a preacher. In 1678 he went to Holland, and returned in 1680 in time to take a prominent part in publishing the Sanquhar Declaration (q.v.). Retiring then, with some sixty armed comrades, to the hills between Nithsdale and Ayrshire, he evaded capture for a month, though a price of 5000 merks was set on his head. On the 20th July 1680, however, they were surprised by dragoons in Aird Moss, near Auchinleck, and after a brave fight, Cameron was killed. His hands and head were cut off, and fixed upon the Netherbow Port, Edinburgh. See *Life* by Heikless (1896).

Cameron, VERNEY LOVETT, African explorer, was born at Radipole, near Weymouth, 1st July 1844. He entered the navy in 1857, and served in the Mediterranean, the West Indies, and the Red

Sea, and on the east coast of Africa, taking part in the Abyssinian expedition, and in the suppression of the slave-trade. In 1872 he was appointed to the command of an east-coast expedition to relieve Livingstone, and starting from Bagamoyo in March 1873, in August at Unyanyembe he met Livingstone's followers bearing his remains to the coast. After making arrangements for their safe arrival, he proceeded to Ujiji, where he found some of Livingstone's papers and a map, which he forwarded to Zanzibar. He then made a survey of Lake Tanganyika, which he found to be disconnected with the Nile system. In the belief that the Lualaba was the upper waters of the Congo, he resolved to follow its course to the west coast; but owing to the hostile interposition of the native chiefs, was prevented from verifying a conviction, the correctness of which was demonstrated by Stanley in 1877. Taking a more southerly route, he reached the Portuguese settlement of Benguela, on the west coast, 7th November 1875, whence he returned to England. A C.B. and Commander, in 1878 he explored the route for a Constantinople-Bagdad railway to India; and in 1882, with Sir Richard Burton, he visited the Gold Coast. He died, through a hunting accident, at Leighton Buzzard, 26th March 1894. Among his works are *Across Africa* (1877), *Our Future Highway to India* (1880), and several boys' books.

Cameronian Regiment, since 1881 Cameronians (Scottish Rifles), long the 26th infantry Regiment, had its origin in a body of Cameronians (1689). Taking advantage of their zeal and courage, the Convention which sat at Edinburgh induced a number of them to assist in the Revolution, which it was imagined by some was to re-establish the reign of the Covenant. They were induced to enlist on the understanding that the special object of the corps was 'to recover and establish the work of Reformation in Scotland, in opposition to popery, prelacy, and arbitrary power, in all the branches and steps thereof, till the government in church and state be brought to that lustre and integrity which it had in the best of times.' Thus was formed the celebrated Cameronian Regiment, with the youthful Lord Angus as colonel, and for lieutenant-colonel and actual commander, William Cleland, the poet, by whom, ten years before, Drumclog had been mainly won. Under him, not yet in his 30th year, the regiment was sent northwards to quell the insurrection, after the fall of Claverhouse at Killiecrankie. Surrounded by 5000 Highlanders, the Cameronians, only 1200 strong, gallantly defended themselves during a whole day in Dunkeld, 21st August 1689. Cleland fell early in the fight, but his work was accomplished, for, in Macaulay's words, 'the Cameronians had finished the war.' The regiment has ever done credit to its origin, being distinguished alike for gallantry and for good conduct.—The Cameron Highlanders, long known as the 79th Foot, are of course a distinct regiment.

Cameronians, the religious body in Scotland popularly named after Richard Cameron (q.v.), but officially called Reformed Presbyterians. No doubt the principles of the body are those for which Cameron contended and died. In 1681 societies were organised bearing the names of the districts to which they belonged, such as Teviotdale, Nithsdale, Clydesdale, for the purpose of defence against the oppression of the government, and for the maintenance of worship. They published in 1687, as their first testimony, 'The Informatory Vindication,' declaring their adherence to the principles and position of the Church of Scotland during the period between 1638 and 1649. In this document they expressly state, 'we positively disown, as

horrid murder, the killing of any because of a different persuasion or opinion from us, albeit some have cast this odious calumny against us.' Not till after 1688 did the small body of Presbyterians, who insisted upon this restoration of the civil and ecclesiastical polity of 1638 to 1649 in opposition to the Revolution settlement, become a separate church. According to the Solemn League and Covenant, ratified by the parliaments of England and Scotland, and also by the Assembly of Divines at Westminster in 1643, Presbyterianism was to be maintained in the kingdoms of England, Scotland, and Ireland, and popery, prelacy (expressly defined as 'church government by a variety of orders'), superstition, heresy, schism, &c., were to be extirpated, and the royal authority upheld 'in the preservation and defence of the true religion, and the liberties of the kingdom.' In the judgment of these Presbyterians the Covenant was a protest against absolutism, with this peculiarity that it was emitted in a form adapting it to ecclesiastical as well as civil purposes. As a measure of pacification Presbyterianism was established in Scotland by act of parliament (1690); but it was of a modified kind, the state reserving for itself a control over the church incompatible, in the opinion of the Cameronians, with its spiritual independence; while prelacy was confirmed in England and Ireland, and there was a general toleration of heresy. Therefore, in sentiment, if not in form, the extreme party repudiated the government of William III. and his successors, and maintained the perpetually binding obligation of the Covenants. Unquestionably these Cameronians acted under strong convictions, and only desired to carry out to a legitimate issue theoretical principles of the Church of Scotland which, for prudential considerations, have been practically in abeyance; and it is in the standards of this body that we find a true embodiment of the tenets held by the great body of English and Scottish Presbyterians of 1643.

Although thus an elder sister of the existing Church of Scotland and all its secessions, it was with some difficulty that, after the Revolution, it organised a communion with ordained ministers. The steadfastness of members was put to a severe trial by the defection of their ministers; but in 1706, after their faith and patience had been tried for sixteen years, they were joined by the Rev. John McMillan from the Established Church, and shortly afterwards by the Rev. John McNeil, a licentiate of the same church. To confirm the faith of members, and give a public testimony of their principles, the covenants were solemnly renewed on Auchensauch Hill, near Douglas, in Lanarkshire, in 1712. The subsequent accession of the Rev. Mr Nairn enabled the Cameronians to constitute a presbytery at Braehead, in the parish of Carnwath, on the 1st August 1743, under the appellation of the Reformed Presbytery. Other preachers afterwards attached themselves to the sect, which continued to flourish obscurely in the west of Scotland and north of Ireland, and in 1774 a presbytery was constituted in North America. The political position of the Cameronians was very peculiar, since, declining to recognise any laws or institutions which they conceived to be inimical to those of the kingdom of Christ, they refused to take the oath of allegiance. For this cause many of them formerly, though peaceable subjects otherwise and zealous for the interests of their native land, refused several of the responsibilities and privileges of citizens. In 1860 there was an attempt on the part of some of the kirk-sessions to prevent the members exercising the franchise, or becoming volunteers, on account of the oath of allegiance which required to be taken. On the question coming before the synod, inquiry was made as to

the meaning of the oath, and in the judgment of the majority it was ascertained that the oath was taken, and the franchise exercised, by Christian men of all other denominations in a sense which did not commit them to an approval of evils in the constitution to which they objected. It was decided accordingly, in 1863, to abstain from the exercise of discipline to the extent of suspension and expulsion on such questions. In consequence of this decision, to which forty-two congregations adhered, ten or twelve congregations seceded. In 1876 the larger body of the Reformed Presbyterians formally united with the Free Church, believing it to be in the full enjoyment of the spiritual independence which the Revolution settlement had failed to secure for the Church of Scotland, and recognising no difference between them in their civil relations. The principles of the Cameronians are now, therefore, distinctively represented by the few congregations which seceded in 1863. See the *Testimony of the Reformed Presbyterian Church* (1842).

Cameroon, or KAMERUN, till 1919 a German colony—conquered (1916) by French and British troops—on the west coast of Africa, extending from the Bight of Biafra to Lake Chad, and bounded by Nigeria, French Equatorial Africa, and the Spanish colony of Rio Muni, takes its name from the Cameroon River (Port. *camarão*, 'a shrimp'), whose estuary, opposite Fernando Po, is over 20 miles wide. The low mangrove swamps that clothe its banks render the climate very trying to Europeans. The comparatively civilised natives of the inland region are Sudanese; those of the coast belong to the Bantu (q.v.) group; their 'kings,' Bell and Akway, practically wholesale merchants, raised trouble by their refusal to permit natives of the interior to trade directly with Europeans. England declining to assume the protectorate, Germany was appealed to, and annexed Cameroon in 1884. The coast country is very fertile, ebony, red-wood, and palm-trees clothing the Cameroon, which has long been noted as an 'oil river,' and for its cotton and ivory; while many tropical fruits grow wild. North-west of the estuary lie the Cameroon Mountains, a volcanic group, which attain a height of 13,746 feet in the peak Mongo ma Loba ('mount of the gods'). The highest summit was first attained by Burton and Mann in 1862. Inland is a plateau, where cattle-rearing has become a flourishing industry. After the cessions by France in 1911 from French Congo, the territory touched the Congo at Bonga and the Ubangi at Mongumba. The ceded territory reverted to France (French Equatorial Africa) in 1919. Plantations of cocoa, rubber, kola, coffee, and tobacco have been (rubber and cocoa especially) very successful. Roads, railways, and telegraphs are rapidly being extended. The chief towns are Yaunde (the French capital, pop. 30,000) and Cameroon, or Duala (pop. 22,000); Buea (the German capital), Victoria, Kribi, Rio del Rey, and Campo are other important trading stations. As mandatories of the League of Nations in 1920 Britain took an interrupted strip (25,000 sq. m.) adjoining Nigeria (including Buea and the mountains), and France the rest (166,500 sq. m.).

Camillus, MARCUS FURIUS, a celebrated Roman patrician who first makes his appearance as censor (consular tribune, says Livy) in 403 B.C. He finished the war against Veii, taking the town in 396, after a siege of ten years; and in 394 he besieged the Falerii, who, after bravely defending themselves, were led by his magnanimous restoration of their children to yield unconditionally. Condemned nominally on a charge of misappropriating the booty, but really because of

his patrician haughtiness, he banished himself from Rome (391), and lived in retirement at Ardea, until Brennus (q.v.) had captured and destroyed the whole of Rome except the Capitol. Recalled and appointed dictator, he raised an army, and appearing, according to the legend, just at the moment when the garrison were about to purchase the departure of the Gauls, defeated and drove them from the town. It was due to his strenuous resistance that the proposal of the plebeians to remove to Veii was defeated, and the city rebuilt. He afterwards obtained new victories over the Æqui, the Volsci, and the Etrusci; and in 367 B.C., when war broke out with the Gauls, he, though eighty years old, accepted the dictatorship for the fifth time, defeated the barbarians near Alba, and made peace between patricians and plebeians. After all allowances for a considerable admixture of poetic fiction in the accounts that have come down to us, Camillus still stands out as one of the most prominent and worthy names in the history of Rome. He died of the plague, 365 B.C., lamented by the whole Roman people.

Camisards, the insurgent Huguenots of the Cevennes, so called from the *camise* or blouse worn by the peasants. The revocation of the Edict of Nantes by Louis XIV. in 1685 fired their zeal, which the employment of 'Dragonnades' (q.v.) to enforce the doctrines of the monks despatched as missionaries to the heretical district fanned to fanaticism; prophets and seers arose, who roused the people to a religious frenzy in which death was courted and torture was despised. At first their rage was directed against the tax-collectors, several of whom were murdered and their houses razed; but after an armed rising as early as 1689, a wider movement was brought on in 1702 by the cruelty of the Abbé du Chaila, who tracked out the retreats of the persecuted people, surprised them at worship, and hung some and imprisoned others. His murder gave the signal for a general insurrection; the Camisards' ranks swelled to thousands, and their mountain retreats enabled them to hold the royal forces at bay, while Louis' difficulties were increased by the commencement of the War of the Spanish Succession, and by the encouragement afforded to the insurgents by his enemies. Several detachments of soldiers had already been beaten back or cut off when in 1703 Marshal Montrevel was sent into the district at the head of 60,000 men. This man, once a Huguenot, now fiercely persecuted his former co-religionists; large numbers were shot down or executed, and 436 villages were destroyed. The Camisards retaliated with equal ferocity; in the diocese of Nîmes alone 84 priests were strangled, and some 200 churches burned down. The skill of their principal leader, Jean Cavalier (q.v.), his plan to pass into Dauphiné and unite with the Duke of Savoy, and the undoubted spread of the revolt, caused great anxiety; moreover, the burghers of Nîmes, Montpellier, Orange, &c., were in sympathy with the people and supplied them with all necessities, and even cast the bells of the burned churches into cannon for them. In April 1704 Montrevel was superseded by Marshal Villars, who followed a wiser course; he promised a free pardon to all who might surrender, and released all prisoners who were willing to swear allegiance, while he had every person taken in arms shot on the spot, and broke up his army into flying columns, which scoured the country on all sides. One band after another submitted; on the 10th May Cavalier accepted the amnesty; and by the end of 1704 the zealots who persevered in the war had all been taken and shot. The severity of the Duke of Berwick, Villars's successor (1705), occasioned a fresh outbreak; but this was put down in April with entire desolation of the province,

and the destruction or banishment of a great portion of the inhabitants. Many followed Cavalier into the service of the British in Spain, where most of them found a grave at Almansa in 1707.

Camlet, a fabric made from the hair of the Angora goat (q.v.), or even, in Britain, of wool, or of wool mixed with silk, cotton, or linen.

Cammaerts, ÉMILE, born at Brussels 16th March 1878, settled in England in 1908, and wrote, in French, patriotic Belgian poems, besides criticism, history and plays.

Camões (*Camões*), LUIS DE, the greatest poet of Portugal, was born at Lisbon in 1524. In 1537 Camões was entered at the lately-reformed university at Coimbra as one of the 'honourable poor students.' As by the reforms of John III. the new methods and studies of the revival of learning had been introduced into that university, Camões had here the opportunity, not only of studying Latin and Greek in the new spirit, but was brought into contact with the best thought of his time. A few years later this would have been impossible, as the university fell completely under the dominion of the Jesuits. It was the wish of his friends that Camões should enter the church, but this he resolutely declined to do. While he was still a student he wrote his *Amphitriões*, which was acted before the authorities of the university. He returned to Lisbon probably in 1542. He now fell in love with Donna Caterina Ataíde, who filled such a large place in his thoughts till her death, long afterwards, near the close of his stay in the East. The lady returned his affection, but her father prohibited their union; and the poet had to content himself with passionate protestations in his *Rimas*—short poems after the model of the Italians. For reasons not ascertained Camões was banished from Lisbon for a year, at the close of which he joined a Portuguese force at Ceuta, and served there for two years, losing his right eye by a chance splinter. In 1550 he again returned to Lisbon, where for the next three years he seems to have led a somewhat discreditable life. On the occasion of a procession on the festival of Corpus Christi, one of Camões' friends having become involved in a quarrel with one of the king's equerries, Camões interfered and wounded the equerry. Having been thrown into prison, he was released only on his volunteering to proceed to India. Accordingly, in 1553 Camões sailed for that country, and reached Goa that year. While here he engaged in two military expeditions, by way it would seem of escaping from Goa, whose society was but little to his mind. His bold denunciations of the Portuguese officials in that town at length led to his banishment to Macao in 1556. This exile was, however, an honourable one, as he held a lucrative post, from which, in two years, he realised a considerable fortune. During his stay in Macao he may have written the first six books of his chief poem, *The Lusíads*. Returning to Goa in 1558, Camões was shipwrecked and lost everything except his poem. Arrived at Goa, he was shortly afterwards thrown into prison through the machinations of his former enemies; but at length, after an exile of sixteen years, Camões returned to Portugal as poor as he had left it. The remainder of his life he spent at Lisbon in poverty and obscurity. In 1572 he published *The Lusíads*, with a dedication to King Sebastian. It had an immediate and brilliant success, but did little for the fortunes of its author, who died in a public hospital, 10th June 1580.

Few poets have had a career so chequered and full of adventure as Camões. From the very outset misfortune attended him, and though to a certain extent his misadventures were due to his

own indiscretions, these indiscretions were the faults of a bold, earnest, and upright nature. In India his ill-fortune was largely due to his outspoken scorn for the unscrupulous conduct of his countrymen. His contempt for the arts of the courtier accounts for his neglect at home. But if he was neglected in his lifetime, his countrymen have made him ample amends since his death. They have indeed insisted on assigning a rank to *The Lusíads* (*Os Lusíados*, 'the Lusitanians') which other nations have not recognised as its due. There is, however, good reason why the Portuguese should value it so highly. In this poem Camoens did for the Portuguese language what Chaucer did for English and Dante for Italian, and made himself, moreover, the interpreter of the deepest feelings and aspirations of the Portuguese nation. It has been called 'The Epos of Commerce,' and the Portuguese regard it as their national epic. The radical faults of the poem are its inartistic construction, and its puerile use of the classical mythology; and as in translation the felicity of the language and the smoothness of the rhythm by which the original is specially distinguished are in large measure lost, these faults have told greatly against its popularity with foreign readers.

Of Camoens' 352 sonnets, 70 have been well translated by Aubertin (1881); and there is a complete version by Sir R. Burton (2 vols. 1885). The following are the chief English renderings of *The Lusíads*—by Sir R. Fanshawe (1655), Mickle (1771-75; 6th ed. 1877), Musgrave (1826), Quillinan (books i-v. 1853), Sir L. Mitchell (1854), Aubertin (2 vols. 1878), and Sir R. Burton (2 vols. 1881). For the countless editions, see the *Bibliographia Camoëana* of Braga (Lisbon, 1880) and Vasconcellos (Oporto, 1880); also Sir R. Burton's *Camoens* (2 vols 1882), and Aubrey Bell's *Luis de Camões* (1923).

Camomile, or CHAMOMILE (*Anthemis*), a genus of Compositæ. The species are annual and

Camomile (*Anthemis nobilis*).

perennial herbs, all palæarctic. The most important species of the genus is *A. nobilis*, which has long been known for the medicinal virtues of an infusion of its flowers (*Flores Anthemidis*) as a bitter stomachic and tonic. These properties seem mainly due to an essential oil which is prepared by distillation; a bitter principle is also present, but no alkaloid. The plant is cultivated at Mitcham in Surrey, at Kieritzsch and elsewhere in Saxony, and in Belgium. Its flowers differ from the wild forms in being all more or less double, but those in which the conversion of tubular into ligulate florets has been less complete, leaving a somewhat yellow centre, are called by druggists *single camomiles*. The largest, whitest, and most completely double flowers are most esteemed. The other British species are mere weeds; one of them, called Stink-

ing Camomile (*A. Cotula*), is so acrid as to blister the fingers. But the flowers of the Dyer's Camomile (*A. tinctoria*), common on the Continent, yield a beautiful dye.

Wild Camomile (*Matricaria Chamomilla*) is the common camomile of German writers. It has long been employed as an adulterant or substitute for the other, and (illicitly) in brewing; its flower-heads are, however, easily distinguished, being quite single and not bitter; the receptacle is also hollow and devoid of the bracteoles which largely characterise the true camomile. A cultivated variety of *M. Parthenium* (*Feverfew*, q.v.) has also to be distinguished. The camomile of the Indian bazaars is another species of the same genus (*M. suaveolens*).

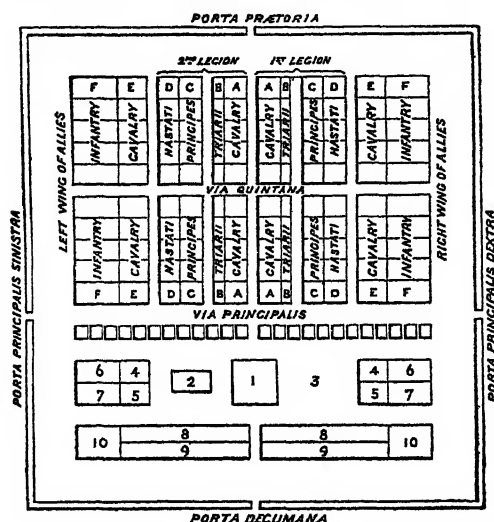

Camorra, the name of a secret society in the former kingdom of Naples, the members of which were called *Camorristæ*, and which for many years plundered and terrorised the country, undertaking also the transport of smuggled goods, and contracting for the commission of serious crimes. It had a central rendezvous in every large provincial town, and twelve such in the city of Naples; and for each of these sections there was a chief, with powers of absolute command, and a treasurer with charge of the common fund. Their wide and secret organisation enabled them to extend their system of extortion to all trades and classes; they even imposed a regular tax on all articles of food entering Naples. Candidates for membership swore upon an iron crucifix a fearful oath of fidelity and secrecy; and only after periods of pupillage and probation did they receive the two knives of peculiar form, by which the Camorristi recognised one another. Under King Ferdinand II. the Camorra was tolerated for political reasons. The government of Francis II. endeavoured to seize and transport all known members of it. Those who remained entered into alliance with the Garibaldian committee, and rendered essential service in the expulsion of the Bourbons. An attempt to employ them in the police service failed; and the society, by its promotion of brigandage, gave great trouble to the Italian government. At one time they became a political machine manipulated for plunder, and practically dominated the municipality of Naples, which had to be suspended for a time (1899). Investigations begun in 1907 led to a great trial of Camorristi, and in 1912 all but a few were convicted (some of murder), and sentences up to twenty or thirty years' penal servitude inflicted. See **Mafia**, **SECRET SOCIETIES**.

Camouflage (Fr. slang) applies the principles of protective coloration (see **PIGMENTS OF ANIMALS**) to the misleading of the enemy in warfare, by assimilating objects to the appearance of the background and breaking up their outlines; or (as in 'dazzle-painting') throws the observer out of his reckoning by fantastic patterns.

Camp, a collection of tents or huts for the shelter of troops. See also **HILL-FORTS**. A Roman army never halted for a single night without throwing up an entrenchment capable of containing the whole of the troops and their baggage. The Roman camp, as described by Polybius, was intended to accommodate an ordinary consular army, or two legions with *socii*, or allies—in all, 16,800 foot and 1800 horse. Its general form was square, each side 2017 Roman feet in length (the Roman foot being 11·65 English inches), the whole surrounded by a ditch (*fossa*), the earth dug out being thrown inwards, so as to form an embankment (*agger*), on the top of which was a palisade (*vallum*) of the wooden stakes (*valli*, *sudes*) which were carried by each soldier.

The whole camp was divided into two unequal

divisions by a straight road, the principal thoroughfare of the camp, called the *Via Principalis*, 100 feet in breadth, running parallel with the front and rear of the camp. At each extremity of this road was a gate; these were respectively the *Porta Principalis Dextra*, and the *Porta Principalis Sinistra*.

In front of the enemy was the *Porta Praetoria*, and opposite it the *Porta Decumana*. These were the four outlets of the camp.

The upper portion of the camp, separated from the lower by the *Via Principalis*, contained about one-third of the space occupied by the lower portion. In its centre stood the *Principia* (1), or general's tent, in the middle of an open square extending 100 feet on each side of it, its sides each 200 feet long, extending parallel with the sides of the camp. To the left of the *Principia* was the *Quæstorium* (2), the quarters of the quæstor; to the right, the *Forum* (3), the public market of the camp. Immediately before the *Principia* ranged the tents of the twelve *Tribuni* and the *Præfecti Sociorum*, or generals who commanded the allies. In the spaces marked 4, 5, 6, and 7 on either side of the *Prætorium*, were the general's staff, including probably the *Legati*, together with the *Prætoria Cohors*, consisting chiefly of picked men selected from the *Extraordinarii*; the former two being cavalry, the latter two infantry. In 8 were the remainder of the *Extraordinarii Equites*, facing towards the *Via Principalis*; in 9 the remainder of the *Extraordinarii Pedites*, facing towards the agger or rampart. The spaces marked 10 were reserved for occasional auxiliaries.

The centre of the lower portion of the camp was occupied by the two Roman legions which constituted an ordinary consular army, consisting of the infantry and cavalry of both legionaries and allies. It was divided into two equal parts by the *Via Quintana*, a road, 50 feet wide, which ran parallel to the *Via Principalis*, while the whole of the interior was surrounded by an open space, 200 feet wide, between the rampart and the tents, which allowed the troops ample freedom for movement. The tents were pitched in the twelve oblong compartments sketched in the plan, six above and six below the *Via Quintana*, and separated from each other by roads 50 feet wide. Each of these compartments was 500 feet long, and was divided into ten rectangular spaces, the proportional size of which is exactly represented in the plan. In the

spaces marked A, each containing 10,000 square feet, were the *Equites* of the Legion, each of the ten spaces being occupied by one *turma* of thirty men and horses. In B, each containing 5000 square feet, were the *Triarii* of the Legion, each of the ten spaces being occupied by a *manipulus* of sixty men. In C, each of 10,000 square feet, were the *Principes* of the Legion, each of the ten spaces being occupied by two *manipuli* of sixty men. The spaces marked D, each of 10,000 square feet, contained the *Hastati* of the Legion, each of the ten spaces occupied by two *manipuli* of sixty men. In E again, each containing 13,300 square feet, were the *Equites Sociorum*, each of the ten spaces occupied by forty men and horses; while in the spaces F, each 20,000 square feet in extent, were the *Pedites Sociorum*, each of the ten spaces accommodating 240 men.

The tents all faced the *Via* which formed their boundaries. Before each gate was posted a strong body of *velites*, called *custodes*, to prevent a surprise of the enemy, while pickets of cavalry and infantry, called *stationes*, were thrown forward in advance in each of the four directions to give timely warning of the approach of an enemy. Finally, sentinels (*excubite*) kept guard along the ramparts. The night, reckoned from sunset to sunrise, was divided into four equal spaces called *vigilæ*. The watchword (*signum*) for each night was inscribed on small tablets of wood (*tesserae*), which were passed along the whole lines, and returned to the tribunes again.

The different parts of the camp were so distinctly marked out and measured off beforehand, that the men on their arrival at once proceeded to their respective stations, as if they had entered a well-known city, and were marching to their accustomed quarters. After the Roman legions came to be divided into *cohorts* instead of *maniples*, the plan of the camp necessarily became somewhat altered, but its general plan and main features as to interior arrangement remained the same. In comparing the encampments of the Romans with those of his own countrymen, Polybius tells us that the Greeks trusted mainly to a judicious selection of their ground, and regarded the natural advantages which they thus secured as supplying in a great measure the place of artificial means of defence. The Greeks, consequently, had no regular form of camp, and no fixed places were assigned to the different divisions of the army. When the practice of drawing up the army according to cohorts, introduced by Marius and Cæsar, was adopted, the internal arrangements of the camp experienced a corresponding change. Later, even the square form was abandoned, and the camp was made to suit the nature of the ground. It was always held to be of importance, however, that the camp should occupy a defensible position, that it could not be overlooked, and that it had a command of water.

When stationary camps (*castra stativa*) came into more general use, we hear of several parts which are not mentioned by Polybius, for example, the infirmary (*valetudinarium*), the farriery (*veterinarium*), the forge (*fabrica*), &c.; and as a great variety of troops then came to be employed, they must, of course, have had new stations appointed to them in the camp. Standing camps were divided into *castra æstiva*, a permanent summer camp, and *castra hiberna*, a permanent winter camp. Many of the stationary camps ultimately grew into towns—an origin seen in the names of such English towns as Colchester, Winchester, Manchester, and Chester itself. Amongst the most perfect in Britain of those which retained the form of the simple encampment, is that at Ardoch (q.v.) in Perthshire, in the grass-covered mounds and ridges of which

most of the divisions of the camp have been distinctly traced by antiquaries.

MODERN CAMPS.—The principles of castrametation, or camp-formation, underwent much change after the invention of gunpowder. Camps are now collections of tents or huts in which soldiers are lodged during a campaign or field manoeuvres. The immense size of European armies makes it impossible to carry tents for the troops, and they are almost always accommodated in Cantonments (q.v.) or Bivouacs (q.v.). The Italians alone retain the 'tente d'abri,' which, weighing only 11 lb., can be carried in portions by the three men who sleep in it. But in hot climates, and when, as in most British expeditions, the force engaged is comparatively small, they are placed 'under canvas,' forming what are called *flying camps* if occupied for one or two nights only, and *standing camps* if stationary for a longer period. At Aldershot (q.v.), Shorncliffe, Colchester, and the Curragh of Kildare, large camps of exercise have been established; and small instructional camps are formed for a few weeks every summer in the various military districts, to train the regulars, special reserves, and territorials in the duties of camp life and field operations.

British regulations lay down rules for 'minimum camping space in yards,' from which the following figures are taken, the first number being the frontage—cavalry regiment, 160 by 150; horse or field battery, 75 by 150; brigade ammunition column, 100 by 150; infantry battalion, 75 by 150; field ambulance, 120 by 200; divisional supply column, 150 by 200.

Certain typical arrangements of these unit camps are also laid down, but the ground available will often necessitate modifications. Each bell-tent takes 12 to 15 men. In a battalion camp each row of tents contains the men of a half-company, making eight rows for rank and file. If numerous units are camped together, each is to have a parade ground of at least 60 yards in depth in front of its camp, 25 yards is left clear at the sides, and to each unit is allotted a route for marching into the open. Ground with steep slopes is avoided, as also woods with undergrowth, low meadows, newly turned soil, sites of old camps. Sanitary squads, superintended by an officer, are constantly at work. Dismounted units are placed nearest to the water-supply.

All units have, to mark their locations, distinguishing flags by day and lamps by night, and finger-posts are erected for all important directions. The commander-in-chief has a Union Jack by day and two red lamps vertically; a division has a red flag, and a red and a green lamp vertically; ammunition column, square blue flag, and red and green lamp horizontally; supply column, triangular blue flag, and green lamp; hospital or field ambulance, jack and Geneva flag side by side, and two white lamps horizontally; latrine, yellow flag; &c.

The site of a camp should have a plentiful supply of good water and wood for fuel, the ground firm turf, with sand or gravel subsoil, good natural drainage, easy communications throughout, and access to good roads in front and rear. Tactical considerations, if within two days' march of the enemy, are paramount, and must decide the position of the camp. Thus, a large force intending to fight a battle, in a chosen position, would be encamped or bivouacked in rear, but near enough to occupy it before the enemy's advanced artillery could come within range, the camp being, if possible, invisible to the enemy. Infantry would be encamped in front and on the flanks of cavalry and artillery, which take longer to turn out, and should therefore have this protection. The safety of such a camp would be ensured by a strong line of outposts some three miles in front of the fighting

position, and probably by an advanced cavalry screen 10 or 20 miles farther towards the enemy. It follows that the system of surrounding camps or bivouacs by defensive works is no longer necessary nor possible when armies of perhaps 250,000 men are in question. But if a small force is holding a point on the lines of communication or operating against savages, some obstacle is essential to check a sudden onslaught of overpowering numbers upon front, flank, and rear.

When, as on the march, time does not admit of regular fortification, some sort of protection must be improvised. This was done in the Sudan campaigns by utilising the baggage and by surrounding the camp with a 'zareba,' or impenetrable inclosure of thorn bushes cut down for that purpose. In Zululand also, the Boer method of forming a 'laager' round the camp by interlocking the baggage-wagons was adopted, after the disaster of Isandhlwana had demonstrated the necessity of some protection against the enveloping attack of the Zulu army.

The cantonments of a besieging army are strengthened against sorties by entrenchments, and *entrenched camps* have now superseded other forms of permanent Fortification (q.v.). Such a camp consists of a girdle of detached forts surrounding the *enceinte* at a distance of several miles, so that the area thus inclosed is a protected position from which a field army can operate.

Campagna, a town of Italy, 13 miles E. of Salerno, with a cathedral, and some trade in wine, oil, fruit, and wood; pop. 10,000.

Campagna di Roma, an undulating plain of Italy surrounding Rome, including the greater part of ancient Latium, with a length of about 90 miles, and an extreme breadth inland, to the Alban and Sabine hills, of 40 miles. A broad strip of sandy plain skirts the Mediterranean, with a thick fringe of pines. The ground is almost entirely volcanic, the lakes being crater-lakes, and the Tiber winds across the plain between banks of tufa, of which the Seven Hills of Rome are composed. For many centuries malaria has been endemic, and the inhabitants very few in number, being driven away in summer by fear of the *aria cattiva* or pestilential vapour to which Malaria (q.v.) was believed to be due. In autumn herdsmen descend from the Apennines with their herds, the pasturage in some parts of the plain being rich and abundant; and skins, wool, and cheese, together with wine, are exported in some quantity. This district was not always desolate. Of late it has been maintained that the seeds of malaria were introduced from Africa in Hannibal's wars. Certainly fever was not endemic till long after that. Domitian and Hadrian built here their splendid villas; and in the early years of the Republic such towns as Veii and Fidene stood here, as well as a number of small places that survived till medieval times. It was swept by Goths, Vandals, and Langobards from the 5th to the 8th century, afterwards by Normans and Saracens, and shipped of its remaining wealth by rival barons; the removal of the pope to Avignon completed its desolation, which neglect, the cessation of tillage, and successive inundations of the Tiber, always more frequent as the inland forests were destroyed, only intensified, and which later efforts in the way of drainage, canalisation, and timber-planting did little to remove. Pius VI. especially endeavoured to drain the Pontine Marshes, and, during their dominion in Italy, the French effected some improvements. Garibaldi also during his later years interested himself greatly in the matter, and since the discovery of the real cause of malaria a good deal has been done to render part of the Campagna habit-

able, especially the real Roman Campagna for a radius of 25 miles round Rome, and a few desert areas have been occupied. But still only a very small part of the larger area is under cultivation. Elsewhere only mean taverns and the huts of shepherds and vine-dressers break the solitudes that stretch for miles round Rome. See Lanciani's *Wanderings in the Roman Campagna* (1909).

Campan, JEANNE LOUISE HENRIETTE, born in Paris, October 6, 1752, from 1770 till 1792 was Marie Antoinette's confidant, and during the Reign of Terror withdrew to the valley of Chevreuse, beyond Versailles. After the fall of Robespierre she opened a boarding-school at St Germain-en-Laye; and in 1806 she was appointed by Napoleon head of the Institution at Ecouen for the education of the daughters of the officers of the Legion of Honour. At the Restoration this institution was suppressed, and Madame Campan retired to Mantes, where she died, May 16, 1822. She is remembered on account of her *Mémoires sur la Vie Privée de la Reine Marie Antoinette* (1823), *Journal Anecdotique* (1824), and *Correspondance Inédite avec la Reine Hortense* (1835). See works by Flammeimont (1886), Calette (1891), and Montague (1914).

Campanella, TOMMA'SO (properly *Giovanni Domenico*), was born 5th September 1568, at Stilo in Calabria, and studied at Naples and Cosenza. He entered the Dominican order in his fifteenth year. The writings of Telesius first awakened his doubts respecting the 'scholastic philosophy.' The results of his first studies were given in his *Philosophia Sensibus Demonstrata*, &c. (Naples, 1591), which contained a defence of Telesius. His superiority in disputations exposed him to the hatred and false accusations of the orthodox monks and schoolmen. He was in consequence compelled to flee from Naples to Rome, and thence to Florence, Venice, Padua, and Bologna. He returned to Calabria in 1599, but being suspected of having involved himself in a political conspiracy, he was seized and confined in a Neapolitan dungeon for twenty-seven years; tried five times, and tortured seven; accused of heresy; and declared the author of a book which had been published thirty years before he was born. In 1626 Pope Urban VIII. had him brought to the prison of the Inquisition at Rome, and three years afterwards gave him his liberty and a yearly pension. After being again persecuted by the Spanish government, Campanella went to Paris, where he was graciously received by Louis XIII. and Richelieu. He died in the Dominican monastery of St Honoré, near Paris, 21st May 1639. More than 40 works on various subjects (several of which are lost) were written by Campanella during his imprisonment. His philosophical views were characteristic of the transition from the 16th to the 17th century. In his theory of perception, which starts from the external sense ('sensum solum sapere'), he is a forerunner of the empiric and sensualist school; in his doctrine of the inner sense (which is the condition of the outer) he finds his refuge from scepticism; and his conviction that we possess in our consciousness of self an impregnable certainty of our own existence points forward to Descartes and Leibnitz. His aim was to reconcile the theology of Aquinas with the natural philosophy of Telesius by means of his metaphysics; and to prove that all worldly powers should serve the Church, and all secular science be the handmaid of religion. His *De Monarchia Hispanica Discursus* is a work of great power and value, comprising a sketch of the political world of Campanella's time, with special reference to Spain. It was translated into English during Cromwell's Protectorate. Of his other works the most noteworthy are *Astrologiæ æternæ, Libri VII.* (1617); *De Sensu Rerum et Magna*

(1620); *Philosophia Epilogistica Realis* (1623); *Universalis Philosophiæ, Partes III.* (1638); *Philosophiæ Rationalis et Realis, Partes V.* (1638); and *Civitas Solis* (1623), an imitation of Plato's *Republic*. His Life has been written by Baldacchini (1847), Berti (1878), and Amabile (3 vols. 1882). His poems and sonnets, first published by his German disciple, Tobias Adami, in 1622, had been lost sight of, until, after a long search, they were rediscovered by J. G. Orelli. They were republished by him in 1834, and by Gentile in 1915. The *Sonnets* were translated into English verse by J. Addington Symonds in 1878.

Campanero. See BELL-BIRD.

Campanha, a town in the Brazilian state of Minas Geraes, 150 miles NW. of Rio de Janeiro, surrounded by bare hills, much cut up by gold-mines, but with large herds of cattle on the lowlands; pop. 8000.

Campania, anciently a province on the west coast of Italy, having Capua as its capital (now subdivided into the provinces of Benevento, Naples, Salerno, Avellino, and Caserta), lying between Latium, Samnium, and Lucania. It was one of the most productive plains in the world, yielding in extraordinary abundance corn, wine, and oil; and by both Greek and Roman writers is celebrated for its soft and genial climate, its landscapes, and its harbours. It was the *regio felix* of the Romans, who built here many of their most splendid villas, and made Baiae, with its hot springs, the centre of their fashionable world. The promontory Misenum, Mount Vesuvius, the river Volturnus, the towns Baiae, Cumæ, Liternum, Puteoli, Naples, Herculaneum, Pompeii, Nola, Salernum, Capua, &c., belonged to Campania. In very early times the Greeks founded Cumæ, from which Puteoli, Naples, and other places were colonised. The district was next conquered by the Etruscans, by whom Capua, Nola, and other towns, were founded, but who succumbed to the more warlike and hardy Samnites, who, in their turn, yielded to the irresistible valour of Rome. Through all these vicissitudes of conquest the substratum of the people remained as at the beginning. The mass of the Campanians were essentially of Oscan (q.v.) race, and Oscan they remained. Indeed it is mainly from them that our knowledge of the Oscan language is derived, and one of their towns, Atella, introduced to the early Roman stage a species of popular drama or comedy. See ATELLANÆ.

Campanile (Ital. from low. Lat. *campana*, 'a bell'), a name adopted from the Italian to signify a bell-tower of the larger kind, and usually applied only to such as are detached from the church. Scarcely any of the existing bell-towers of England answer to the Italian conception of the campanile; and the beautiful 'campanile' at Salisbury, demolished by Wyatt in 1790, was really a multangular Belfry (q.v.) surmounted by a leaden spire. In Italy campaniles are found everywhere—at Rome, Bologna, Padua, Ravenna, Cremona, Venice. Perhaps the most remarkable are the so-called 'leaning tower' of Pisa and the campanile of Florence. The former, which is circular in form, is decorated with columns and arcades to the summit of its eight stories (see ROMANESQUE ARCHITECTURE). But though less curious, the famous campanile of Giotto at Florence is perhaps even more worthy of the traveller's attention. It was erected in 1334-37, with the express object of surpassing, both in height and in richness of workmanship, any of the remains of antiquity. In form it is a parallelepiped, and is of the same dimensions from bottom to top. Though it is very lofty—275 feet—it consists of only four stories, of which the

tallest are the uppermost and undermost. The style is Italian Gothic, and the walls are entirely veneered with marble. The original design of Giotto was that a spire of 90 feet in height should have surmounted the present structure, and on the summit may be seen the four great piers from which it was intended that it should have risen. The splendid campanile of Florence, in its present condition, must thus be regarded only as a fragment. There is a fine campanile at Seville, 275 feet in height, the lower part of which (185 feet) was built as a minaret by Abu Yusuf Yakub in 1196, whilst the upper was added in 1568. It is called La Giralda ('the weather-cock'), from a bronze figure of Faith, which, though it weighs a ton and a quarter, turns with the wind. The campanile attached to the palace of the Scaligeri at Verona is very graceful, and characteristic of the Italian principles of

Campanile, Palace of the Scaligeri, Verona.

tower-building. The origin of the campanile as an adjunct to Christian structures is unknown. It cannot originally have been used for bells, as in early times only hand-bells of very small size were in use. Most probably, like the round towers of Ireland, the campaniles were constructed as places of security and observation. The earliest examples, such as those at Ravenna, are lofty and round. In later times the campanile was found useful for the great bells of the churches and cities, when they became objects of importance, and received elaborate decoration. They continued to be erected in all the styles of architecture practised in Italy up to recent times. Numerous Renaissance examples are thus found in Venice and elsewhere, that of St Mark's (rebuilt 1303-11) being a conspicuous feature of the city.

Campanology. See BELL.

Campanula (Lat., 'a little bell'), a genus of Campanulaceæ (q.v.), commonly known as Bell-flowers or Bells. The species number about 200, chiefly palæarctic, but found as alpine plants in warmer and southern regions. The flowers are generally beautiful, and many are cultivated. The common wild *C. rotundifolia* is, however, more familiar than any other species, both on account of its commonness and simple beauty, and as the

Harebell (q.v.) of English poetry and Bluebell of Scottish song. *C. Trachelium*, the nettle-leaved campanula, and *C. glomerata* are not uncommon, both wild and in cultivation; but the biennial species, so familiar in gardens as Canterbury Bells, is *C. medium*, a native of Mediterranean countries, which has yielded many florists' varieties, presenting great diversity of colour, size, and doubleness. As annuals and perennials for the herbaceous border and rock-garden many other species and varieties are esteemed; while *C. rapunculus* (Rampion or Ramps) was formerly more cultivated than at present on account of its esculent root, the leaves being also used in salads.

Canterbury Bell.

Campanulaceæ, an order related to Compositæ; herbs, rarely shrubs or trees, with bitter milky juice; acid and often poisonous; diuetic. The young shoots and roots of some species are, however, occasionally eaten, as is also the half-fleshy fruit of *Camarina campanula*, in the Canaries. While the Campanuloideæ, with regular bell-like corolla and free anthers, are chiefly palæarctic, the Lobelioideæ, with irregular corolla and coherent anthers, are chiefly tropical or subtropical. *Phyteuma* and *Jasione* have heads like the Compositæ. See CAMPANULA, LOBELIA.

Campanularia, a common genus of Hydrozoa (q.v.), and type of a family, Campanulariæ. The delicate stem bearing the colony of polyps may be simple or branched; the nutritive individuals are surrounded by transparent bell-shaped sheaths, within which they may be retracted. The mouthless, tentacle less, reproductive individuals bud off sexual ones, which do not, however, go free as they so often do in allied genera. The group of generative buds produced by the reproductive person is inclosed within a special sac-shaped sheath, and the whole thing is called a sporosac. In allied genera, though not in Campanularia, the sexual buds go off as swimming-bells, and from their generative products and embryos the fixed asexual plant-like 'zoophyte' is again formed. The genus is common in north European seas and in the Mediterranean. Allied genera are Clytia, Hincksia, Laomedæa (with sporosacs), Eucopa, and Obelia (with free swimming-bells). See HYDROZOA and books there named;

Campanularia:

a, nutritive individuals; b, reproductive individuals or sporosacs.

Johnston's *British Zoophytes*; Allman's Ray Society Monograph on Hydromedusa.

Campbell, an ancient and illustrious Scottish family, to which genealogists have chosen to assign an Anglo-Norman origin, deriving its surname from the Latin *De Campo Bello*. According, however, to the 8th Duke of Argyll, it is purely Celtic, of Scoto-Irish origin; and *Cambel*, as the name was always formerly written, is just the Celtic *cam beul*, 'curved mouth.' Sir Duncan Campbell of Lochow, created Lord Campbell in 1445, and his descendants, the ducal house of Argyll (q.v.), have been noticed already. From his younger son, Sir Colin Campbell of Glenorchy (circa 1400-78), are descended the earls and marquises of Breadalbane (creations 1681 and 1831-85); and from the younger son of the second Earl of Argyll, who fell at Flodden in 1513, the earls of Cawdor (created 1827).

Campbell, ALEXANDER, founder of the sect known as the 'Disciples of Christ,' or more commonly the 'Campbellites,' was born near Ballymena, in County Antrim, in 1788, but emigrated to the United States in 1807. He early adopted the opinions of his father in protesting against all human creeds, and asserting that the sole authority in religious things was the Bible alone. Though at first a Presbyterian, in 1812 he formed a connection with the Baptists, and for some time he laboured as an itinerant preacher principally in Western Pennsylvania, Virginia, and Ohio. In 1826 he published a translation of the New Testament, in which the words 'baptism' and 'baptist' gave place to *immersion* and *immerser*. Some loosely defined expressions in his writings have been interpreted as implying a belief in baptismal regeneration, a doctrine which the Disciples repudiate. By his discussions on public platforms, and his serial publications, the *Christian and Baptist* and the *Millennial Harbinger*, as well as by his assiduity in preaching tours and in training young men for the ministry, Campbell gradually formed a large party of followers, who began about 1827 to form themselves into a sect under the designation of 'The Disciples of Christ,' which has now, in the United States, about 7000 churches and a million and a quarter members. In 1841 Campbell founded Bethany College in West Virginia, and there he died, 4th March 1866. His writings were numerous. See his *Life* by Richardson (1868).

Campbell, SIR COLIN, LORD CLYDE, one of the bravest soldiers and most distinguished generals of modern times, was born in Glasgow, 20th October 1792. His father was a carpenter, named MacIver, but Colin assumed the name of Campbell from his mother's brother, Colonel John Campbell, who in 1802 put him to school at Gosport. He was gazetted an ensign in 1808, and by 1813 had fought his way up to a captaincy, serving on the Walcheren expedition (1809), when he contracted a life-long ague, and through all the Peninsular war, where he was severely wounded at the siege of San Sebastian and the passage of the Bidassoa. He took part in the expedition to the United States (1814), and then passed nearly thirty years in garrison duty at Gibraltar, Barbadoes, Demerara, and various places in England, in 1837 becoming lieutenant-colonel of the 98th foot. For the brief Chinese campaign of 1842 he was made a C.B., and for his brilliant services in the second Sikh war (1848-49) a K.C.B., thereafter commanding for three years at Peshawar against the frontier tribes. On the outbreak of the Crimean war in 1854 he was appointed to the command of the Highland Brigade; the victory of the Alma was mainly his; and his, too, the splendid repulse of the Russians by the 'thin red line' in the battle of Balaklava. He was rewarded with a G.C.B.,

with a sword of honour from his native city, and with several foreign orders, and in 1856 was appointed Inspector-general of Infantry. When on 11th July 1857 the news reached England of the sepoy Mutiny, Lord Palmerston offered him the command of the forces in India, he started next day for Calcutta. He reached it in August; on 17th November, with 4700 men, effected the final relief of Lucknow; and on 20th December 1858, having five months earlier been created Lord Clyde, announced to the viceroy that the rebellion was ended. Returning next year to England, he was made a field-marshal, and received a pension of £2000. He died 14th August 1863, and was buried in Westminster Abbey. See his *Life* by Lieutenant-general Shadwell (2 vols. 1881).

Campbell, GEORGE, divine, was born in 1719 at Aberdeen, and educated there at the grammar-school and Marischal College. Abandoning law for divinity, he was in 1748 ordained minister of Banchory Ternan, a parish 17 miles SW. of Aberdeen; in 1757 was called to that city, and in 1759 was appointed Principal of Marischal College. His first book was his famous *Dissertation on Miracles* (1762), in answer to Hume, a work which in its own day was greatly admired, and characterised as 'one of the most acute and convincing treatises that has ever appeared on the subject.' It was speedily translated into French, Dutch, and German. In 1771 Campbell was elected professor of Divinity in Marischal College. In 1776 he published his *Philosophy of Rhetoric*, in 1789 a *Translation of the Gospels*. He died 6th April 1796; and in 1800 appeared his *Lectures on Ecclesiastical History*, with a memoir by G. S. Keith prefixed.

Campbell, JOHN, BARON, Lord Chancellor of England, biographer of the chancellors, was born 15th September 1779 at Cupar-Fife, the third child of the parish minister. He was destined for the ministry, and passed in 1790 from Cupar grammar-school to St Andrews University, which he left in the spring of 1798 to become tutor to the son of a West India merchant in London. Having determined to follow the legal profession, Campbell joined Lincoln's Inn (1800), read for several years in the chambers of the famous Mr Tidd, during which period he also acted as reporter and dramatic critic to the *Morning Chronicle*, and was called to the bar in 1806. His abilities and perseverance, his readiness to assist professional brethren, and the publication of the first volume of his elaborate *visi prius* 'Reports' (1808), brought him into favourable notice even on the home circuit; and by the end of 1824 he became leader of the Oxford circuit, which he had joined in 1810. In 1821 he married the eldest daughter of Mr Scarlett, afterwards Lord Abinger, who was made Baroness Stratheden in her own right in 1836, and by whom he had three sons and four daughters. He became king's counsel in 1827, and chairman of the Real Property Commission in 1828. He entered parliament in 1830 as member for Stafford, and after some hesitation accepted the Reform Bill of 1831. His real interest lay in law reform. In 1832 he was made Solicitor-general, knighted, and returned to parliament for Dudley. Upon his promotion to the Attorney-generalship in 1834, Campbell, defeated at Dudley, was returned for Edinburgh. In 1841 he became Lord Campbell, and was raised to the Lord-chancellorship of Ireland, an office which he soon resigned, on the defeat of the Melbourne ministry, honourably declining the pension to which he was legally entitled. Lord Campbell was made Chancellor of the Duchy of Lancaster in 1846, Chief-justice of the Queen's Bench in 1850, and Lord Chancellor of England in 1859. He died on the night of 22d June 1861.

In politics Campbell was a consistent Whig. He boasted that the vote, which at some personal inconvenience he had returned from circuit to the House of Commons to give, had carried the second reading of the Reform Bill in 1831. As an advocate, Campbell was sound and industrious rather than brilliant; he was a courteous and eminently painstaking judge. As Chief-justice of the Queen's Bench he presided over the trial of Dr Newman for libel (1855), and the prosecution of William Palmer for poisoning (1856). As Lord Chancellor he delivered judgment in the *cause célèbre* of the Emperor of Austria v. Kossuth. Among the statutes introduced by Campbell's influence may be mentioned one limiting liability in actions of defamation (6 and 7 Vict. chap. 96); a second, which he borrowed *without acknowledgment* from Lord Lyttelton, enabling the representatives of persons killed by accident to recover compensation in certain cases (9 and 10 Vict. chap. 93); and a third, against obscene publications (20 and 21 Vict. chap. 87).

It is in his capacity of legal biographer that Campbell's reputation has suffered most severely. His *Lives of the Chief-Justices* (1849-57) and of the Lord Chancellors (1845-47), though readable and amusing, are disfigured by childish vanity, by the constant obtrusion of himself and his own achievements, and—at least in the later volumes—by wanton misrepresentation and inaccuracy. Repeating Arbuthnot's witty saying on Curll's biographies, Sir Charles Wetherell declared that 'his noble and biographical friend had added a new terror to death.' See the *Life* by his daughter, the Hon. Mrs Harcastle (1881); Foss's *Judges*, ix. 155-167; Sugden's *Misrepresentations in Campbell's Lives*; Atlay's *Victorian Chancellors* (1907-8).

Campbell, JOHN FRANCIS, of Islay, a great folklorist, was born December 29, 1822. Educated at Eton and the university of Edinburgh, he held offices at court, and was afterwards secretary to the lighthouse and coal commissions. He travelled much, and died at Cannes, 17th February 1885. An enthusiastic Highlander and profound Gaelic scholar, as well as a man of singularly lovable nature, Iain Og Ile ('Young John of Islay') preserved all the affectionate loyalty of the islanders of Islay, although he had lost the estates of his fathers. An obelisk was raised to his memory in the June of 1887 on the summit of Cnoc-na-Dàb, a hill in Islay, near his birthplace. Campbell's great work is his *Popular Tales of the West Highlands* (4 vols. Edin. 1860-62), one of the most important contributions ever made by any scholar to the scientific study of folk-tales, or *storiology*, to use his own word. Only those who have themselves made experiment in collecting folk-tales can appreciate the marvellous combination of devoted patience and quick intelligence, with profound sympathy and insight into primitive habits of thought, that went to the making of such a book. Had he lived longer he might have given folklorists further volumes out of the ample store of materials he left behind him. His *Leabhair na Feinne*, a series of Gaelic texts, he began to issue in 1872. Campbell gave much attention also to scientific studies, fruits of which were his *Frost and Fire*, *Natural Engines*, *Toolmarks and Chips* (1865), *Thermography* (1883), and the invention of the sunshine-recorder for indicating the varying intensity of the sun's rays. His *Circular Notes* (1876) consisted of letters written home during a tour round the world.

Campbell, JOHN M'LEOD (1800-72), a Scottish theologian, born at Kilninver in Argyllshire, went to Glasgow University at eleven, was ordained minister of Row in 1825. His views on the per-

sonal assurance of salvation and the universality of the atonement led to his deposition for heresy by the General Assembly in 1831. Campbell refused to form a new sect or to attach himself to that of his devoted friend Edward Irving. For two years he laboured in the Highlands as an evangelist, and for six-and-twenty years, from 1833, preached quietly without remuneration in Glasgow. His principal works were *Christ the Bread of Life* (1851), *The Nature of the Atonement* (1856), and *Thoughts on Revelation* (1862).

See ATONEMENT; the *Memorials* by his son (2 vols. 1877), and Maughan's *Annals of Garelochside* (1896).

Campbell, LEWIS, Greek scholar, born in Edinburgh in 1830, was educated at Edinburgh Academy and the universities of Glasgow and Oxford (Trinity and Balliol), and became a Fellow of Queen's College. He took orders in the Church of England, and was a parish clergyman in Hampshire until 1863. In that year he was appointed to the professorship of Greek in the university of St Andrews. Twenty-nine years later he resigned his chair, and on the 25th October 1908 he died at Brissago, Lago Maggiore. He did much to further the study of Greek, giving special attention to Sophocles and Plato. Besides his great work, the edition of *Sophocles: The Plays and Fragments* (2 vols. 1871-81), he published editions of Plato's *Theætetetus* (1861), *Sophistes and Politicus* (1867), and, with Jowett, *The Republic*. He translated Sophocles and Æschylus into English verse, and discussed *The Tragic Drama in Æschylus, Sophocles, and Shakespeare*. He was also the author of a book on *Religion in Greek Literature*. Apart from his Greek studies, he prepared with Mr William Garnett *The Life of James Clerk Maxwell* (1882), and with Mr Evelyn Abbott *The Life and Letters of Benjamin Jowett* (1887); and he edited Jowett's essays and theological writings.

Campbell, MRS PATRICK (Beatrice Stella Tanner), actress, born in 1865 at Kensington of mixed English and Italian parentage, married in 1884, went on the stage in 1891, and gained fame in the *Second Mrs Tanqueray* (1893). Her first husband died in South Africa in 1900; in 1914 she married George Cornwallis-West. See *My Own Life* (1922).

Campbell, THOMAS, poet, was born in Glasgow, 27th July 1777, the youngest of the eleven children of an unfortunate merchant. From the grammar-school of his native city he passed in 1791 to the university, where he remained off and on till 1796, winning several prizes, and being specially distinguished for his knowledge of Greek literature. In 1795 he went as a tutor to the island of Mull. The scenery of the West Highlands made a deep impression on his mind, and to his abode in those grand and desolate regions his verses owed much of their finest touches of sublimity. In 1797 he repaired to Edinburgh, intending to study law; but he could not shake off his recollections. In his eyes the mists were folded on the hills of Morven, the roar of Corrievekin was in his ears, and instead of poring over musty law-books, he wrote *The Pleasures of Hope*. It was published in 1799, and ran through four editions in a twelvemonth. During a ten-months' tour on the Continent (1800-1) Campbell visited the battlefield of Hohenlinden, at Hamburg fell in with the prototype of his *Ecile of Erin*, and sailed past the batteries of Copenhagen. In 1803 he married and settled in London, having refused the offer of a chair at Wilna, and resolved to adopt a literary career. He contributed articles to *The Edinburgh Encyclopædia*, and compiled *The Annals of Great Britain from George II. to the Peace of Amiens*. In 1806, through Fox's influence, he received a pension of £200 per annum from government. In

1809 appeared *Gertrude of Wyoming*, which bears the same relation to *The Pleasures of Hope* that *The Castle of Indolence* bears to *The Seasons*—a less brilliant and striking, but more mature and finished performance. In 1818 Campbell was again in Germany, and on his return he published his *Specimens of the British Poets*. In 1820 he delivered a course of lectures on poetry at the Surrey Institution; and from this date to 1830 he edited *The New Monthly Magazine*, contributing thereto several poems, one of which, *The Last Man*, is in some respects the loftiest of all his performances. In 1827-29 he was elected and re-elected Lord Rector of the university of Glasgow. He died at Boulogne, 15th June 1844, and was buried in Westminster Abbey, a Polish noble sprinkling his coffin with dust from Kosciuszko's grave. Campbell is an English classic, though his fame has somewhat declined. His larger poems are now little read, and command but a qualified admiration. His fame must rest, not on their conventional merits, but on the fire of his war songs; *Hohenlinden*, *Ye Mariners of England*, and *The Battle of the Baltic* can hardly be matched in the language.

See the *Life and Letters*, edited by Beattie (1859); the short *Life* by Cuthbert Hadden (1900); and the *Poems* as edited by Prof. Lewis Campbell (a descendant, 1904) and Logie Robertson (1908).

Campbell-Bannerman, SIR HENRY (1836-1908), who as premier secured the restoration of self-government to the Transvaal and the Orange Free State, was second son of Sir James Campbell of Stracathro, the head of a business house, who was Lord Provost of Glasgow in 1840-43. He assumed the name Bannerman in 1872. Educated at Glasgow and Trinity College, Cambridge, he became Liberal M.P. for the Stirling burghs in 1868, and was Chief Secretary for Ireland (1884-85) and War Secretary (1886 and 1892-93). In 1895 he was created a G.C.B., in 1899 became Liberal leader in the House of Commons, and in December 1905 prime-minister. See *Life* by J. A. Spender (1923).

Campbell Island, a lonely volcanic islet, far to the south of New Zealand, in 52° S. lat., 167° E. long., is included in the Dominion.

Campbeltown, a royal burgh and seaport of Argyllshire, on the E. coast of Kintyre, 83 miles SW. of Glasgow. It curves round the head of a small sea-loch sheltered by Davaar Island (300 feet high), which forms a magnificent harbour. A sculptured granite cross (12th c.) stands in the main street. The place, which is a fishing centre, and has over twenty whisky distilleries, till 1918 united with the Ayr burghs to return one member to parliament. Pop. 7000.

Campe, JOACHIM HEINRICH, a German educationist, born near Holzminden in 1746, was tutor for a time to the brothers Humboldt, and minister in Potsdam. After serving with Basedow (q.v.) at the *Philanthropin* in Dessau, he founded an institution of his own, and in 1787 undertook the reorganisation of the school-system in Brunswick, where he also established a large publishing house. He died 22d October 1818. His theoretical works on education were of importance in their time, and his *German Dictionary* (5 vols. 1807-11), though weak in its historical department, is still of value. His books for the young (37 vols. 4th ed. 1832) have been remarkably popular, especially *Robinson der Jüngere* (Eng. trans. 1855). See his *Life* by Leyser (2 vols. Bruns. 1877).

Campeachy (*San Francisco de Campeche*), a seaport on the west side of the peninsula of Yucatan, on a bay of the same name. It has a citadel, colleges, and other fine buildings, and shipbuilding docks. The haven is safe, but very shallow, and the trade, principally in logwood and

wax, has greatly fallen off; while cigars and palm-leaf hats are almost the only manufactures. Founded in the middle of the 16th century, it was taken, occupied, and burned by buccaneers in 1685. Pop. 20,000. Campeachy gives name to a state of Mexico, having an area of 13,000 sq. m. Pop. 100,000.

Campeachy Wood. See LOGWOOD.

Campeggio, LORENZO, CARDINAL, was born in 1472, of a noble Bolognese family. He studied law, and married early, taking holy orders after his wife's death. He was made Bishop of Feltri, and sent by Leo X. on a mission to the Emperor Maximilian, being created a cardinal in his absence (1517). Next year he visited England as papal legate to incite Henry VIII. against the Turks, and was well received. In 1524 he obtained the bishopric of Salisbury and the archbishopric of Bologna, and he presided the same year at the Ratisbon diet; in 1528 he was despatched to England to hear the famous divorce suit of Henry VIII. against Catharine of Aragon. Perplexed betwixt his own private instructions, pity and regard for the unhappy queen, the dubious counsels of Wolsey, and the imperious impatience of the king, and racked the while by the pains of a severe gout, the cardinal ended by displeasing all parties; and his final revoking of the cause to Rome led ultimately to the king's rupture with the papal court. Campeggio died at Rome in 1539.

Camper, PETER, anatomist, born at Leyden 11th May 1722, studied there, and became professor of Medicine in 1750 at Franeker, in 1755 at Amsterdam, and in 1765 at Groningen. In 1773 he resigned his post, and, on being elected a member of the state council in 1787, removed to the Hague, where he died, 7th April 1789. Camper was distinguished not only for the services he rendered to anatomy, surgery, obstetrics, and medical jurisprudence, but also as a promoter of the fine arts. He was remarkably skilful in pen-and-ink drawing, painted in oil, embossed, and even acquired considerable experience as a sculptor. For his observations on the facial angle, see article SKULL. His work on the connection of anatomy with the art of drawing was an important contribution to the theory of art. His collected writings, with plates, appeared at Paris (3 vols. 1803).

Camperdown (Dutch *Camperduin*), a broad tract of low dunes in North Holland, about 25 miles N. of Haarlem, separating the small hamlet of Camp from the German Ocean, is famous for the victory obtained off the coast here by Admiral Duncan (q.v.) over the Dutch fleet under Admiral van Winter, October 11, 1797. Duncan was created Viscount Duncan of Camperdown, his son (in 1831), Earl of Camperdown.

Camp Followers are the sutlers and dealers in smallwares who follow an army. In India, owing to the peculiar habits and customs of the natives, and the large number of servants retained by European troops, the camp followers sometimes number four times the actual force: comprising servants, grooms, grass-cutters, mule and camel drivers, water-carriers, sutlers, snake-charmers, dancers, conjurers, and women. Even in European armies they are necessary; they are at all times under the control of the commanding officer, but only subject to military law when in the field.

Camphausen, OTTO VON, Prussian statesman, was born, 21st October 1812, at Hunshoven, Rheinland, studied at Bonn, Heidelberg, Munich, and Berlin, and in 1845 became a counsellor of the ministry of finance. He was elected as a moderate Liberal to the Prussian diet in 1849, and in 1869 became finance minister. He succeeded in restoring prosperity, but conflict with Bismarck on

economic policy led to his resignation. He died 18th May 1896.

Camphausen, WILHELM (1818-85), German painter, was born at Dusseldorf, and from 1859 was professor in the art academy there. He was specially famous for battle-pieces—scenes from Cromwell's battles, the Thirty Years' War, the wars of 1866 and 1870—and painted many notable portraits of soldiers and equestrian figures.

Camphenes. See CAMPHORS.

Camphine, a name formerly applied to a variety of turpentine obtained from the *Pinus australis* of the southern states of America. It used to be used as an illuminant in Britain.

Camphors, or CAMPHENES (through the Arabic *kafir* from the Hindi or Malay *kapur*), are organic compounds of the *terpene* series of hydrocarbons, and are found with essential oils in many plants. They are extracted with the oils by steam. Common camphor of commerce is obtained chiefly from the Camphor Laurel (*Cinnamomum* (*Laurus*) *Camphora*), a tree of China, Japan, Formosa, and Cochín-China, which has been grown in Java and various parts of Malaya, in Ceylon, Jamaica, some parts of the United States, and in Italy. Practically the supply comes mainly from Japan and Formosa. By the ordinary old-fashioned method, the wood is cut into chips and distilled with water, the vapour of camphor rising with the steam being collected in the head of the still. In the refining process the grains of impure camphor are detached, and being introduced, along with a small proportion of quicklime, into a large globular glass vessel in quantities of about 10 lb., are reheated, when first the water rises in steam, and is allowed to escape at a small aperture; and thereafter, this aperture being closed, the camphor sublimates and resolidifies in the interior upper part of the flask as a semi-transparent cake, leaving all the impurities behind. The flasks are then cooled and broken by throwing cold water on them, and the camphor taken out and sent into market. The glass globes employed are called by an Italian name, *bombolo*, the sublimation of camphor having been first practised in Venice. Camphor is also sent into the market sublimed in almost powdery crystals, as 'flowers of camphor,' a very convenient form for pharmaceutical purposes.—Camphor was unknown to the Greeks and Romans, but has been highly valued since ancient times in the East, and was first brought to Europe by the Arabs. It is a white tough solid, slightly lighter than water, and having the formula $C_{10}H_{16}O$. It is very sparingly soluble in water, but freely soluble in alcohol, ether, acetic acid, and the essential oils. It fuses at $175^{\circ}C$, and boils at $204^{\circ}C$, but volatilises somewhat rapidly at ordinary temperatures. When set fire to, it burns with a white smoky flame. Thrown upon water, it floats, and may be set fire to, when the currents generated alike from the gradual solution of the camphor in the water and the irregular burning of the pieces cause a curious rotatory motion. It has a peculiar hot aromatic taste, and an agreeable characteristic odour.

Camphor is used alike in European and Oriental medicine, both internally and externally, as a temporary stimulant. It is frequently employed in gout and rheumatism. In small doses it acts as an anodyne and antispasmodic; in very large doses it is an irritant poison. It is generally reckoned an anaphrodisiac, although some maintain that it has an opposite action. Its alcoholic solution, and liniments in which it is the principal ingredient, are much used for external application in sprains and bruises, chilblains, chronic rheumatism, and paralysis. It is of use, combined with chloroform, for allaying pain in neuralgia and toothache. The

odour of camphor is very noxious to insects, and it is therefore much used for preserving natural history specimens; but its antiseptic value against influenza or cold is not to be relied on.

Since camphor has come to be widely used in making celluloid, it has been recognised that felling the tree is a wasteful process; distillation of young shoots is to be preferred. Analysis shows that the leaves of the camphor tree, even the fallen leaves, contain more camphor than the wood.

Borneo or Sumatra Camphor is the produce of *Dryobalanops aromatica*, a large tree of the order Dipterocarpaceae, and is similar to the Laurel Camphor of commerce, but has a more acid flavour. Its composition is $C_{10}H_{16}O$, and it can be converted into common camphor by the action of nitric acid. The same tree also yields a 'camphor oil' isomeric with oil of turpentine, $C_{10}H_{18}$. A third kind, of secondary value, is prepared at Canton from *Blumea balsamifera*, a tall herbaceous composite. Camphor is now used on a large scale in making celluloid and smokeless powder, in perfuming soap, and as a solvent in varnishing.

Artificial Camphor is made from oil of turpentine or its isomers. It resembles ordinary camphor in its physical properties.

Menthol, or peppermint camphor ($C_{10}H_{18}OH$), occurs in the volatile oils of *Mentha piperita*. It is used to allay pain in neuralgia and toothache, and as a disinfectant.

Thymol ($C_{10}H_{18}OH$) is obtained from wild Thyme, and is a member of the camphor series.

Camphuysen, DIRK RAFELSZ (1586-1627), Dutch poet, painter, and theologian, was born at Gorkum. He was deprived of his living, near Utrecht, for Arminianism. Some of the pictures attributed to him are by others believed to be the work of his nephew Raphael (1598-1657) and his great-nephew Govert Camphuysen (1624-74).

Campi, a family of artists of some note, at Cremona, in the middle and near the close of the 16th century. GIULIO CAMPI, the oldest brother (1500-72), studied painting, sculpture, and architecture under Giulio Romano, and has left a fine altar-piece at Cremona, full of the Venetian beauty of colouring.—ANTONIO CAMPI was a successful imitator of Correggio, and had some merit as an architect and engraver. He wrote a chronicle of his native place, and died after 1591.—VINCENTO CAMPI (died 1591) excelled in small figures; some of his portraits and paintings of fruits also are highly valued.—BERNARDINO CAMPI (1522-90) was the son of a goldsmith, and possibly a kinsman of the three brothers Campi. He studied first under Giulio, but soon excelled his master. Although he imitated the works of Titian with such success that it has been difficult to distinguish the copies from the originals, he is not purely Venetian in his style, but borrowed much from both Correggio and Raphael. Many of his works are found in Mantua and Cremona, and are highly valued.

Campinas (SÃO CARLOS DE), a town of Brazil, on a fertile plain, 44 miles NW. of São Paulo. There are large coffee and sugar plantations in the surrounding district. Pop. 30,000.

Campine, a coal mining district in the provinces of Antwerp and Limburg in Belgium (q.v.).

Campion is the common name of plants of the genera *Lychnis* (*Melandryum*) and *Silene* (q.v.).

Campion, EDMUND, the first English Jesuit martyr, nicknamed 'the pope's champion,' was born in 1540, the son of a London tradesman, and was educated at the new Bluecoat school and St John's College, Oxford. He became the most popular man at the university, but hankered after the old religion, which he had abandoned by taking

the new oath of supremacy, and by receiving deacon's orders in the Church of England. In 1569 he betook himself to Ireland to help in re-establishing Dublin University. But becoming suspected of leanings towards Rome, he escaped to Douai, and soon joined the Society of Jesus in Bohemia. In 1580 he was recalled from Prague, where he was professor of Rhetoric, to accompany Parsons on the Jesuit mission into England. His career in England was brief but eventful. For twelve months he eluded the pursuivants, while no man in the country was more talked of. The audacity of his controversial manifesto known as *Campion's 'Brag and challenge,'* which was followed by his *Decem Rationes*, printed at a secret press in Stonor Park, greatly irritated his opponents. In July 1581 he was caught at Lyford, and sent up to London, tied on horseback, with a paper stuck on his hat inscribed 'Campion, the Seditious Jesuit.' He was tried on a charge of conspiracy of which he was undoubtedly innocent; for, unlike his brethren Parsons, Holt, and others, he never meddled with political plots. The conferences held by him in the Tower and the proceedings of his trial made a considerable sensation. He was executed with two secular priests on December 1, 1581, and beatified by Leo XIII in 1886. See *Life* by Simpson (new ed. 1896).

Campion, or **CAMPIAN**, THOMAS, lyric poet and lutenist composer, prosodist and contrapuntist, was born, 12th February 1567, at Witham in Essex, son of an Irishman. He studied at Cambridge, Gray's Inn, and abroad, practised medicine, and died, 1st March 1620, in London. He published Latin *Poemata*, four *Books of Ayres* or songs with accompaniments, *Observations in the Art of English Poesie*, *Songs of Mourning* for Prince Henry, several *masques*, and a book on counterpoint. Though he railed at rhyme, he was a consummate master of rhymed verse. He wrote words not only for his own songs, but for those of his friend Philip Rosseter. See editions by Bullen (1889, 1913), Vivian (1909), and E. H. Fellowes (*Songs from Rosseter's Book of Airs*, 1922, et seq.); also Macdonagh, *Campion and the Art of English Poetry* (1913).

Camp-meetings, gatherings of devout persons, held usually in thinly-populated districts, and continued for several days at a time, are especially associated with Methodism in America. Their introduction into England (1799) led to the separation of the Primitive Methodists from the Wesleysans. See *BOURNE* (HUGH).

Campobasso, a town of South Italy, among the Apennines, 52 miles N. of Benevento by rail. It has several fine churches and important manufactures of cutlery. Pop. 14,400.—The province (formerly *Molise*) is very mountainous, and little of the land is cultivable. The chief industry is sheep-raising. Area, 1700 sq. m.; pop. about 349,000.

Campobello, two towns of Sicily. (1) CAMPOBELLO DI LICATA, 17 miles N. of Licata by rail, with sulphur mines; pop. 8000.—(2) CAMPOBELLO DI MAZZARO, 32 miles SSE. of Trapani by rail, with famous quarries, which were worked by the Romans; pop. 10,000.

Campo-Formio, a village of Northern Italy, 6 miles SW. of Udine, is celebrated for the treaty of peace here concluded on 17th October 1797 between Austria and the French Republic, whose army, under Bonaparte, after subjugating Italy (1796), had crossed the Noric Alps, and threatened Vienna. Austria ceded the Netherlands, Milan, and Mantua, and received as compensation Istria, Dalmatia, and the left bank of the Adige, with

the capital, Venice; while France took the remaining territory of Venice, its possessions in Albania, and the Ionian Islands.

Campomañes, PEDRO RODRIGUEZ, COUNT OF, Spanish statesman and writer, born in Asturias in 1723, held many posts under Charles III., and in 1789–91 was president of the council of state. He died February 3, 1802. Besides an account of the antiquities of Carthage, he published (1774) the first good Spanish treatise on political economy, and a work on the education of artisans (1775).

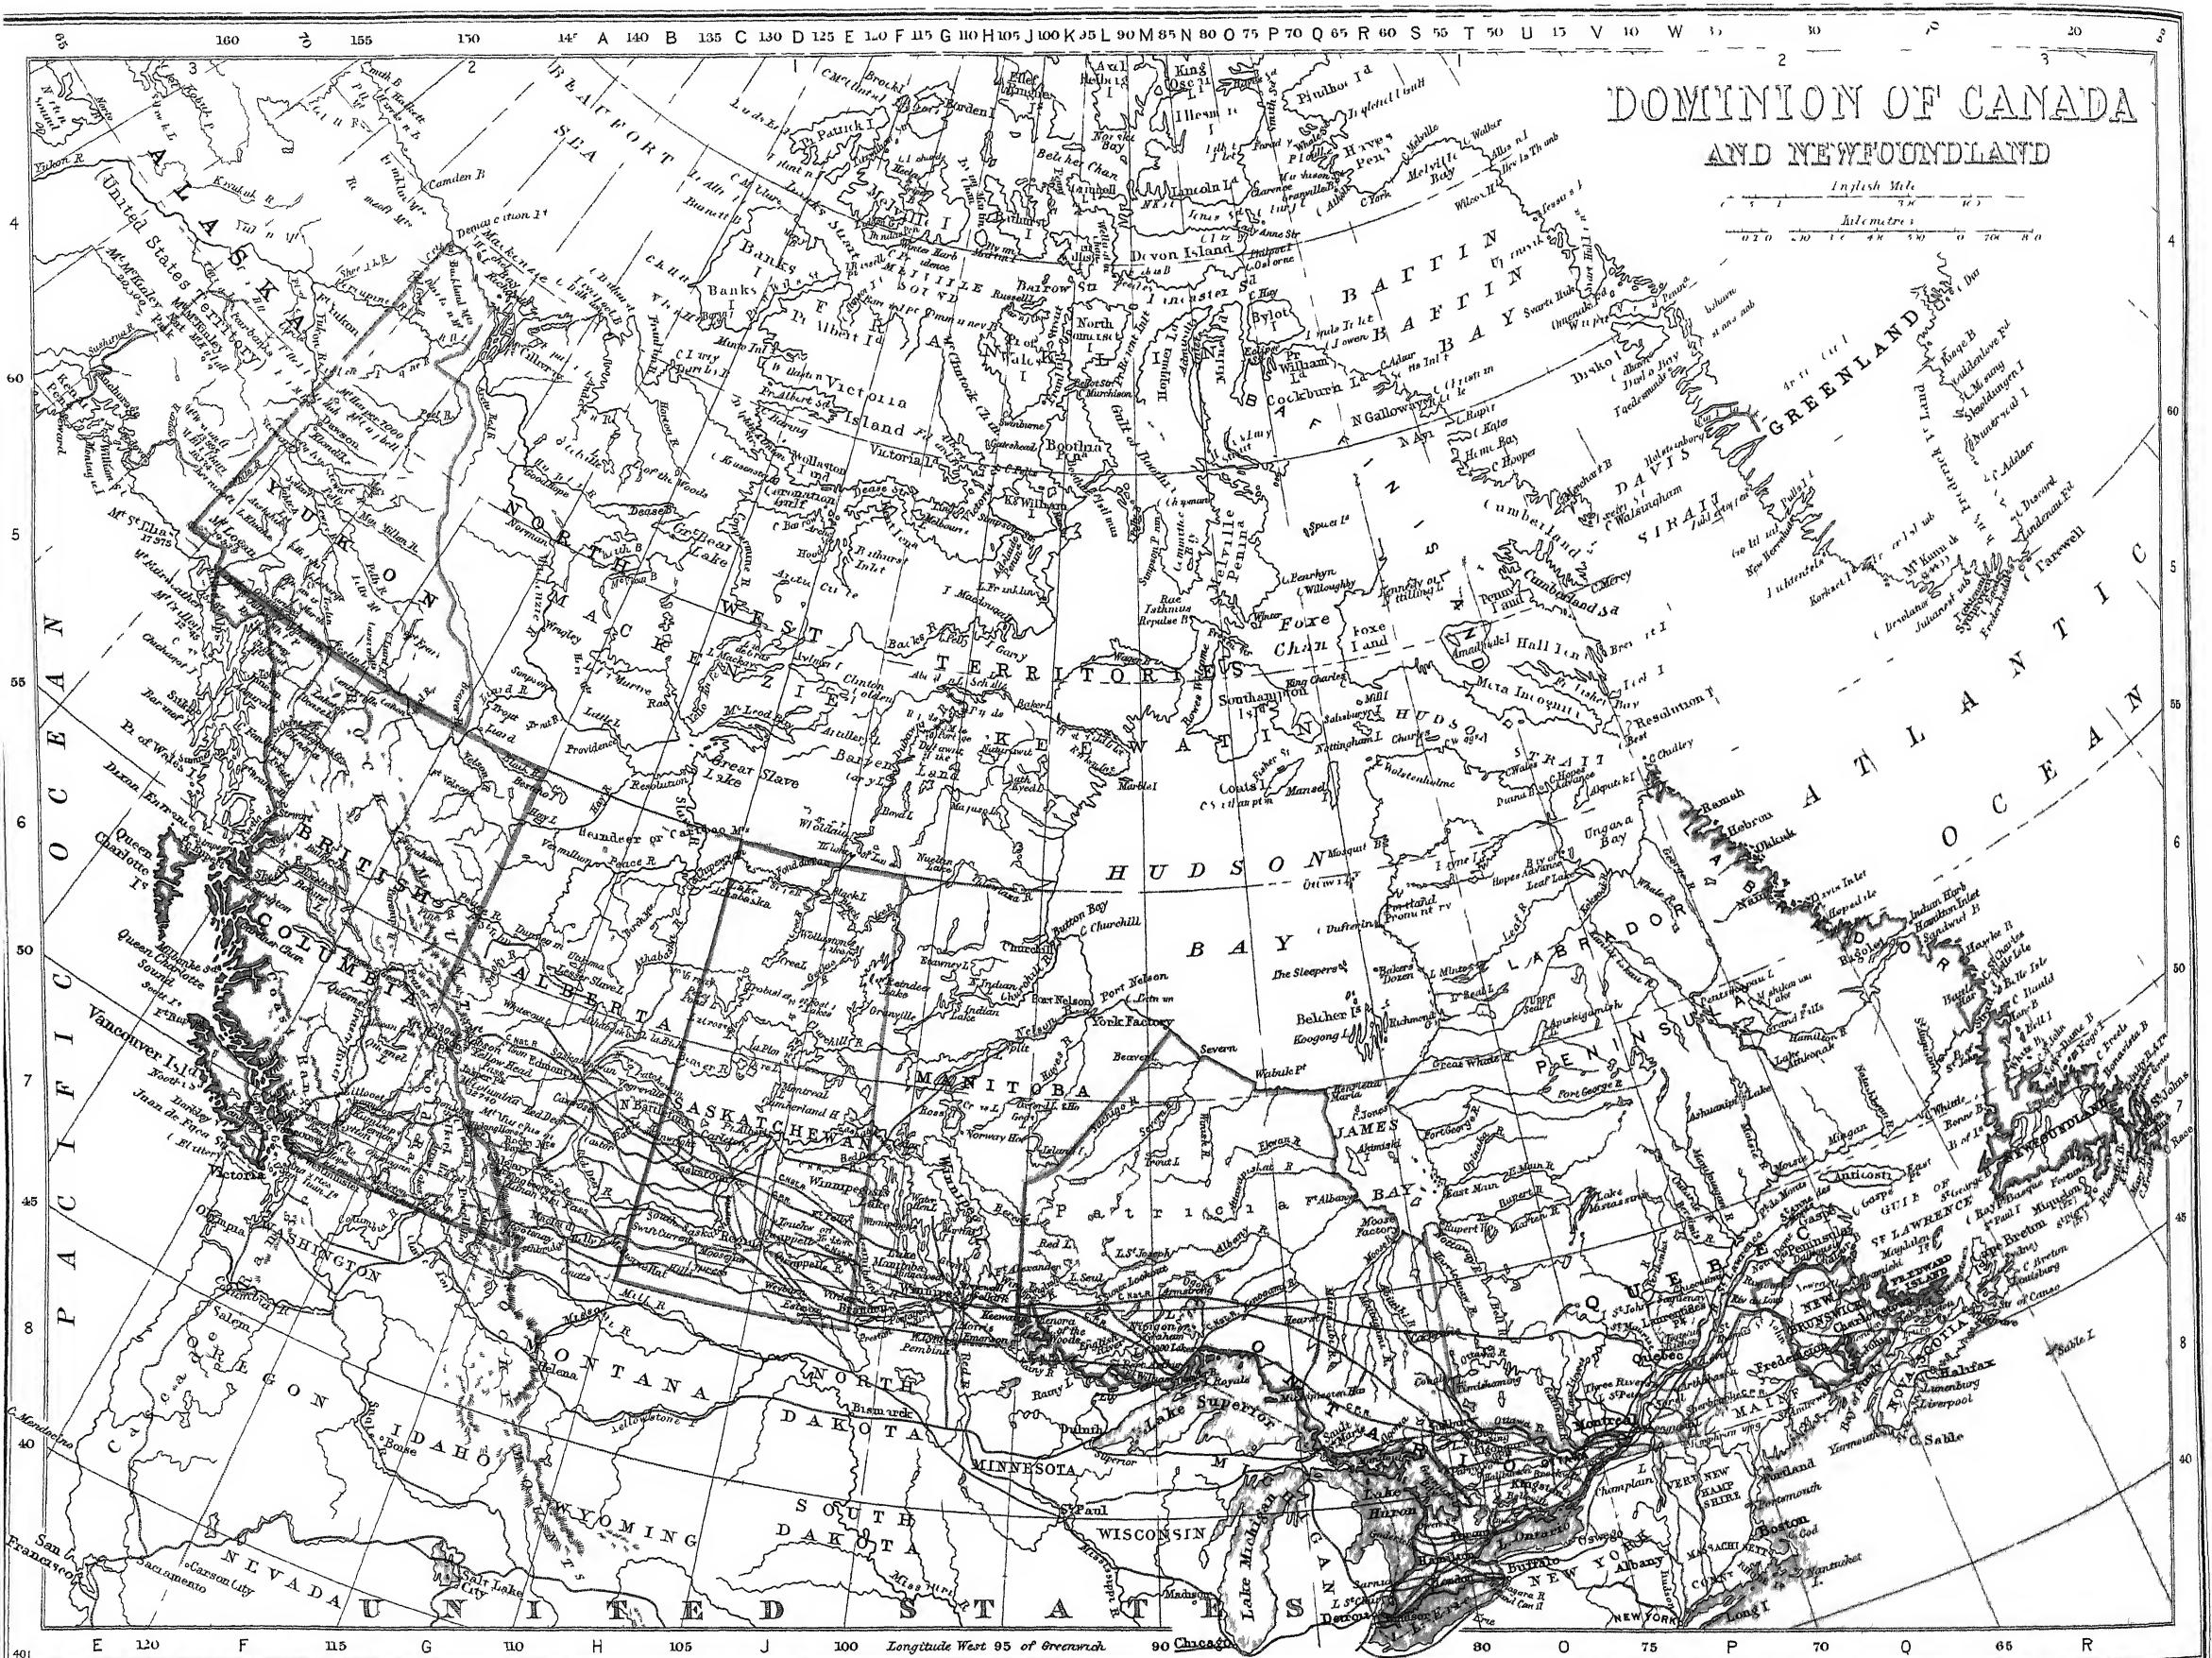

Campos, SÃO SALVADOR DOS, a town in the Brazilian state of Rio de Janeiro, on the Paralyba, which is navigable for small craft to this point, 30 miles from its mouth. It has some imposing buildings, fine wharves, sugar factories, and a trade in coffee, sugar, brandy, and timber. Pop. 70,000.

Câmpulung, or KIMPOLUNG, a town of Wallachia in a valley at the foot of the Carpathians, 80 miles NW. of Bucharest; pop. 15,000.—There is another Kimpolung in the extreme south of Bukovina; pop. 10,000.

Campvere, now called VEE, VEERE, or TER-VEER, and formerly often written CAMPHIRE, a small fortified town on the north-east of the island of Walcheren, in the Netherlands province of Zeeland, with a port on the Veergat, which separates Walcheren from North Beveland. The town has fallen into decay; but its former prosperity is indicated by such large edifices as the town-house and cathedral church. In 1304 Campvere was the scene of a battle between William, Governor of Holland, and Guy, Count of Flanders; in 1572 the Spaniards were driven away; and in 1809 the town was bombarded and occupied during the disastrous Walcheren expedition. For three and a half centuries it was the seat of a Scottish factory. Scottish trade with the Low Countries was of some importance as early as the end of the 13th century, and spite of English opposition grew in the next. At first Bruges was the headquarters of trade; when Bruges lost its commercial pre-eminence (after 1488) Campvere, Middelburg, and Antwerp competed for the monopoly of Scottish trade till 1541, when Campvere became the staple port. Here the Scottish merchants obtained various privileges and immunities; they had a conciergerie house or hotel; their Conservator exercised supreme authority over them; and from 1613 a regular Scots Kirk, minister, and manse were maintained here. In 1795, under the Batavian republic, the staple privileges were withdrawn and the factory broken up, but the conservatorship was held as a sinecure till the middle of the 19th century. The church, which ranked as part of the presbytery of Edinburgh, was broken up in 1799; a congregation at Middelburg was in some sense regarded as its successor, but in 1894 the general assembly of the Church of Scotland declined to receive a representative from Middelburg, while it left the Campvere church still on the roll of the assembly. See *The Scottish Staple at Veere* by Davidson and Gray (1909) and *The Scottish Staple in the Netherlands* by Rooseboom (1910).

Camuccini, VINCENZO (1775–1844), painter, born at Rome, became the head of a school founded on the theatrical antique style of David.

Camus, ARMAND GASTON, French revolutionist, was born at Paris in 1740. A zealous and ascetic Jansenist, and a master of ecclesiastical law, he was elected Advocate-general of the French clergy, and in 1789 member of the States-general by the people of Paris. He now appeared as the resolute foe of the ancient régime, gained possession of and published the so-called *Red Book*, with its details of expenditure so disadvantageous to the court and its

ministers. After the flight of Louis XVI., Camus, with Montmorin, Lafayette, and Bailly, accused the king of treason and conspiracy, and insisted on the suppression of all orders and corporations based on hereditary rights. As conservator of the national archives, he rendered an important service by preserving from destruction the old documents of the abolished corporations and institutions. He was absent in Belgium during the king's trial, but sent his vote for death. Early in 1793, while on his mission to make a prisoner of Dumouriez, Camus himself and his four colleagues were seized and delivered over to the Austrians; but, after an imprisonment of two and a half years, he was exchanged for the daughter of Louis XVI. On his return to Paris he was made member, and afterwards president, of the Council of Five Hundred, but resigned in May 1797, and devoted his time to literature. True to his principles, he voted against Napoleon's proposed life-consulship. He died of apoplexy, November 2, 1804.

Camwood, a dyewood obtained from *Baphia nitida*, a tree of the order Leguminosæ, a native of Angola. It is at first white, but turns red on exposure to air. It produces a finer and richer red than Brazil-wood (q.v.), and is very permanent. *Barwood*, very similar in its properties, but yielding a duller colour, is said to be produced by the same tree.

Canā, OF GALILEE, the scene of the 'beginning of miracles' described in St John's Gospel, chap. ii., and the birthplace of Nathanael, was situated in the neighbourhood of Capernaum, to the W. of the Sea of Galilee. Two modern villages claim to represent the sacred site, and good authorities are divided as to the identification. The one village, now called Kefer Kenna, is $4\frac{1}{2}$ miles NW. of Nazareth; the other, Kana el Jellil, is 9 miles N. of Nazareth. The spring of Ain Kana, still nearer Nazareth, has also been suggested as a probable site.

Canā. See DAHOMEY.

Canaan ('low-land') was the name originally applied to the low coast-land of Palestine on the Mediterranean, inhabited by the Canaanites (strictly so called), as opposed to the mountain-land (cf. Numbers, xiii. 29); and in this original sense the name is still applied in Isa. xxiii. 11, to the Phœnician, and in Zeph. ii. 5, to the Philistine coast-land. Just as with the name Palestine (= Philistia) at a later period, the name Canaan became extended to the whole country, yet only to the part west of the Jordan, the part east of Jordan being contrasted with it as the 'Land of Gilead.' The people and their progenitor (Gen. ix. 18 *et seq.*) were named after their dwelling-place, the Hebrew use of the verb *kana* ('nikhna' = 'to be bowed, sunken, subdued') readily lending itself to a reference to the conquest of the Canaanites. See PALESTINE.

Canaanites, in the Old Testament, a name very frequently used to include all the heathen inhabitants of the country between the Jordan and the Mediterranean. In the time of the Patriarchs they appear a people in some degree civilised, cultivating their lands and living in towns; and by the time of Joshua their country was thickly peopled, and studded with walled towns, each under its own king. Their religion was a licentious worship of Baal and Ashtoreth, as the productive powers of nature. Their subjugation by Joshua was merely temporary, and it was only by degrees that they were made tributary. The northern tribes of Israel were largely intermixed with the Canaanite element, as is shown many centuries later by the name Galilee ('circle of the heathen'). The tenacity of the Canaanite race is seen from the

fact that the fortress of the Jebusites (Jerusalem) was not conquered till the time of David, and that the remainder of the Canaanites were first reduced to vassalage by Solomon. According to Sayce, 'M. Clermont-Ganneau has shown that the present peasantry of Canaan are the descendants of the ancient Canaanites, partly of Semitic, and partly of non-Semitic blood. In many passages of the Old Testament the name *Canaanites* has its more restricted sense, signifying one of the peoples of Palestine which dwelt on the low ground on the sea-coast to the north of Carmel—i.e. the Phœnicians. Hence it is that the word 'Canaanite' sometimes is synonymous with 'merchant.' See PALESTINE, PHœNICIANS, HITTITES.

Canada, the great Dominion which occupies the northern part of North America and adjacent islands, exclusive of Alaska, Greenland, the Labrador coast, and Newfoundland. The name is believed to be derived from an Indian word, *kannatha*, meaning a village or collection of huts. Jacques Cartier, hearing the term used by the Indians in connection with their settlements, applied it to the whole of the country. Canada originally comprised the extensive range of territory as far west as the Mississippi, including the great lakes, which was ceded to Great Britain by France in 1763. At the termination of the War of Independence it was limited to the region now occupied by the older parts of the provinces of Ontario and Quebec, described prior to 1867 as Upper and Lower Canada respectively. The Dominion of Canada is a confederation of the colonies of British North America, constituted in 1867 by the British North America Act. Upper and Lower Canada, Nova Scotia, and New Brunswick were the first to unite under the provisions of that statute. The Hudson Bay territory was acquired from the company of that name; a portion of it was formed into the province of Manitoba, the remainder being called the North-west Territories; and both were admitted into the confederation in 1870. In 1871 British Columbia and in 1873 Prince Edward Island became parties to the union. Part of the North-west Territories was subsequently divided into provisional districts as follows: in 1876 Keewatin; in 1882 Assiniboia, Saskatchewan, Alberta, and Athabaska; and in 1905 the North-west Territories were formed from the territories formerly known as Rupert's Land and the North-western Territory, except such portions thereof as form the provinces of Manitoba, Saskatchewan, and Alberta, the district of Keewatin, and the Yukon Territory, together with all British territories and possessions in North America, and all islands adjacent to any such territories or possessions except the colony of Newfoundland and its dependencies. A subsequent act in the same year annexed Keewatin to the North-west Territories. In 1905 the two new provinces of Saskatchewan and Alberta were formed out of the provisional districts of Assiniboia, Saskatchewan, Alberta, and Athabaska by act of the Dominion parliament. In 1912 Quebec, Ontario, and Manitoba were extended to Hudson Bay, Quebec absorbing Ungava, and Ontario and Manitoba dividing Keewatin between them up to the 60th parallel. The North-west Territories were divided in 1920 (by Order in Council of 1918) into the districts of Mackenzie, Keewatin, and Franklin. The disputed Labrador boundary was referred to the Privy Council in 1920.

Canada is bounded on the N. by the Arctic Ocean, on the W. by the Pacific and Alaska, on the E. by Newfoundland (Labrador) and the Atlantic Ocean, and on the S. by the United States. From the Atlantic to the Pacific Ocean is approximately 3000 miles, and from north to

south of the Dominion approximately 1500 miles. The area of Canada is 3,729,665 sq. m., of which 3,603,336 sq. m. are land and 126,329 sq. m. are water. Canada is nearly as large as the whole of Europe. Both the Atlantic and Pacific shores abound in deep indentations, forming magnificent harbours and sheltered bays. On the Atlantic the Bay of Fundy is remarkable for its high and rushing tide, the water rising from 12 to 50 feet. Hudson Bay, connected with the Atlantic by Hudson Strait, is really an inland sea with an area of 450,000 sq. m. The Gulf of St Lawrence is 80,000 sq. m. in extent. The most striking physical features of Canada are the Rocky Mountains, the Laurentian Range, and the chain of immense fresh-water lakes. Hills of no great height skirt the coasts of Nova Scotia and Cape Breton, and the southern bank of the St Lawrence is fringed by the Notre Dame Mountains (also called the Shickshock Mountains), a spur of the Appalachians, the highest parts of which (4000 feet) are in Gaspé. The Laurentian Range extends along the north side of the St Lawrence, along the Ottawa River, and then stretches away to Lake Superior and the north, the length of the range being 3500 miles. It forms the watershed between Hudson Bay and the St Lawrence, and varies in height from 1000 to 3000 feet. The eastern portions of Canada are generally well timbered, as are also British Columbia, and Alberta and Saskatchewan north of the Saskatchewan. Westward of the Red River, between the 49th and 55th parallels, there is an immense fertile plain, which produces the finest wheat in the world. This plain extends nearly to the Rocky Mountains. These mountains consist of three chains with valleys between; the most easterly has the greatest elevation near the 52d parallel, where several peaks exceed 12,000 feet. The average height of the chain is from 7000 to 8000 feet. In the north, adjoining Alaska, is Mount Logan (19,850), and, on the dividing line, St Elias (18,000). Canada is well watered, the map presenting a network of lakes and rivers. The system of the St Lawrence alone, with the great lakes Superior, Huron, Erie, and Ontario (between the last are the celebrated Falls of Niagara), drains an area in Canada of 330,000 sq. m. The area of the great lakes is over 74,000 sq. m.—Lake Superior is 602 feet above the sea-level, and Lake Ontario 246 feet—and with their outlet they form the greatest fresh-water way in the world. The areas of the most important lakes are: Superior, 31,800 sq. m.; Huron, 23,200 sq. m.; Erie, 10,000; Ontario, 7260, all partly in the United States. Other important lakes are Winnipeg (9457 sq. m.), Winnipegosis (2086), Manitoba (1817), Reindeer (2437), Great Slave (10,719), Great Bear (11,821), and Athabaska (2482); and in Baffin Land, Nettilling and Amadjuak.

Next to the St Lawrence, the chief rivers are the Saskatchewan and the Winnipeg, flowing into Lake Winnipeg, and the Nelson, flowing from it into Hudson Bay; the Assiniboine and the Red River, which join their waters at Winnipeg and flow into Lake Winnipeg; the Albany and the Churchill, flowing into Hudson Bay; the Athabaska and the Peace Rivers, flowing into Lake Athabaska, and the Slave River, from it into Great Slave Lake; the Mackenzie, fed from both the Great Slave and the Great Bear Lake, and flowing into the Arctic Ocean; the Fraser and Thompson, in British Columbia, flowing into the Pacific; and in the eastern provinces, the Ottawa, chief tributary of the St Lawrence, itself fed by the Gatineau and Mattawa; the Saguenay, flowing from Lake St John into the St Lawrence; and the St John, which flows into the Bay of Fundy, after a course of 500 miles in New Brunswick, which it partly

separates from the state of Maine. The principal islands of the Dominion are: on the east, Cape Breton, Prince Edward and Magdalen Islands, and Anticosti, in the Gulf of St Lawrence; on the west, Vancouver Island and Queen Charlotte Islands. Lying along the north, in the great Arctic Archipelago, are immense islands, all of which, excepting Greenland, belong to Canada (Imperial Order in Council, 1st September 1880). See AMERICA.

Canada is of such vast extent and so varied in its geographical features that it is not surprising that its climate is most varied and interesting. In Vancouver Island and the lower levels of British Columbia near the sea the climate is very similar to that of Great Britain, with the decided advantage that the summers are drier and there is more sunshine than in the old land. To the eastward of the coast range of mountains the winters are rather cold and the summers hot, with a much smaller annual rainfall than near the coast. In the Okanagan valley peaches and grapes, and even figs and almonds, ripen in the open air. In Alberta the average winter is fairly cold, but the spring sets in early and the summer is quite warm, with hot days and cool nights, and a rainfall usually ample for the crops. In Saskatchewan and Manitoba the winter is colder than in Alberta. It sets in gradually about November, and from December to early March it is pretty cold. In some years there are very low dips in the temperature, but the air is dry and the atmosphere is perfectly clear and bracing. As a rule seeding begins about the end of April, and in some years earlier. The northern districts of Ontario, rich in forests and minerals, have a colder climate than the southern districts, where the peach and grape ripen as readily as in southern France, under skies almost as sunny and in latitudes the same as in northern Spain. In southern Ontario signs of spring begin to multiply early in April or indeed in March, and between the middle of May and the middle of September the whole district is included between the same isotherms as the greater portion of France; and it is only after a protracted autumn that winter sets in about the beginning of December. The winters are by no means severe; and while the summer months proper are distinctly warmer than in England, it is in but few districts that the mean temperature exceeds 70°—hence the heat is not excessive. The annual precipitation of the whole of Ontario lies between 30 and 40 inches, which is fairly evenly distributed throughout the year; in summer, however, the rain generally falls during thunderstorms, and cloudy or wet days are of rare occurrence. The summers in western Quebec are as warm as in western Ontario; in July the 70° isotherm passes not far south of Montreal, the 65° line passes through Quebec city, and most of the Gaspé Peninsula has a mean temperature somewhat below 60°. The winters are cold, but dry and bracing, and may very fairly be compared with those of Petrograd and Moscow. Zero temperatures, while not infrequent, are not the rule, and it is only on a few occasions in each winter that exceedingly cold dips are experienced. The third week in April sees the trees along the St Lawrence budding, and it is not until November that the last red sere leaves fall. The opening of spring in the Maritime Provinces is usually a little later than in southern and western Ontario and the North-west, and somewhat earlier than in the lower St Lawrence Valley; on the other hand, the summer lingers longer, especially in the Annapolis Valley. The summers are, as a rule, not quite so warm as in western Canada, great heat being seldom experienced except very occasionally in the inland stations of New Bruns-

wick. The average precipitation of these provinces is between 40 and 45 inches, except along the southern coast-line of Nova Scotia, where it is nearly 10 inches greater. The whole of Canada, except the region near the coast in British Columbia, is favoured with more sunshine than any portion of Great Britain, Germany, Holland, or northern France. Nearly all parts of the Dominion have an annual percentage of over 40, and a summer percentage of between 53 and 59.

The land areas of the different provinces of Canada are stated as follows: Ontario, 365,880 sq. m.; Quebec, 690,865; Nova Scotia, 21,068; New Brunswick, 27,911; Prince Edward Island, 2184; Manitoba, 231,926; British Columbia, 353,416; Alberta, 252,925; Saskatchewan, 242,808; North-west Territories, 1,207,926; Yukon, 206,427.

Population.—In 1825 the population of Upper and Lower Canada was estimated at 637,211; in 1851, 1,842,265; in 1861, 2,507,657. These figures exclude what are now known as the Maritime Provinces, the estimated population of which in 1861 was: New Brunswick, 252,047; Nova Scotia, 330,857; and Prince Edward Island, 80,857. In 1871, after confederation, the population of Canada (including seven provinces and the territories) was 3,689,257; in 1881, 4,324,810; in 1891, 4,833,239; in 1901, 5,371,315.

The population of Canada at the censuses of 1911 and 1921 was as follows:

	1911.	1921
Alberta	874,203	588,454
British Columbia	892,480	524,582
Manitoba	461,344	610,118
New Brunswick	351,859	387,876
Nova Scotia	402,338	528,837
Ontario	2,527,202	2,933,062
Prince Edward Island	93,728	88,615
Quebec	2,005,770	2,361,199
Saskatchewan	492,432	757,510
Yukon	8,512	4,157
North-west Territories	6,507	7,988
Royal Canadian Navy	—	485
Totals	7,206,043	8,788,483

The rural population was in 1911 3,925,679 and the urban 3,280,964, an increase in the rural since 1901 of 17.20 per cent., and in the urban of 62.28 per cent. In 1921 the numbers were 4,436,041 and 4,352,442, and the increases 12.75 and 32.59 per cent. In 1907-11 something like 2000 new towns sprang up in Canada. Yet only four cities, Montreal, Toronto, Winnipeg, and Vancouver, had over 100,000 inhabitants. To these in 1921 were added Hamilton and Ottawa.

The 20th century has seen an extraordinary increase of immigration, shown by the following figures:

Total Influx.	British Islands.	United States.	Other Countries.
1897.	21,716	11,883	2,412
1904.	146,266	65,359	43,052
1905.	189,034	86,795	57,910
1906 (9 months)	121,687	53,791	34,659
1907.	202,469	120,183	58,312
1908.	148,908	52,901	50,832
1909.	208,794	59,700	103,798
1910.	311,034	123,013	121,451
1911.	354,287	138,121	133,710
1912.	402,432	150,342	139,009
1913.	384,878	142,622	107,580
1918.	79,074	3,173	71,314
1919.	57,702	9,914	40,715
1920.	117,336	59,603	49,666

In 1913 the British immigrants were—English, 102,112; Scots, 29,128; Welsh, 1787; Irish, 9585. The following were the other nationalities:

United States.	107,651	Chinese	5,512
Italian	24,722	Finnish	3,188
Russian	24,485	Rumanian and Buko-	
Ruthenian and Galician	20,064	vinian	3,053
Hebrew	11,252	French	2,683
Polish	9,798	Belgian	2,651
German and Austrian	8,672	Swedish	2,481

In 1901-11 negroes and Indians decreased in numbers. There were 27,774 Chinese in Canada in 1911. English is generally spoken in the Dominion, but in some parts of the province of Quebec French is the only language understood. In the Dominion parliament and in the legislature of Quebec members may address the House in either language. The French spoken by some of the *habitants*, as the French-Canadian farmers of Quebec are called, is a patois which resembles the French of the 17th century more closely than the French of modern Paris. The songs of the French-Canadians, especially boat-songs, are many and interesting.

Indians.—In 1917 there were about 106,000 Indians and 3300 Eskimos in Canada. In localities where the Indians can be educated and civilised they have made much progress. They are self-supporting, and engage principally in agricultural pursuits and stock-raising, although many are still hunters and fishermen. The policy of the Indian Department, carried out through its agents, farming instructors, and schools, is designed to make the Indian independent of free assistance. About \$2,000,000 is expended annually on Indians. A system of residential and day schools is established, in which instruction is given in the branches of an ordinary English education, in farming, domestic employments, sewing, and manual training, and a considerable degree of success attends its operations.

Religion.—There is no state church in Canada, and the utmost religious liberty prevails. The Roman Catholics are most numerous, comprising at the census of 1911 more than a third of the whole population—namely, 2,833,041. Two-thirds of these were in Quebec. Next in numbers were the Presbyterians, with 1,115,324; then the Methodists, with 1,079,892; Anglicans, 1,043,017; Baptists, 382,666; Lutherans, 229,864; Orthodox, 88,507; Jews, 74,564; Mennonites, 44,611; Congregationalists, 34,054.

Education.—In 1846 compulsory taxation for the support of free and unsectarian schools was for the first time embodied in the law of Canada. The details differ somewhat in the various provinces, but, generally speaking, the system, which is more or less compulsory, is as follows: Every township is divided into sections sufficiently large for a school. Trustees are elected to manage the affairs, and the expenses are defrayed by local rates and provincial government grants. There are separate schools for Roman Catholics in Ontario, Alberta, Saskatchewan, and Quebec. Teachers are trained at normal schools at the public expense. For those who can afford it—and the cost is very small—there are schools of a higher grade, managed also by trustees. At these, as well as at many excellent private establishments, a classical education is given, and pupils are prepared for the professions. There are also colleges and universities open to youths prepared in the lower schools. Toronto, Kingston, Montreal, and other places have schools of medicine, and the leading religious denominations have institutions at which young men are prepared for the ministry. For the higher education of girls there are also schools. In no country in the world is good education more generally diffused than in Canada, and the highest prizes the country offers are open to all, rich and poor alike. The principal universities are, in the order in which they were founded, as follows: Dalhousie (Halifax, N.S.), 1820; McGill (Montreal), 1821; New Brunswick (Fredericton), 1828; Toronto, 1828; Queen's (Kingston), 1841; Laval (Montreal), 1852; Manitoba (Winnipeg), 1877; Saskatchewan (Saskatoon), 1912. The government also established (1874) the Royal Military College at Kingston. The following are the chief scientific societies: Royal Society of Canada; Natural History Society

of Montreal; Canadian Institute, Toronto; Nova Scotia Institute; Natural History Society, New Brunswick; and Scientific and Historical Society, Winnipeg.

Social Conditions.—The distinctions of caste do not exist to the same extent as in the mother-country, although there is a careful preservation of those traditions which give the general features to English society. Almost every farmer and agriculturist is the owner of his acres—he is his own master, and is free to do as he wills. This sense and state of independence permeates the whole social system, and produces a condition of freedom unknown in older countries. Canada is or has been ahead of the mother-country in many social questions. Thus, as regards the liquor traffic, prohibition prevails; by an act of the Dominion parliament in 1882 marriage with a deceased wife's sister was legalised; religious liberty prevails; there is practically free and unsectarian education; there is a free and liberal franchise; members of parliament are paid for their services; the parliament is quinquennial; and there is no system for legalising pauperism, although orphans and the helpless and aged of both sexes are not neglected.

Public Lands.—The public lands in the various provinces are under the control of the local governments, excepting in the case of Manitoba, Saskatchewan, Alberta, and the North-west Territories, also two tracts of land in British Columbia, one twenty miles on each side of the Canadian Pacific Railway, and the other east of the Rocky Mountains in the Peace River district, where the lands are retained by the Dominion government. Every encouragement is held out to immigration, free or almost free grants of land being obtainable in some of the provinces; while improved farms, with buildings, implements, and machinery, can be purchased from the holders on favourable terms in many parts.

Trade and Commerce.—The value of the imports into Canada for the year 1880 was \$86,489,747, \$71,782,349 being entered for consumption. The imports from the United Kingdom were 48 per cent. of the whole; from the United States, 40.8. In the year 1900 the total value imported was \$189,622,513, of which \$180,804,316 was for consumption; in 1910, \$391,852,692, of which \$375,833,016 was for consumption; in 1920, \$1,150,654,653. About a ninth of the 1920 imports came from Great Britain and Ireland, and two-thirds from the United States. The principal articles are: iron and steel, coal and coke, cotton goods, woollen goods, sugar, chemicals, petroleum and its products, wood and manufactures of wood, bread-stuffs, fruits, hides and skins, flax, hemp and jute and manufactures of, furs and fur goods, gutta-percha, oils, silk and silk goods, tea and tobacco. The total value of the exports in 1910 was \$1,259,203,294—over \$500,000,000 to the United States, and nearly as much to Great Britain and Ireland. The principal exports are wheat and wheat-flour, wood and wooden manufactures, cheese, silver, cattle, fish (salmon, cod, &c.), bacon and hams, copper, gold, apples, furs, hides and skins, agricultural implements, nickel, and paper. The large business which naturally takes place between the provinces it is impossible to estimate.

Defence.—There are now no imperial troops in Canada, the Canadian government having assumed the defence of the fortress of Halifax and the coaling station at Esquimalt in 1905. Besides the fortifications at Halifax and Esquimalt there are defences at St John, N.B., and near Quebec. The force available for land defence is the active militia, numbering about 100,000. Of this number, about 7000 of all arms form the permanent force, or regulars, available for service at all times, and

constituting the instructional force of the militia. They are distributed at various points throughout Canada, from Halifax to Esquimalt. Military service was made compulsory in 1917. In 1899-1901 Canada sent several strong contingents to South Africa to assist the mother-country in the Boer war. During the Great European War some 600,000 were enlisted, of whom 400,000 were sent overseas.

The North American squadrons of the imperial navy were withdrawn from the Atlantic and Pacific stations in 1905. In 1910 the Canadian government passed the Naval Service Act, providing for the creation of the Canadian 'Naval Service,' the construction of dockyards, &c., and the recruiting of men for this purpose in Canada. Arrangements were made for building the ships in Canada; but pending the establishment of the necessary plant, &c., the cruisers *Niobe* and *Rainbow* were purchased from the British government, and stationed at Halifax and Esquimalt respectively. Both were employed in the Great War.

The Fisheries are, as regards the area available, the largest in the world. The coast-line of the Atlantic provinces, from the Bay of Fundy to the Strait of Belle Isle, without taking into account the lesser bays and indentations, measures over 5600 miles, and along this stretch are to be found innumerable natural harbours and coves. On the Pacific coast, the province of British Columbia, owing to its immense number of islands, bays, and fjords, which form safe and easily accessible harbours, has a sea-washed shore of 7000 miles. On both the Atlantic and the Pacific coasts, and within the limits of the territorial waters, are to be found fish and mammals in greater abundance probably than anywhere else in the world. Apart from this extensive salt-water fishing area, there are in the numerous lakes of the various provinces no less than 220,000 square miles of fresh water abundantly stocked with many excellent species of food-fish. In the deep-sea fishery of the Atlantic the fish caught are principally cod, haddock, halibut, hake, and pollack. The commercial food-fish taken inshore are cod, hake, haddock, pollack, halibut, salmon, herring, mackerel, alewives, smelt, flounders, sardines, lobsters, and oysters. On the Pacific coast salmon is predominant, but halibut and herring are very abundant. In the inland lake fisheries the chief commercial fish caught are whitefish, pickerel, pike, sturgeon, and herring—the latter in the great lakes of the province of Ontario only—besides many other less important kinds. There are employed in the actual work of fishing in the whole of Canada about 9000 men on board of vessels, and 50,000 in the various kinds of boats. The Dominion government has done much to foster the fisheries of the country. Bounties have been paid to fishermen, according to the catch and size of vessels and boats, to encourage them in the building and outfitting of improved craft. Many fish-breeding establishments have been built throughout the Dominion, and from these millions of fry of various kinds are placed in the rivers and lakes.

Minerals.—The most valuable minerals are coal, nickel, iron, silver, copper, gold, asbestos, natural gas, lead, salt, mineral oils, and gypsum. Most of the other commercial minerals are also mined. The gold production is principally from British Columbia and the Yukon district; but it is also mined in Ontario, Quebec, and Nova Scotia. There are immense fields in all these districts yet to be opened up. Silver is produced principally in the Cobalt district, Ontario, which is one of the greatest silver-fields in the world, and in British Columbia, where it occurs with lead. Copper is mined principally in British Columbia, where operations are on

a large scale, and in Ontario, where it is produced with nickel. Quebec also has a copper output. Sudbury, Ontario, produces over half of the nickel of the world. The silver ores of Cobalt, Ontario, furnish most of the cobalt. The eastern townships of Quebec furnish most of the asbestos supply of the world. Lead is extensively mined in British Columbia. Iron is found in all parts of the Dominion, but the main production at present is from Ontario. There are very large coal-deposits in Nova Scotia, Alberta, and British Columbia, those of the mountains in Western Canada forming one of the most extensive fields in the world. Notwithstanding the duty against it, Western Canadian coal finds a market in Alaska and as far south as San Francisco. Much has been expected of the great oilfield of the Mackenzie basin.

Forests.—The forest products of Canada constitute one of her most important sources of wealth. They find their way to all parts of the world—to the United States, to the United Kingdom, and to Australia. The Canadian sawmills are extensive and well appointed. The industry in all its stages employs a large number of men, as well as affording freight to railways and shipping. Among the wood are the maple (hard and soft), elm, hickory, ironwood, pine, spruce, cedar, hemlock, walnut, oak, butternut, basswood, poplar, chestnut, rowan, willow, black and white birch, and many more.

Agriculture.—Agriculture is the most important industry in Canada, and for the benefit of the farming community the Dominion government has established and maintains numerous experimental farms in different parts of the country. There are also a number of agricultural colleges, some of which are maintained by the provincial governments. The one at Guelph and the Macdonald College at Montreal are institutions of the very first rank, and attract students from all over the world.

The principal grain-crops of the country are wheat and oats, followed by barley. Hay and clover, rye, potatoes, flax, buckwheat, alfalfa, turnips and other roots are also important. The dairying industry has assumed large proportions in the older provinces, and is also making good headway in the newer districts in the west. Fruit is extensively grown in Nova Scotia, Ontario, and British Columbia. Large quantities of apples are exported to Great Britain, and an export trade is also being developed in pears and peaches. In many parts of the country the breeding of fine cattle, horses, and sheep is carried on successfully, the province of Ontario being especially noted for the excellence of its live-stock. Of late foxes and other fur-bearing animals have been bred in growing numbers, especially in Prince Edward Island.

Manufactures.—Since 1878 the development in manufacturing industries has been marked; but on the whole it may be said that the manufactures of Canada are as yet in their infancy. Agricultural implements are made for home use, and exported. There is sugar-refining in Halifax and Montreal, Quebec has tan-yards and boot and shoe factories, and the manufacture of cotton and woollen goods is increasing. The manufacture of articles of wood (doors, window-sashes, &c.) has also greatly increased. Canada is remarkably rich in water-power, which is being developed, especially for wood-pulp and electrochemical industries.

Fiscal Policy.—The percentage of duty on the total value of goods imported, dutiable and free, in 1868 was 12 per cent.; in 1878 it was 13·74; in 1879 the 'national policy' was inaugurated, and a general increase in the tariff sanctioned by parliament. No restrictions exist as to trade

between the different provinces, and free trade holds within the Dominion. The Intercolonial Conference of 1894 at Ottawa resolved in favour of a customs arrangement between Great Britain and her colonies, by which trade within the empire should be placed on a more favourable footing than trade with foreigners, and in 1898 this arrangement came into force, a reduction of 25 per cent. on the duty in favour of British goods being granted. In 1900 the reduction was raised to 33½ per cent. On 12th April 1907 the new Preferential Tariff came in force, giving a substantial reduction on goods imported from the British empire into Canada, but not a uniform reduction on the general tariff, different articles bearing different reductions in rate on the general tariff. Tariff revision continued to be an important political question. The Liberal victory in the election of 1921 was a setback to the policy of a high tariff.

Railways.—There are about 50,000 miles of steam railway open in Canada, besides 2000 miles of electric railways. The Canadian Pacific Railway was completed from ocean to ocean in 1871–85, its construction being one of the conditions under which British Columbia joined the confederation in 1871. Prior to 1880 the work was undertaken by the government, but in that year the Canadian Pacific Railway Company was formed, and undertook to complete the line by 1891 in consideration of a subsidy of \$25,000,000 and 25,000,000 acres of land, and the transfer of those portions of the line already under construction by the government (700 miles) when completed. The railway was finished in December 1885, nearly six years before the stipulated time, and through-trains have since then run daily from the Atlantic to the Pacific. By this route the distance from Liverpool to Japan and China is shorter by 1000 miles than *via* New York and San Francisco; and this trans-continental line is shorter by 600 miles than any of those in the United States. The railway is not only of importance locally to Canada, as connecting the various provinces and opening up the vast western provinces for settlement, but it is of imperial importance as providing a new route to Australia and the East, available for commerce and for military and naval purposes (see next paragraph). From Winnipeg it passes westward through Regina, Moose Jaw, Medicine Hat, and Calgary, through the Rockies by the Kicking Horse Pass to the lower Fraser valley and Vancouver. The journey from Europe to Asia is made even shorter by a second route. The National Trans-continental Railway runs from Moncton to Winnipeg. Westward of Winnipeg its continuation, the Grand Trunk Pacific, strikes across prairie-land well to the north of the Canadian Pacific, to Edmonton, through the Rockies near Mount Robson and down part of the upper Fraser valley to Prince Rupert. This trans-continental route was completed in 1914. A third route, the Canadian Northern, by Edmonton to Vancouver, was completed in the same year. In 1911 a line from Le Pas, Manitoba, to Port Nelson on Hudson Bay was begun. Except the Canadian Pacific and some smaller lines, the railways of Canada have been nationalised and united as the Canadian National Railways.

Shipping and Waterways.—At the end of 1918 the number of vessels registered in Canada, including those for inland navigation, was 4400 steamers and 4200 sailing-vessels, the total net tonnage of steam and sailing vessels being over 1,000,000. The sea-going vessels entering the ports in 1920 had a tonnage of over 25,000,000; and of coasting-vessels, 28,400,000. There are regular lines of steamers between Great Britain and Canada. Under arrangement with the respective govern-

ments, and assisted by subsidies, there is a service of mail steamers between Vancouver and Australia in connection with the Canadian Pacific Railway. This company has also in connection with it a regular service of steamers between Vancouver and Australia, China, and Japan, by means of which London is brought within three weeks of Japan. The canals of Canada have a length of only some 270 miles, taken in themselves; but they render available more than 3000 miles of inland navigation. Canals and the river improvements have cost a large sum of money, and they are works of great utility and importance. By their means vessels from the lake ports can reach the Atlantic without breaking bulk. The channel of the St Lawrence has been deepened, and vessels of 5000 and 6000 tons now reach Montreal, 700 miles from the Atlantic Ocean. There are nearly 5 miles of wharves at that city, and every facility for loading and discharging ships. At Quebec, also, there are facilities for an immense shipping trade. There is a system of canals to overcome the St Lawrence rapids and the difference in the levels of the great lakes (600 feet), which affords uninterrupted navigation from the Strait of Belle Isle to the head of Lake Superior, a distance of 2384 miles, of which 71½ miles are canals. The river Ottawa is navigated from Ottawa to Montreal, and there are considerable stretches of navigation above Ottawa. The rapids at Carlton, about half-way between Ottawa and Montreal, are overcome by locks; another river and canal system opens navigation between Ottawa and Kingston, and another between Lake Champlain and the St Lawrence. In Nova Scotia the St Peter's Canal connects St Peter's Bay with the Bras d'Or lakes. There is also navigation on the lakes and rivers in the western provinces and in the North-west Territories. For the Hudson Bay route, see the article HUDSON BAY.

Telegraphs.—There are 52,000 miles of telegraph lines, of which 13,000 belong to government, the remainder owned by private companies. The Pacific telegraph cable between British Columbia and Australia and New Zealand, *via* Fiji, is doing much to promote commercial intercourse between these dominions and the mother-country. Wireless telegraphy is also in use. Telephones are universal.

Revenue, Expenditure, and Public Debt.—The revenue for the financial year 1921-22, under the 'Consolidated Fund' account, comprising general sources of revenue and expenditure, was about \$382,000,000, of which nearly \$106,700,000 was from customs, and nearly \$36,750,000 from excise. The expenditure under the same account was \$347,500,000, of which \$139,000,000 was on debt charges. The gross public debt in 1922 was \$2,900,000,000.

National Parks.—The Dominion has an extensive system of national parks—areas set apart for the public benefit and enjoyment, for the sake of scenery, game, or other interest. These parks are administered by the Federal Government, which lays out town sites in which lots are rented at a purely nominal sum, builds roads and bridges, cuts out trails, and protects the game, fish, and timber. In the Rocky Mountains Park, on the eastern slope of the Rockies, are the celebrated Hot Sulphur Springs of Banff; and in Jasper Park, where the two trans-continental lines of the National Railways enter the Yellowhead Pass, between Alberta and British Columbia, are other hot sulphur springs with a temperature of 126°. Yoho and Glacier Parks in British Columbia are run on similar lines to the parks east of the Rocky Mountains, and each possesses very distinctive features. They have been compared to Gothic and Roman styles respectively of nature's mountain architecture.

The Wainwright Buffalo Reserve of 160 sq. m. in Alberta contains a herd of pure-bred Bison (q.v.), which under the protective care of the government are increasing rapidly; whereas before they were secured by the Dominion they were rapidly decreasing, and in a few years would doubtless have become extinct. Lands near Fort Smith have been reserved for the bison discovered in 1920. Other Dominion parks are Waterton Lake, Elk Island, Moose Mountain, and St Lawrence Islands. These latter consist of about a dozen islands among the Thousand Islands group in the St Lawrence River in Ontario, which were taken over by the Dominion to preserve them for the people, since they were being rapidly bought up by millionaires for their own exclusive enjoyment.

Relation to the United States.—Between countries situated as are Canada and the United States it is inevitable that the relations should be close, complicated, and delicate. Specially troublesome were the Alaska (q.v.) frontier difficulty (finally adjusted in 1903), the Behring Sea seal-fishery question (see SEAL), and the rights of United States fishermen in Canadian waters. Reciprocity is sometimes discussed, especially in the prairie provinces, but the minds of the Canadian people turn more to the strengthening of the trade relations with Great Britain, with Australia, and with New Zealand. The Liberal Laurier government went to the country advocating commercial reciprocity with the United States, but was defeated by a large majority; a Conservative government, hostile to reciprocity, being formed under (Sir) R. L. Borden. The question of annexation, which at one time received some attention outside Canada, mainly through the writings of the late Professor Goldwin Smith, is dead, and few Canadians expect ever to see it revived. That independent representation at Washington should be sought was a natural consequence of the new status of Canada as a signatory of the peace treaties of 1919-20, and a member of the League of Nations.

Constitution.—The government is federal. The provinces have local legislatures. The executive government and authority of and over Canada is vested in the sovereign. The Governor-general for the time being, whose emoluments are paid out of the Canadian revenue, carries on the government in the name of his Majesty, with the assistance of a council, known as the cabinet, consisting of the heads of the various departments, which is responsible to the Canadian House of Commons. The Dominion parliament, which sits at Ottawa, consists of an Upper House, styled the Senate, and the House of Commons. The senators are nominated for life by the Governor-general in council. The Commons are elected every five years, unless the House be dissolved before its course has run. Quebec has 65 members; the other provinces have their representatives adjusted in proportion to population after every census. There is a special franchise distinct from that in force for the provincial assemblies; both are liberal and extensive. Women were enfranchised in 1917-18. The procedure is very much the same as in the imperial parliament at Westminster. At the head of each of the provinces is a Lieutenant-governor, appointed by the Governor in council and paid by the Dominion, who is the medium of communication between the provinces and the Federal Government. In Quebec and in Nova Scotia there are two Houses of legislature, but in the other provinces there are only single Houses. This, however, is a matter entirely within the control of the local authorities, as are also the election of members, franchise qualifications, and alteration of electoral districts. The executive in each province is responsible to the local legislature. The North-west Territories are

administered by a chief executive officer known as the Commissioner, under the direction of the Governor in council or the Minister of the Interior, the Commissioner having a council of not more than four in number to assist him. Yukon has a 'Gold Commissioner' and an elected territorial council. The powers of the respective Dominion and provincial parliaments, and the contributions to the revenues of the provinces from the Dominion treasury, are defined by the original act and amending acts. Legislation upon local matters is delegated, as a general rule, to the provinces. See **FEDERATIONS AND UNIONS**. There is also a very perfect system of municipal government throughout the Dominion. Both counties and townships have their local councils, which regulate the taxation for roads, schools, and other purposes, so that every man directly votes for the taxes he is called upon to pay. Local taxation is very light.

History.—In 1534 Jacques Cartier, a French navigator, a native of St Malo, set out from that port with two small vessels of 20 tons each, landed on the shores of Gaspé (now part of the province of Quebec), and took possession of the country in the name of his sovereign, Francis I. He went again in the following year, and reached a small bay opposite the island of Anticosti. This bay he named St Lawrence, and the name is now applied to the gulf and river up which he sailed before reaching Stadaconé, near the site of the present city of Quebec. Continuing his voyage, he arrived at Hochelaga, another Indian town, and gave it the name of Mont Royal (Montreal). After passing the winter at Stadaconé he returned to France. But little or nothing was done to promote the colonisation of the country until 1603, when Samuel Champlain, a Frenchman of gentle birth and maritime and military experience, and much religious enthusiasm, visited Canada for the third time, with the object of extending Christianity and developing trade and commerce, and founded the city of Quebec, the name of which is said to be derived from an Indian word, *kepek*, 'the narrows.' The control of the immense region, extending eastward to Acadia (Nova Scotia), westward to Lake Superior, and down the Mississippi as far as the Gulf of Mexico, was from this time until 1763 claimed by France (see **ACADIA**). Recollet and Jesuit missionaries traversed it in all directions, suffering great hardships in their endeavours to convert the Indians. Their work was watched with much enthusiasm in France, and it is admitted that they were the first explorers of the country and the pioneers of civilisation in the Far West.

The claims of France were not, however, undisputed, as is shown by the grant by a charter of Charles II. in 1670 to Prince Rupert and his company, known ever since as the Hudson Bay Company, of the exclusive right of trading in the territory watered by streams flowing into Hudson Bay. As already mentioned, they gave up their exclusive rights in 1689 on certain conditions—among others, a money payment of £300,000 and a large grant of land. The struggle between Great Britain and France for supremacy in North America was long and bitter, but it terminated finally in 1763 by the cession to the former, under the Treaty of Paris, of Canada with all its dependencies, except the islands of St Pierre and Miquelon, which were retained as fishing stations, not to be fortified or garrisoned. Hudson Bay with the adjacent territory, Nova Scotia, and Newfoundland had been previously transferred to England by the Treaty of Utrecht in 1713. The population of Canada in 1763 was about 70,000; of Nova Scotia, 8000. No time was lost in attempting to adapt British institutions to the new possession; but

considerable friction occurred for some years, and it was not altogether allayed by the passing in 1774 of what is known as the Quebec Act. This gave the French-Canadians the free exercise of their religion, and secured their civil rights, laws, and customs. It annexed large territories to Quebec, including that part of the United States now forming Minnesota, Wisconsin, Michigan, Ohio, Indiana, and Illinois, which passed from Great Britain in 1783. Quebec was eventually in 1791 divided into Upper and Lower Canada; but this did not prove satisfactory in either province, leading to conflicts between the popular and elected assemblies and the nominated or official councils, and ultimately to the rebellion in 1837–38.

In accordance with Lord Durham's recommendations, the two provinces were reunited in 1840 (population of Upper Canada, 450,000; of Lower Canada, 650,000), but the union was not a success politically, although it indirectly led to the great confederation in 1867. It should be mentioned that the inhabitants of Upper Canada consisted largely of United Empire loyalists, who adhered to British institutions, and who left the United States at the close of the War of Independence, while those of Lower Canada were almost exclusively French-Canadians. The representatives from each province in the united parliament were equal in number. Upper Canada, however, made greater progress than Lower Canada (the population in 1851 was 952,004 and 890,261 respectively, and in 1861, 1,396,061 and 1,111,566), and agitated for an additional number of members and claimed other concessions, but the demands were always opposed by the latter. The consequence was frequent legislative deadlocks and continual difficulties. Such was the state of things in 1864. It is now necessary to refer to the other colonies on the Atlantic and Pacific coasts. In 1770 St John Island (renamed Prince Edward Island in 1780), and in 1784 New Brunswick, were formed out of Nova Scotia into separate colonies. In 1858, owing to the rush for gold and the influx of population, British Columbia was made a crown colony, and in 1866 Vancouver Island was joined to it. In 1864 the Maritime Provinces were discussing the desirability of local confederation, and advantage of the opportunity was taken by Canada to propose a broader scheme to cover all British North America, and after several conferences a basis of union was agreed upon which resulted in the formation of the Dominion.

Since the confederation of the provinces, the chief events of importance may be put in the following tabular form:

- 1869. The Red River rebellion, which collapsed in August 1870, on the arrival at Fort Garry of the expedition under Colonel (Lord) Wolseley.
- 1871. Treaty of Washington, dealing, among other things, with the fisheries and the use of certain canals.
- 1873. Defeat of the Conservative ministry (Sir John Macdonald, premier) on Pacific Railway question.
- 1877. Award of the Halifax Fishery Commission in favour of Great Britain of 5,500,000 dollars, as representing the value of the fishing privileges granted to the United States, over and above the concessions made to Canada under the Washington Treaty.
- 1878. Defeat of the Liberal ministry of the Hon. A. Mackenzie.
- 1879. Adoption by new Conservative ministry of the higher customs tariff, called the national policy, as a measure of protection against the United States.
- 1880. Contract for construction of Canadian Pacific Railway signed; ratified by parliament in 1881.
- 1885. Outbreak of disturbances among the half-breeds, under Louis Riel, in the Saskatchewan district, North-west Territories, in March. Suppressed in July by the force under Major-general Middleton. The total force in the field was about 4000 men.

- of the Canadian militia. Louis Riel tried, condemned to death, and executed. Last spike of the Canadian Pacific Railway driven (November 7).
1886. The first through-train for the Pacific left Montreal (June 13).
1887. Local Act passed for construction of Red River Valley Railway to boundary line to connect with United States railways. Act disallowed by governor in council. Agreement arrived at between the British and United States governments to discuss fishery disputes in conference at Washington. British plenipotentiaries, Mr Chamberlain, Sir Lionel Sackville West, and Sir Charles Tupper.
1888. Treaty for the settlement of the fishery disputes signed by the British and United States representatives (Feb. 15), subject to ratification by legislatures of respective countries. Recognised right of Canada to fisheries in three-mile limit; United States fishing-vessels to be allowed to land, sell, and tranship cargoes only in cases of distress; may enter the ports for wood, water, shelter, and repairs; and, on obtaining a licence (given without charge), to purchase casual supplies and stores (excepting bait). Meantime, to avoid friction, a *modus vivendi* was offered, providing that United States fishing-vessels might have all the privileges mentioned above on payment of a tonnage licence fee of 150 dollars per ton. The United States Senate refused ratification. The *modus vivendi* subsequently renewed. Motion for unrestricted reciprocity between United States and Canada rejected by the Dominion House of Commons.
1889. Proposal that the governor-general should have independent action in foreign affairs disapproved by parliament. Act restoring the property of the Jesuits; petition against it disallowed by the government.
1891. Death of Sir John Macdonald. Some officials tried for corruption.
1892. Treaty of Arbitration between Great Britain, Canada, and the United States as to the rights of seal-fishing off Alaska and in Behring Sea.
1893. Award of the Behring Sea Arbitration Court. Establishment of direct steam communication between Canada and Australia. Ratification of the Behring Sea Treaty.
1894. Intercolonial conference at Ottawa on a Pacific cable between Canada and Australia, and the promotion of commercial intercourse between the Colonies and with Great Britain.
1895. Franco-Canadian commercial treaty.
1896. Religious educational troubles in Manitoba settled. (Sir) Wilfrid Laurier first French-Canadian and Catholic premier.
1897. New tariff favouring trade with Britain and the other colonies. Gold-fever at Klondike.
1898. Conference at Quebec between Britain, the United States, and Canada about the frontier of Alaska (q.v.), fishery regulations for the great lakes and the North Atlantic, the import duties on Canadian timber, alien labour laws, and reciprocity of trade between Canada and the United States.
- 1899-1902. 9200 Canadian troops sent to South African war.
1902. Completion of the Pacific cable to Australia.
1903. The Alaska boundary defined.
1905. Saskatchewan and Alberta, two new provinces, created.
1906. Canada takes control of Halifax garrison.
1907. New postal convention with United States. Quebec bridge disaster.
1908. French treaty.
1910. Award of Hague Tribunal finally settles fishery disputes between the United States on the one hand and Canada and Newfoundland on the other. Inception of Canadian navy by purchase of two warships from the British government.
1911. Overthrow of the Laurier (Liberal) government on the question of commercial reciprocity with the United States, and formation of a Conservative cabinet under (Sir) R. L. Borden.
1912. Preferential trade agreement between Canada and the West Indies arranged. Great Congress of the French race at Quebec, to consolidate their interests and promote the claims of their language.
- Destructive cyclone at Regina (30th June). Quebec, Ontario, and Manitoba extended.
1913. Trade agreement with West Indies.
1914. Great European War. Grand Trunk Pacific Railway and Canadian Northern Railway (Ontario section) completed.
1915. First Canadian contingent lands in France. First Canadian War Loan.
1916. Houses of Parliament, Ottawa, destroyed by fire.
1917. Sir R. L. Borden in Imperial Cabinet. Military Service Act. Quebec Bridge completed. Women's franchise (partial). Coalition ministry (Sir R. L. Borden). General election: no change.
1918. Women's franchise (extended).
1919. In the Peace Conference at Versailles and in the League of Nations Canada takes full rank as a nation. Death of Sir W. Laurier.
1920. Rebuilt Houses of Parliament opened. New trade agreement with West Indies. Mr Arthur Meighen succeeds Sir R. L. Borden as premier.
1921. Coalition defeated in general election. Mr William Lyon Mackenzie King, Liberal leader, becomes premier.
1926. General election. Liberals again victorious.

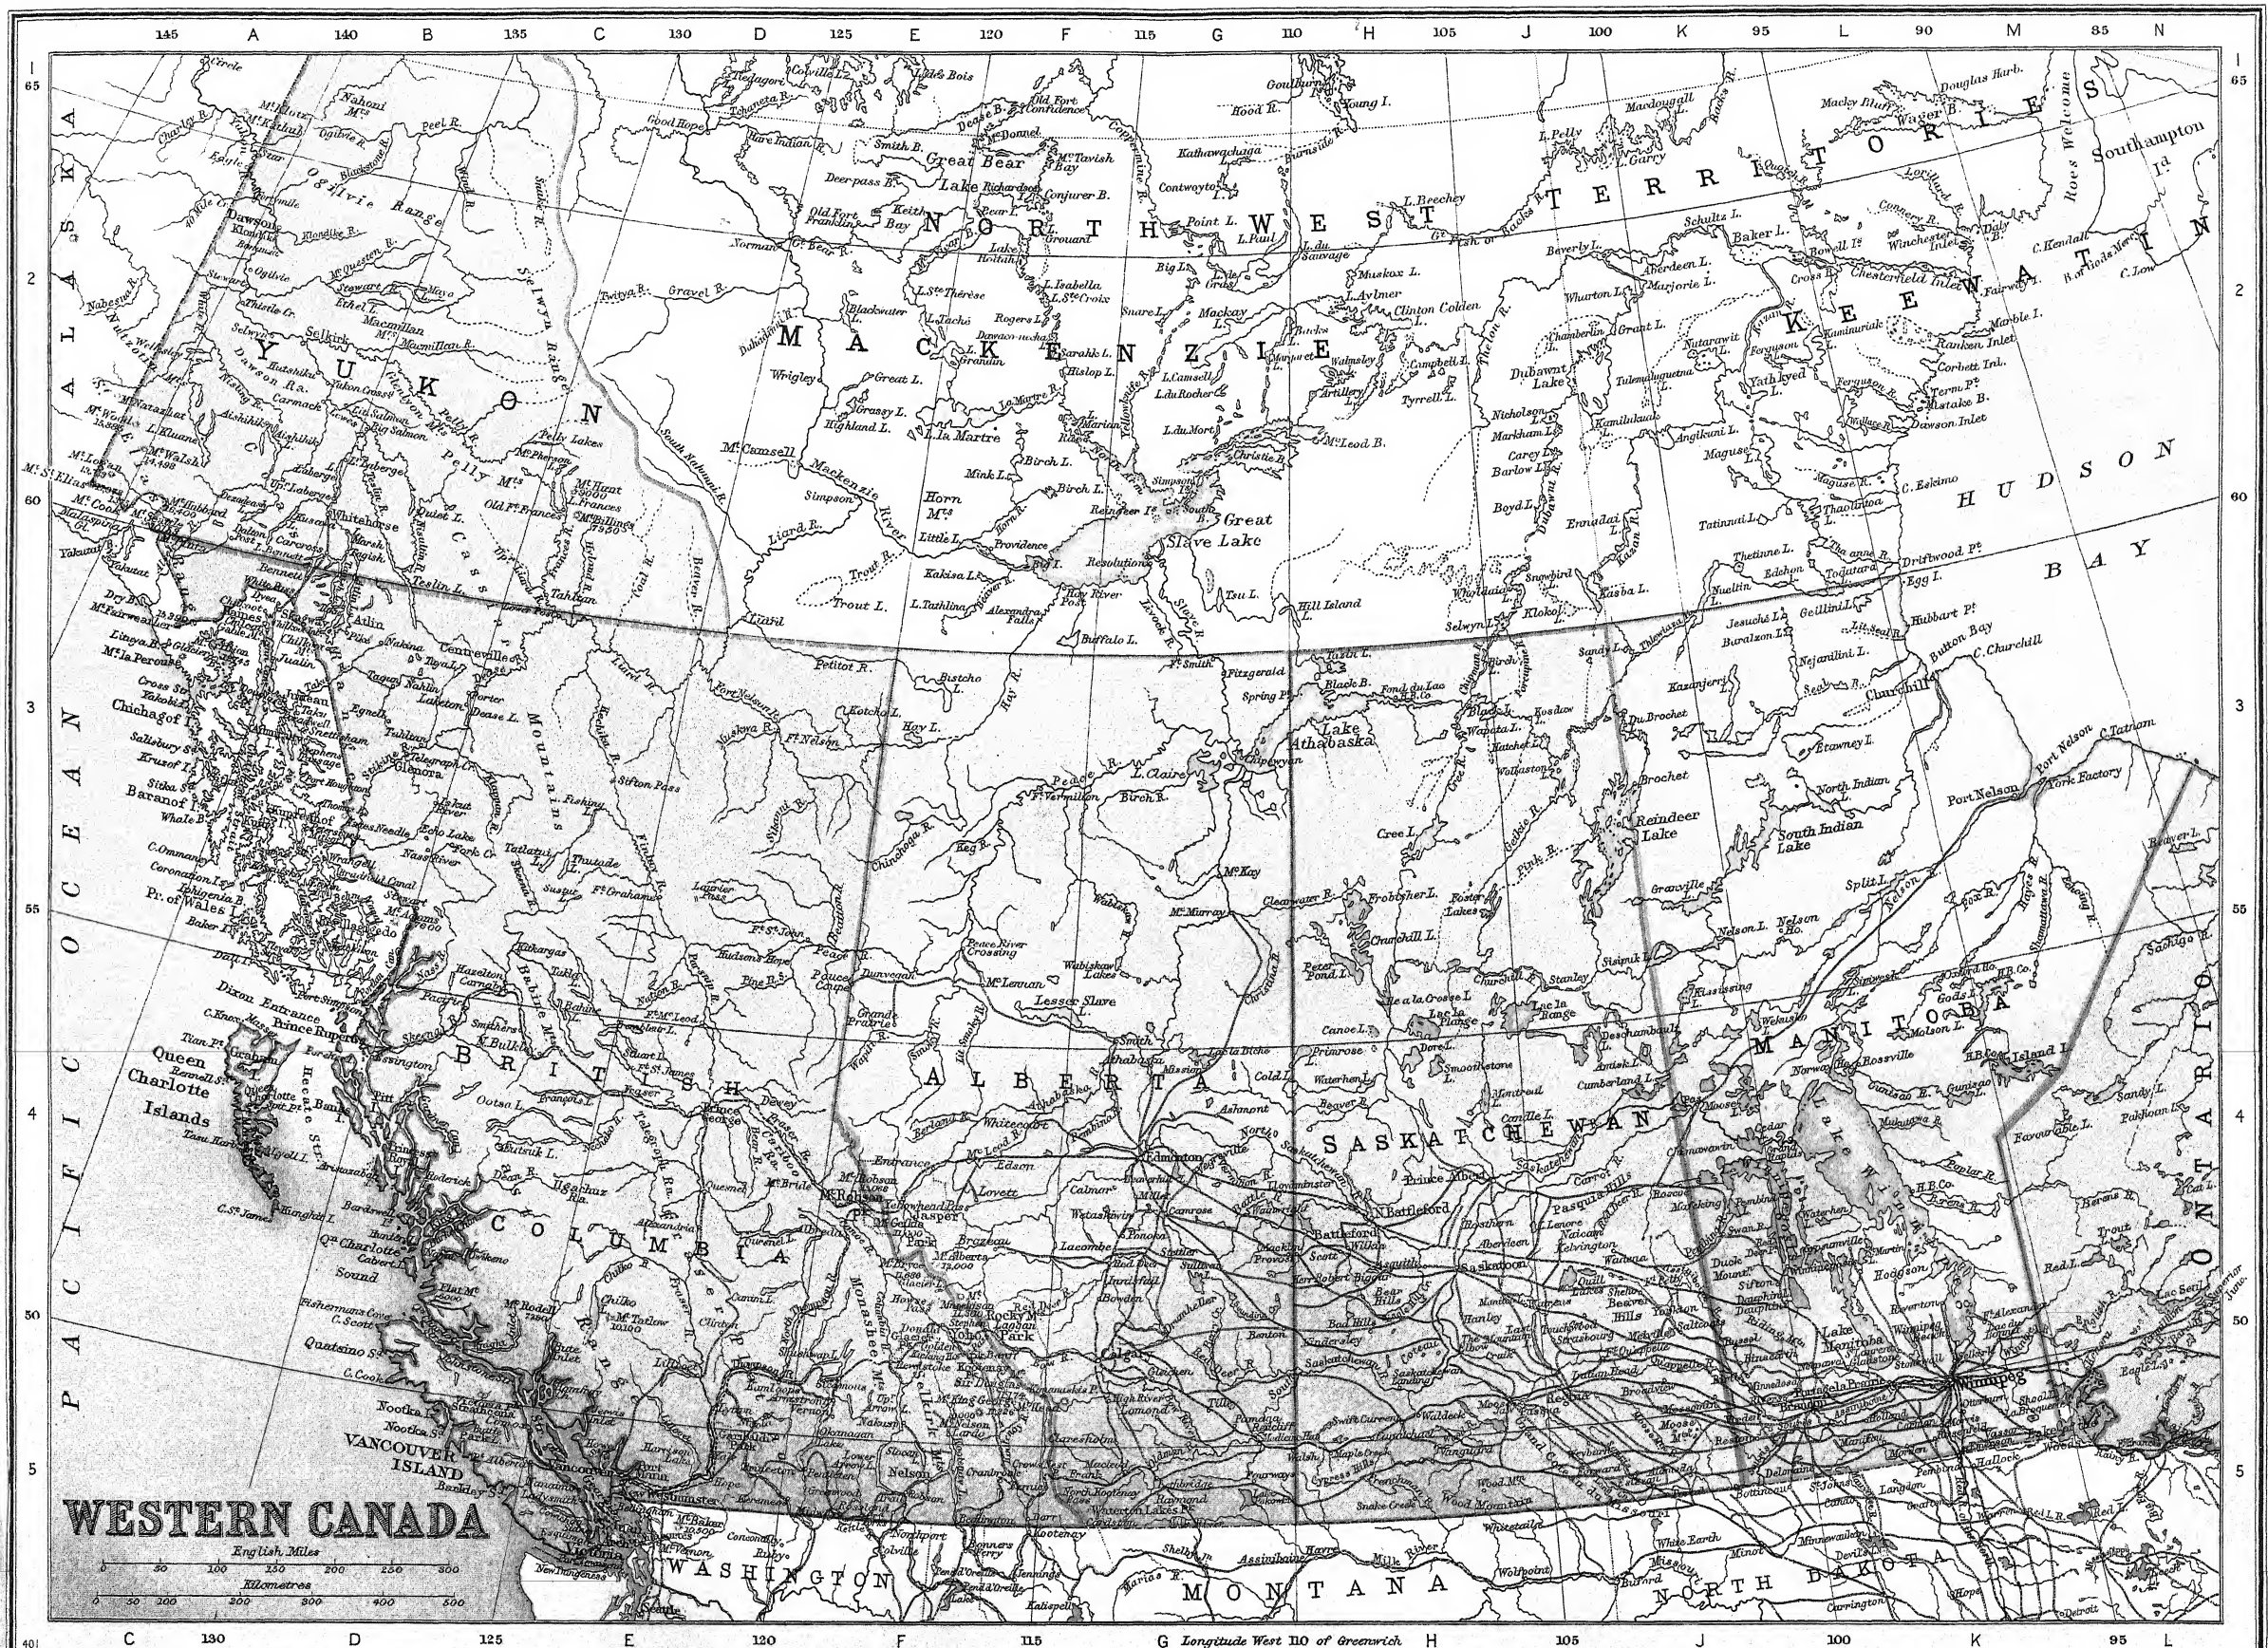

The governors-general of Canada since 1867 have been: Lord Monck (1867-68), Lord Liagar (1868-72), Lord Dufferin (1872-78), Lord Lorne (1878-83), Lord Lansdowne (1883-88), Lord Stanley of Preston (1888-93), Earl of Aberdeen (1893-98), Earl of Minto (1898-1904), Earl Grey (1904-11), Duke of Connaught (1911-16), Duke of Devonshire (1916-21), Lord Byng of Vimy (1921-26), Lord Willingdon.

The progress of Canada since confederation has been very rapid, but its varied resources are still in great measure undeveloped. Recent events, particularly the extension of railways and the completion of the trans-continental system, have placed Canada in a position of advantage which she had not previously occupied, and increased the volume of immigration to the immense areas of unoccupied, fertile lands; the agricultural, manufacturing, and mining industries are becoming more important every year; trade is expanding both at home and abroad; and the wealth of the people is rapidly becoming greater.

Literature.—Canada has been making steady progress in literature, and the future is full of promise in this respect; Judge Haliburton ('Sam Slick'), Joseph Howe, Sir William Edmond Logan, Sir William Dawson, Alpheus Todd (in Constitutional History), Bourinot, Grant Allen, G. J. Romanes, Simon Newcomb, Sir John Murray, and J. B. Crozier achieved a wide reputation at home and abroad. C. G. D. Roberts, Bliss Carman, Wilfred Campbell, and Duncan Scott are favourably known as poets, and Sir Gilbert Parker as a story-teller. L. H. Fréchette of Quebec was crowned (1880) the poet of the year by the French Academy. Other French-Canadian writers are Garneau, Chauveau, Poisson, Crémazie, Chapman, and Nelligan (the last two in spite of their un-French names). Dr W. H. Drummond (Irish-born) wrote humorous and tender poems in the mixed French-English patois of the *voyageurs* and half-breeds. Sir Daniel Wilson and Professor Goldwin Smith, like Mr R. W. Service and Professor Stephen Leacock, were only Canadian by adoption. Mr Bonar Law, the British Conservative leader, was Canadian-born.

Canada Balsam is a kind of Turpentine (q.v.) obtained from the Balsam Fir or Balm of Gilead Fir (*Abies balsamea*), a native of Canada and the northern parts of the United States (see FIR). It exists in the tree in vesicles between the bark and the wood, and is obtained by making incisions. It is a transparent liquid, almost colourless, and with an agreeable odour and acrid taste. It pours readily out of a vessel or bottle, and shortly dries up, and becomes solid. When fresh it is of the consistence of thin honey, but becomes viscid, and at last solid by age. It consists mainly of a resin dissolved in an essential oil, and its composition is approximately: essential oil, 24 parts; resin, soluble in boiling alcohol, 60; resin, soluble only in ether, 16. Canada balsam was formerly employed in medicine as a stimulant for the cure of mucous discharges, and as a detergent application to ulcers, but it is now rarely used as a remedy. The balsam is much valued for a variety of purposes in the arts—as an ingredient in varnishes, in mounting objects for the microscope, in Photography (q.v.), and by opticians as a cement, particularly for connecting the parts of achromatic lenses to the exclusion of moisture and dust. Its value depends on its perfect transparency, and on its having a refractive index nearly equal to that of glass. See BALSAM.

Canadian Hemp. See APOCYNACEÆ.

Canadian Pondweed. See ANACHARIS.

Canadian River rises in the N.E. part of New Mexico, and runs generally eastward through Texas and Oklahoma to the Arkansas. Its length is about 900 miles, but it is rather shallow and not important for navigation. Its largest tributary, the Rio Nutria, or North Fork of the Canadian, runs parallel to the main stream for about 600 miles.

Canaigre, a species of dock (*Rumex hymenosepalus*) found in Texas and New Mexico, whose root yields a tanning material.

Canaletto, or CANALÉ, the name of two Venetian painters, celebrated for their landscapes

and views of towns. The elder, ANTONIO, was born in 1697, and studied at Rome. He painted a series of views in Venice, among which those of the Grand Canal are especially admirable for their fresh colouring, faithfulness, and the invention displayed in accessory objects. He paid two visits to England, but died in his native city, 20th August 1768.—His nephew, BERNARDO BELLOTTO, surnamed CANALETTO, was born in 1720, and attained high excellence as a painter, and also as an engraver on copper. He practised his art in his native place, and afterwards in Rome, Verona, Brescia, Milan, and Dresden. Correct perspective, powerful effects of light and shade, and beautiful sky-tints are the most prominent characteristics of his works. Canaletto visited England, where, among several other excellent works, he painted a masterly interior of King's College Chapel, Cambridge. He died in Warsaw, 17th October 1780.

Canals are artificially constructed water-channels used for drainage of low-lying land, for irrigation purposes, or for navigation by boats, barges, or ships. The first canals were constructed in early times for irrigation in Assyria and Egypt, though they were also probably used for navigation.

Drainage Canals.—These are artificial water-courses to supplement the natural rivers in areas where the rivers have a small fall, and the adjacent lands, being low-lying, are liable to flooding in wet seasons unless artificial channels are provided as an additional means for the discharge of surplus rainfall. Many instances of such canals exist in Holland, in the Fen districts of Lincolnshire and Norfolk, where they are usually called cuts or drains, and even in such a generally dry country as Australia there are large areas where they have had to be provided in order to allow the land to be brought under cultivation. Such canals differ from Rivers (q.v.) merely in the fact that they are straight artificial cuts. Being usually constructed in districts where there is only a small slope to the sea, they must be given an exceptionally large cross-section in relation to the normal flow, since the discharge in any stream or canal is, other things being equal, determined by the amount of fall in feet per mile. Where flood discharges are likely to be heavy, inundations may be prevented by utilising the material excavated in forming the channel for embankments on either side, placed a little back from the edges of the cutting.

Irrigation Canals.—The purpose of such canals is to carry the waters of a river flowing through a hot, dry country to land at a distance from the river so as to preserve such land from the effects of drought and so increase its fertility. The two countries where this system of irrigation has been most extensively employed are Egypt and India, though very important works of this class have been carried out in Italy and Spain, and in more recent years in Colorado, California, and in Australia in the Murrumbidgee valley. Those canals are made with a regular slope or fall, and by increasing the fall a greater volume of water will be conveyed by a canal of given cross-section; but if the fall is too great, the scouring action of the water on the bed of the canal becomes injurious, as happened in the case of the Ganges Canal. Sluices and weirs have to be constructed at the intakes of such canals to regulate or shut off, if necessary, the supply. Provision has also to be made for the admission of the water from the main canal into the branch canals and trenches which distribute the water over the irrigated area. The details in regard to all these works appertain to Irrigation (q.v.), and the formulæ employed for determining the sizes of the canals, given the available fall and the volume of water required, are determined by the principles of hydro-mechanics.

Navigation Canals.—Though it is possible to utilise drainage and irrigation canals for navigation purposes, they are designed primarily for the passage of water; on the other hand, navigation canals are level still-water channels constructed as a waterway for vessels, just as roads and railways are formed for vehicles and trains. Canals differ, however, in one important aspect from roads and railways—they cannot adapt themselves by varying gradients to the irregularities of level of the country they traverse; they must consist of a series of level reaches, at different heights above datum, connected at their extremities by locks or other means for transferring boats from the level of one reach to that of the adjoining reach. As a result, the laying out of the route of a canal is a more difficult problem than that of railways, as it is necessary, without unduly lengthening the route, to secure as long level reaches as possible; cuttings, embankments, tunnels, and aqueducts are all employed to facilitate this object.

A canal should in general be wide enough to allow two of the largest barges or boats navigating it to pass easily; to avoid undue resistances to traction it is advisable to make the bottom width at least twice the greatest breadth of the boat, the depth one and a half times the greatest draught of the boat, and the section of the waterway about six times the greatest midship section of the boat, which means in Great Britain a bottom width of 25 to 30 feet, a top width of 40 to 50 feet, and a depth of 4 or 5 feet. The bottom is flat, the sides have slopes of $1\frac{1}{2}$ to $2\frac{1}{2}$ per foot of height, but in towns, and sometimes in other parts where it is advisable, vertical stone side walls are used; these form quays. In tunnels and deep cuttings the width is usually only sufficient for a single boat, passing places being provided at suitable intervals. On embankments and along cuttings in porous soils a watertight lining of well-puddled clay or concrete has to be employed in order to prevent leakage. To prevent erosion of the sides at the water-line by the wash produced by the moving boats it may be necessary to pitch the sides with stones. A towing-path along one side of the canal, raised about 2 feet above the water-level, affords facilities for haulage.

An ample supply of water is needed for all canals in order to make up the water losses due to leakage, evaporation, and lockage. Loss due to leakage can be reduced to a minimum by strict maintenance of the channel and by proper attention to lock gates; the loss by evaporation is proportional to the water surface, and is naturally greatest in the summer, when the supply of water is least. The expenditure of water in locking depends on the size of the lock chambers, the height of lift, and the amount of traffic on the canal. In low-lying districts and in river valleys there is usually no difficulty in supplying water to canals; the natural streams can be utilised to introduce a supply to the canal at various points. Where, however, a canal rises to the higher level and crosses a watershed—that is, when we have to deal with the summit-level reach—it is often difficult to obtain an adequate supply of water, and artificial reservoirs (see WATER) have to be constructed at such a level as to provide the necessary water by gravitation to the canal. Such reservoirs may be formed by building an embankment across the valley of a mountain stream, and thus storing up the winter flow of the stream. To reduce the difficulty due to loss of water in locking various other expedients have been adopted for raising and lowering vessels from one reach to the next, when the lift is considerable. Vessels may be transferred from one reach to the next by locks, inclines, or lifts.

Lock.—A lock is a watertight chamber constructed of wood, brickwork, masonry, or concrete, provided with gates at each end, which separates two adjacent reaches. This chamber can be filled or emptied by sluices, and this enables a vessel to be admitted from either reach, and then raised or lowered to the level of the next reach. Where the difference of level is great a series of locks is placed end to end in steps, forming what is called a flight of locks. When the traffic is large locks involve a considerable expenditure of water, for a lockful of water is used for each pair of boats passing a single lock when boats ascend and descend alternately. With a flight of locks there is the least expenditure of water when the boats ascend or descend in a series; on the other hand, each pair of boats passing up and down alternately requires as many lockfuls of water as there are locks in the flight. In order to save water a second flight is sometimes built alongside the first flight, the one flight being used by ascending, the other by descending, barges. Side ponds are also sometimes used, into which the upper layers of water can be discharged when emptying a lock, and used again for refilling the lock. See also the article LOCK.

Inclines.—Occasionally when water is scarce, and the lift is large, vessels are conveyed on an incline from one reach to the next on a special carriage running on rails, laid on the incline and controlled by a cable. The vessel may be lifted on a cradle out of the water, which is apt to set up severe strains in the vessel's hull, or it may be floated into a steel caisson or trough containing water, with gates at either end, the caisson being supported on a frame in such a manner that it remains horizontal as it moves up or down the incline. While this second method is better as regards the strains likely to be caused in the vessel's hull, it means that a much heavier load due to the water in the caisson has to be moved. By connecting the cables of the ascending and descending loads on to a drum at the top of the incline the power expended in the haulage is much reduced.

The first incline with counterbalanced carriages running on rails was employed on the Ketley Canal in Shropshire in 1788, the height of lift being 73 feet, and they were afterwards adopted on many other canals. On the Morris Canal in New Jersey, U.S.A., there are twenty-three inclines with an average lift of 58 feet, on which 80-ton boats are drawn in cars up an incline of 1 in 10. Caissons were first adopted on the Chard Canal in Somersetshire about 1840, and later, on a larger scale, at Blackhill, on the Monkland Canal near Glasgow, the lift being 96 feet, the incline replacing a double flight of locks. On the canal which connects the Chesapeake and Ohio Canal with the Potomac (U.S.A.), at the incline at Georgetown a caisson weighing when full 390 tons was put into operation in 1876; the incline is 1 in 12, and the lift 39 feet; boats of 115 tons are transferred from the lower to the upper reach in eight to sixteen minutes, steel cables are employed, and power is obtained from water-turbines.

Lifts.—A canal lift consists of two steel troughs filled with water, which counterbalance one another, one going up as the other descends vertically. The lift has various advantages over a flight of locks; it economises water, time, and space, and in certain circumstances the cost of construction may be less.

Hydraulic canal lifts were introduced in 1875 at Anderton for connecting the Weaver with the Trent and Mersey Canal, the lift being 50½ feet. This lift consists of two troughs, 75 feet long by 15½ feet wide, containing 5 feet of water; each trough is supported in the centre by a hydraulic

ram. These two troughs balance one another, and the lift is mainly obtained by removing 6 inches in depth of the water from the lower trough, the final part of the lift being obtained by the use of the 36-inch diameter ram under this trough. A barge of 100 tons can be lifted in two and a half minutes, and barges can be transferred from one level to the other in both directions in eight minutes; on a flight of locks for a similar lift over an hour would be required for this operation. Another example is the lift at Les Fontinettes near St Omer, France, where the lift is 43 feet, and the troughs are $132\frac{1}{2}$ by $18\frac{1}{2}$ feet, with a depth of water of $6\frac{1}{2}$ feet; this replaced also a flight of locks, and can deal with vessels of 250 tons, and a total load of 785 tons. At La Louvière, in Belgium, where there was a difference of level of 220 feet in 5 miles, four lifts have been employed of still larger capacity, capable of lifting vessels of 400 tons, with a total load of 1100 tons.

Haulage.—The typical method in small canals is still horse-haulage, the horse walking along the tow-path. This is a very slow method of transport; a horse hauls a loaded narrow boat at about 2 miles per hour, and when empty at about 3 miles per hour. The difficulty in introducing any quicker method is the damage to the banks by wash when the speed exceeds $3\frac{1}{2}$ miles per hour. For every depth of canal there is maximum speed for economy, due to the speed of free propagation of the primary wave set up by the movement of the barge. On larger canals steam haulage is utilised; steam-tugs hauling trains of barges as on rivers are employed. The Aire and Calder Navigation affords a good instance of the application of this method. Cable traction has also been employed, and electric tractors running on rails have been used.

Inland Canals.—The invention of locks in the 14th or 15th century made possible the modern development of canals for the transport of goods. The Languedoc Canal (Canal du Midi) may be looked upon as the first important navigation canal constructed in Europe (1666-81). It was designed by Baron Paul Riquet de Bonrepos, and provided direct connection of the Bay of Biscay with the Mediterranean, thus avoiding the long detour by the Straits of Gibraltar. The canal is 148 miles long, rises 600 feet above sea-level at Naurouse, the number of locks being 119, and the depth of water $6\frac{1}{2}$ feet, suitable for vessels of 100 tons. It is proposed to enlarge the canal so as to render it available for sea-going vessels. The French government has pursued a vigorous policy of development of inland waterways, and a large proportion of the bulky goods are conveyed by water in France. There are about 3000 miles of canals and over 4000 miles of navigable rivers in that country, many of the waterways being free of all tolls, the costs of maintenance and construction being borne by the state. In 1879 a law was passed fixing definite dimensions of all locks, depth of water in the channels, headway under bridges, &c., and when the alterations involved are all carried out it will be possible for boats of 300 tons with 6 feet draught to traverse all the principal waterways of France.

Canals were introduced into Holland and Belgium in the 12th century, and being, in that flat country, practically independent of locks, they were rapidly developed, until at the present time no other countries are better provided with inland waterways.

In Russia, Peter the Great began the construction in the 18th century of an important system of canals. The Volga and the Neva are connected by a canal which permits the passage of vessels of 500 to 1000 tons; other canals of equal importance have been constructed or planned, including one joining the Volga and the Don, thus providing a

passage from the former, greatest of all European rivers, to the Black Sea.

In Great Britain the earliest canals were the Foss Dyke and the Caer Dyke, constructed by the Romans, the former being still navigable; it extends from Lincoln to the river Trent at Torksey. It was not, however, till the close of the 17th century that modern canal construction began in this country, when the Aire and Calder Navigation was opened; but it was to the energy and resources of the Duke of Bridgewater (q.v.) and to the engineering skill of James Brindley (q.v.) that we owe our present system of canals, the first extensive work they undertook being the Bridgewater Canal, opened in 1772. From 1788 to 1805 there was a period of intensive activity in canal construction; a canal mania, similar in many ways to the railway mania of later days, lasted from 1791 to 1794. After 1834, when the railway development had fairly started, canal construction came to an end. There are about 3050 miles of canals in England, 154 miles in Scotland, 609 miles in Ireland, or a total of 3813. The traffic on many of these canals has now diminished to a very low figure, but some of them still maintain a heavy traffic, and compete successfully with railways. Unfortunately many of the canals fell into the hands of railway companies, who allowed their canals in many instances to fall into disuse. Had they been modernised and standardised, as has been the case in France, there is little doubt that a good traffic could have been maintained, with great advantage to the country as a whole. A royal commission was appointed in 1906 to report on the whole subject of internal waterways in this country, and if the proposals in their report of December 1909 are fully carried out, there will be a great development of this system for the transport of heavy, bulky goods, which do not require such rapid transportation as is provided by railways. The most important canals in Great Britain are the Gloucester and Berkeley Canal, 17 miles in length, with a depth of 15 feet; the Aire and Calder Navigation, with a depth of 9 feet; the Caledonian Canal (q.v.), with a depth of 17 feet; and the Forth and Clyde Canal, with a depth of 10 feet.

North America, with its vast extent and large rivers and lakes, affords ample scope for canals uniting separate navigations. The first canal in the United States was constructed in 1793, and there was from this period onwards a great development, until further expansion was greatly checked by the growth of the railway system. The most noteworthy canals in the United States are the Erie Canal, which connects Lake Erie with the Hudson River, which has a length of $365\frac{1}{2}$ miles, and a total rise of $656\frac{1}{2}$ feet, and a depth of $7\frac{1}{2}$ to $9\frac{1}{2}$ feet, sufficient for vessels of 240 tons; and the Chesapeake and Ohio Canal, of about the same size as the former. In Canada the artificial waterways so far constructed are largely 'lateral' canals, built to allow vessels to avoid the rapids in the rivers—such, for example, as the Welland Canal, avoiding the rapids and the falls of Niagara, and the St Lawrence Canal between Lake Ontario and Montreal. These canals have been greatly increased in depth and cross-sections since their first construction, and many millions sterling have been expended in the work, with a view of facilitating and cheapening the transport of the enormous grain crops of western Canada to the eastern shipping ports.

Ship-canals.—These are canals of large dimensions, capable of admitting vessels of great size, such as large ocean-going steamers. They are designed either to cut across isthmuses, and thus greatly reduce the distance by sea between certain countries—the Suez, Corinth, and Panamá Canals are

instances of this type—or to place great inland towns in direct communication with the sea—as, for example, in the case of the Manchester and the Amsterdam Canals—or they may be primarily intended for military defence purposes, though at the same time ostensibly for commercial development, as was the case with the Kiel Canal.

Suez Canal.—A canal connecting the Nile Delta with the Red Sea was constructed probably by Rameses II., and we have early Egyptian records of the existence of such a canal. It apparently became blocked, but was reopened about 520 B.C. by King Darius I. of Persia. During the Roman period certain repairs were carried out; but it was the Arab conquerors of Egypt who again thoroughly repaired and cleared the canal, making it serviceable for navigation. Part of this old canal was used in connection with the construction of the Sweet Water Canal during the building of the present Suez Canal.

The project of direct communication between the Mediterranean and the Red Sea had been under

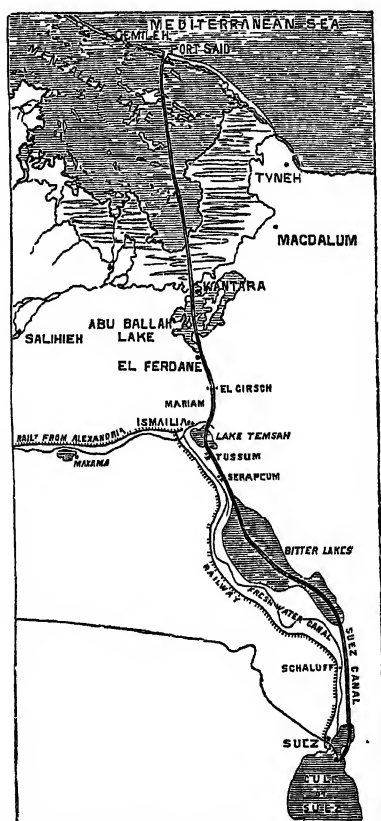

Fig. 1.—Map of Suez Canal.

consideration from as early as the 15th century, but it was not till Napoleon commissioned the engineer Lepère in 1798 to examine and report as to the practicability of the scheme that any definite steps were taken to test the possibility of carrying out such a work. Unfortunately Lepère came to the conclusion, as the result of his survey, that the Mediterranean was about 30 feet lower in level than the Red Sea, and this for the time put an end to the project. Later on Lepère's error was detected. The French diplomat De Lesseps (q.v.) in 1849 began to study the problem, and in 1854 he

secured the support of the new viceroy Said Pasha, who gave De Lesseps a concession authorising the promotion of a company to construct a ship-canal across the isthmus, and the Universal Company of the Maritime Suez Canal was formed, receiving valuable concessions from the Egyptian viceroy. In a further concession granted in 1856 the company agreed to construct, in addition to the lock-free maritime canal, a fresh-water canal from the Nile to Lake Timsah, with branches from this point to the northern and southern ends of the sea canal. The concession was for a period of ninety-nine years from the date of the opening of the maritime canal. The confirmation of the sultan of Turkey was necessary to validate these concessions, but, owing to British opposition, this confirmation was not actually granted till 1866. In the meantime the necessary capital was raised, mainly in France and in the Ottoman Empire, practically no support being obtained from Great Britain. On 25th April 1859 the first spadeful of earth was turned at Port Said, the Mediterranean terminus of the canal. Progress was at first slow, and in 1862 further delay was caused by the necessity of completing the fresh-water canal. Up to this date the work had been mainly carried out by native labour, as laid down by the two concessions. But in 1863 Said Pasha died, and the new khedive, Ismail Pasha, refused to sanction the continuance of this forced labour scheme; the khedive also refused to ratify the concessions originally granted to the company. These disputes were eventually settled by the matter being referred for arbitration to the Emperor Napoleon III., and the company received as a compensation for cancellation of certain parts of the concessions £3,800,000. When forced labour was stopped the whole remaining work was divided into four contracts, and modern mechanical appliances for excavation were introduced, and as a result much more rapid progress was made; and on 17th November 1869 the canal was duly opened by a procession of sixty-eight vessels, the leading vessel having the Empress Eugénie on board. The flotilla reached Suez on 20th November.

The total length of the canal is 100 miles; the width at the bottom at first was 72 feet, the width of the water surface varying from 150 to 300 feet; and the depth was 26 feet. The total cost was about £20,000,000, more than double the estimated cost for a larger canal as worked out by the International Technical Commission of 1856. At Port Said two strong breakwaters were run out into the Mediterranean to form an entrance-harbour; at Suez another substantial mole was built. The construction of this canal was much facilitated by the existence of three or four valleys or depressions (formerly lakes) which, when the water reached them, became lakes. Immediately south of Port Said the canal crosses Lake Menzaleh (28 miles long), and south of it the canal traverses three other lakes—Ballah, Timsah (5 miles long), and the Bitter Lakes (23 miles long). The highest point or elevation cut through was about 50 feet above sea-level. At first at intervals of 5 or 6 miles 'sidings' were provided to allow vessels to pass one another; but the rapid increase in the canal traffic made enlargements imperative, and by 1890 the canal had been deepened to 28 feet and widened between Port Said and the Bitter Lakes to 144 feet, and from these lakes to Port Suez to 213 feet; this permitted navigation by night in the case of vessels provided with search-light, and the average time of transit was reduced from thirty-six hours to about sixteen hours. The canal is now deep enough to admit vessels drawing 32 feet of water.

The subjoined table shows the enormous growth in the volume of tonnage using the canal since its opening in 1869:

Year.	Number of Vessels.	Gross Tonnage.
1870	486	654,915
1880	2026	4,344,519
1890	3389	9,749,129
1901	3699	15,163,233
1914	4802	19,419,495
1924	5122	25,109,882

Both in respect of tonnage and of the number of vessels, Great Britain greatly exceeds all other nations put together. In 1901 2075 of the vessels were British, their aggregate tonnage reaching 8,651,015 tons; in 1920 the British tonnage aggregated 61·7 per cent. of the total which passed through the canal.

In floating the company, besides 100,000 founders' shares 400,000 other shares, each of £20, were issued, making a total capital of £8,000,000. The khedive owned 176,602 of these shares, which were bought by Lord Beaconsfield in 1875 for the British government for £3,976,582, and have proved an extraordinarily valuable and profitable investment. Since the formation of the company, additional obligations up to £8,110,567 have been incurred. All net earnings that remain after 5 per cent. interest has been paid are divided in the following proportions: 71 per cent. to the shareholders, 15 per cent. to the khedive (now the king of Egypt), 10 per cent. to the holders of founders' shares, 2 per cent. to the managing directors, and 2 per cent. to the company's employees. There have been several reductions in the rates charged per registered tonnage of vessels using the canal, the present rate being 7·25 francs per ton and 4·75 francs per ton for ships in ballast, but the tariff per passenger remains at the original figure.

See De Lesseps, *Lettres, Journal, et Documents pour servir à l'Histoire du Canal de Suez* (5 vols. 1881); D. A. Cameron, *Egypt in the Nineteenth Century* (1898); the annual and other official returns of the company; Lord Milner, *England in Egypt* (6th ed. 1899).

Panamá Canal.—Two rival routes were proposed for the canal to connect the Atlantic and Pacific Oceans across the Central American Isthmus. At

Fig. 2.

about 160 feet—but the straight length across the isthmus is about 156 miles. About one-third of this length is covered by Lake Nicaragua, with ample depth, and connected to the Atlantic Ocean by a navigable river.

The completion of the Suez Canal gave a great impetus to the proposals for a Panamá or Nicaraguan canal. De Lesseps was in favour of the Panamá route. In 1878 Lieutenant Wyse obtained for a French association a concession from the Colombian government to construct a canal on the Panamá route. No work, however, was carried out by the holders of this concession. In 1879 an international congress was held at Paris, convened by De Lesseps, and immediately thereafter a French company was organised to purchase the Wyse concession for 10,000,000 francs. After several unsuccessful efforts, in 1888 a financial company was successfully floated, with a capital of 3,000,000,000 francs. This new company, after two years of preliminary survey work, decided on the adoption of a sea-level canal with a depth of 29½ feet. It was estimated that the total volume of excavation would be in the neighbourhood of 157,000,000 cubic feet, and that the cost would be somewhere in the neighbourhood of 658,000,000 francs. The total

length of the canal as projected was to be 47 miles, the route across the isthmus being that followed by the Panamá railway, and De Lesseps estimated that the canal could be constructed in about eight years. The French company carried on work until about the end of 1887, when it became obvious that the original sea-level canal was an impossibility with the funds available, and the scheme was changed to a canal with locks; but gross mismanagement led to the collapse and bankruptcy of the company early in 1889, and the liquidator eventually stopped all work on the canal in May 1889. Eventually in 1894 a new company was organised and floated, and was officially recognised by the Colombian government; but by this time the United States had become alarmed at the prospect of a canal across the isthmus controlled by European financiers and practically under the control of European governments. As far back as 1884 the United States government had taken up the Nicaraguan route as a rival scheme to the Panamá Canal, and in 1889 work was actually begun on this proposed Nicaraguan Canal, and continued until about 1893, when the company owning the concession became bankrupt, and the state of Nicaragua forfeited the concession. In 1899 the United States government appointed an Isthmian Canal Commission. This commission presented a report to Congress in 1900, in which it was stated that, as it seemed impossible to come to any agreement with the French new Panamá Canal Company, they, the commission, expressed the opinion that the United States government should adopt the Nicaraguan Canal scheme. The Panamá Canal Company, now recognising that it was impossible with the finances at their disposal to complete the Panamá Canal, agreed in January 1902 to sell their property and concession to the United States government for 40,000,000 dollars, and on 28th June 1902 a bill was approved by the President of the United States, authorising the purchase on condition that the Colombian government should grant perpetual control to the United States of a strip of land 6 miles wide along the route of the canal. A treaty was signed with Colombia in January 1903; but the Colombian Senate refused to ratify this treaty, and it seemed probable that the United States would be forced to take up the Nicaraguan route. However, in November 1903 the state of Panamá revolted from Colombia, and declared itself an independent republic. Almost at once it granted to the United States perpetual control of a strip of land 10 miles wide along the canal route, and the transference of the French company's rights and property was at once carried through.

Early in 1904 a commission was appointed to carry out the work, Mr J. F. Wallace being chief engineer. Early in 1905 the commission was reorganised, and Mr J. F. Stevens became chief engineer. The question as to whether the canal was to be a sea-level canal or a lock canal had never been definitely settled, and an International Board of Engineers was appointed to advise the United States government on this point. The board by a majority reported strongly in favour of a sea-level canal; the minority reported in favour of a canal which should have a summit-level about 85 feet above sea-level, and the necessary locks, and Mr Stevens, the chief engineer, supported this latter scheme. The report of the board was referred to the Isthmian Canal Commission, and this commission decided to recommend the report of the minority, and the commission's decision was ratified by Congress in June 1906.

Early in 1907 tenders were opened, but it was found that none of these was entirely satisfactory, and President Roosevelt decided that the work should be undertaken by the government, and

should be carried out under the control of the United States Corps of Engineers, Major G. W. Goethals being appointed engineer-in-chief and chairman to the Canal Commission.

The main dimensions of the canal are as follows: Length of canal from shore to shore, 40½ miles; or from deep water on the Atlantic side to deep water on the Pacific side, 50 miles. The summit-level, regulated between 82 and 87 feet above sea-level, extends for a length of 31½ miles from a dam at Gatún to one at Pedro Miguel; a flight of three locks gives access to it at Gatún, and two sets of locks lead from summit-level to the Pacific level at Miraflores. The Gatún dam, 6½ miles from the Colón end, created an artificial lake of about 164½ square miles in area, which forms the reservoir into which the flood-waters of the river Chagres—which had been such an insoluble problem in all the other schemes—pass. The locks are in duplicate, each 110 feet wide, with a maximum available length of 1000 feet; the maximum depth of water over the sill is 40 feet of salt water and 41½ of fresh water.

The mean sea-level is the same at Panamá and Colón, but the rise and fall of tide at Colón is only 2½ feet, and at Panamá 21 feet.

Beginning at Colón, the first 6½ miles of the canal are a channel 500 feet wide and 41 feet deep, mostly dredged out. Then the locks in the Gatún dam give access to the artificial lake. This lake forms the summit-level, which extends from mileage 6½ at the Gatún lock to mileage 39 at the Pedro Miguel lock. The width of the channel for about 16 miles is 1000 feet; thereafter it is gradually decreased, till in the famous Culebra cut, which carries the canal through the continental divide, the width becomes only 300 feet. The minimum depth is 41 feet.

The Pedro Miguel lock is a single lock, by which ships are lowered from the 85 feet level of the Gatún lock to the 55 feet level of the Miraflores Lake. On each side of this lock are dams extending to the adjoining hillsides, in order to prevent the impounded waters of Gatún Lake flowing off towards the Pacific.

From mileage 39 to mileage 41 the canal is formed by another artificial lake, Miraflores, formed by impounding the waters of three rivers which drain into the Pacific.

At Miraflores there are two twin locks, with dams on each side to form the Lake Miraflores. The double locks have a total drop of 54½ feet. The channel through Miraflores Lake is 500 feet wide, and from the Pacific side of the locks the channel is maintained at a uniform width of 500 feet.

All curves are of as large a radius as possible, and the channel is widened at all curves so as to allow vessels to take the curve easily and to render unnecessary any checking of speed; in fact, a ship can steam the whole 50 miles at full speed with the exception of the 9 miles which comprise the Culebra cut.

The total excavation was estimated to be about 182,000,000 cubic yards. The total earthwork excavated under the French scheme was about 78,000,000, of which rather less than half was adapted to the present scheme.

Owing to the constant slips in the Culebra cut and silting brought about by the Chagres River the total excavation probably exceeded 200,000,000 cubic yards. Neglecting any effect of side-slips, the Culebra cutting would have required about 90,000,000 cubic yards of excavation. These figures will give some idea of the magnitude of this particular portion of the work. The slipping occurred in two ways—the soft material slipped forward on the inclined surface of the harder material below,

or the soft matter underneath was squeezed up by the weight of the sides.

Of the five dams directly connected with the canal the Gatún is by far the most important, and presented the greatest difficulties in construction. Its length is 7500 feet, its greatest height 115 feet above sea-level, the greatest width at the bottom 2100 feet, and the width at the top 100 feet, the cubical contents of the dam being 21,000,000 cubic yards.

The maximum flood discharge of the Chagres River at a point near to the 30½-mile peg on the canal was 170,000 cubic feet per second, which caused the river to rise 40 feet in level in twenty-four hours.

The dam is made in three parts—two outside portions, and an inner core of material of a silty character, pumped up from the bed of the river, called 'the hydraulic fill.' The outside portions were tipped from the rock, and other material brought from the Culebra cut.

The spill-way in connection with the dam was arranged to have a discharge capacity of 154,000,000 cubic feet per second, and it leads into the old bed of the Chagres River below the dam. The depth of water in the lake is 47 feet, which is 5 feet more than is absolutely required. The power required to work the sluice-gates in connection with the spill-way and all the lock machinery is generated at the spill-way by turbines.

The labour force at its maximum amounted to 35,000—5000 skilled labourers and artisans from the United States, 4500 Spaniards and Italians, and about 25,000 West Indians—the United States government providing practically the whole of the food and clothing of this great force of labour.

The sanitary arrangements were carried out on a marvellous scale, over two years being spent on the sanitary work, drainage, and preparation of quarters, and strict quarantine was enforced. All quarters and offices belonging to the Canal Commission were protected by copper gauze wire-netting. All rain-water was drained off, and all stagnant pools practically closed. Wherever possible swamps were filled up, and all drains were kept clear of weeds by being sprayed regularly with weed-killing disinfectant, and all pools which could not be drained were sprayed with kerosene at regular intervals. The wire-netting on the houses added greatly to the comfort of the occupants.

The canal was completed and unofficially opened on 15th August 1914. The first vessel to make the trip was the United States War Department steamer *Ancon*, on board of which was a number of officials and guests, including the President of the Republic of Panamá.

See a paper by Colonel G. W. Goethals, read before the British Association at Winnipeg in 1909, published in *Engineering*, vol. lxxxix. p. 171. A complete account of the canal has been published in a series of articles in *Engineering*, vols. xcvi.—xcviii.

Isthmus of Corinth Canal.—Work in connection with the provision of a ship-canal across this isthmus was begun by the Emperor Nero; traces of this work still remain. The present canal was begun in 1882. It is 4 miles long; the central portion cut through rock is a cutting 285 feet in depth; the section at this point is shown in figure. The canal has no locks, the bottom width is 72 feet, and the depth 26½ feet, the original dimensions of the Suez Canal. At each end the approaches are protected by solid jetties built out into the sea. This canal, which shortens considerably the distance between certain of the Mediterranean ports and the Black

Fig. 3.

Sea, was completed in 1893, and cost between one and two millions sterling.

Kiel Canal.—The original Holstein Canal, about 26 miles in length, opened in 1785, connected the river Eider, which flows into the North Sea, with Kiel on the Baltic shores, and enabled vessels of 120 tons to pass direct to the Baltic from the North Sea, thus avoiding the circuitous and difficult voyage round Jutland; it was only 51½ feet wide and 9½ feet deep. In 1887 works were begun for a real ship-canal from Brunsbüttel, at the mouth of the Elbe, to Holtenau and Kiel, capable of allowing the passage of the largest sea-going steamers. It was to be 28 feet deep, 198 feet wide at the surface, and 72 feet wide at the bottom. It was partly opened in 1891, and completed in 1895. At the Kiel end there is a big lock. The estimated cost was £8,000,000. As the sea-voyage from the Elbe round Jutland was about 600 miles in length, and was, in addition, a piece of dangerous navigation, the commercial and naval importance of this canal to Germany was immense. The rapid increase in the size of modern battleships compelled Germany, if it was to derive full strategic value from this canal, to begin in 1908 the work of greatly enlarging its cross-sectional dimensions; the depth was increased to 36 feet, and the bottom width to 144 feet. The work was not completed when war broke out in 1914, but was finished during the early years of the war, the total cost being about £11,000,000, and the canal played a very important part in German naval strategy during the great naval struggle between 1914 and 1918.

Amsterdam Ship-canal.—This canal, which connects Amsterdam with the North Sea, thus severing the peninsula of North Holland, provided a more direct outlet for the trade of Amsterdam to the ocean than was possible by the shallow Zuider Zee and the North Holland Canal. The canal passes through Lake Y and Wyker Meer, and therefore

Fig. 4.

only a narrow neck of dry land, 3 miles in width, between Velsen and the North Sea, had to be excavated. Part of the cost of the work was met by reclamation of land in the two lakes, made possible by the banks formed by the material dredged up in the excavation of the canal proper through the lakes (see fig. 4). The canal is 16½ miles long, is wider (see fig. 5) at the base, and

Fig. 5.

only 3 feet shallower, than the original Suez Canal section. Locks near each end of the canal, with gates pointing both ways, afford perfect control over the water-level of the canal, which is maintained at 14 inches above low-water level in the North Sea, in order to maintain the drainage of the low-lying adjacent lands and the reclaimed lake areas. Drainage water, which passes into the canal from branch canals, and is pumped into it

from the reclaimed land, is pumped up from the canal into the Zuider Zee by pumping plant placed near the locks in the dam which shuts off this Zee from the canal and reclaimed lands. The North Sea entrance is protected by two converging concrete breakwaters. The work was begun in 1865, and completed in 1876 at a cost of about £2,600,000.

Manchester Ship-canal.—This canal, which was at the first inception of the scheme violently opposed by Liverpool and the railway interests, was sanctioned by parliament in 1885. The canal begins in deep water at Eastham, on the left bank of the Mersey, opposite to Gaoston; it then skirts the shore of the Mersey estuary up to Runcorn, where it cuts into the land, and, following approximately the course of the Irwell, finishes in Manchester at Trafford Bridge. At its terminus, docks with a water-surface of 105 acres have been provided. The canal is 35½ miles long, the minimum depth is 26 feet, and the minimum bottom width is 120 feet (see fig. 6); in good ground the side-slopes are 1 to 1, well pitched with stones. At Eastham are tidal locks, with their sills 20 feet below low-water, so

Fig. 6.

that vessels are able to enter and leave the canal at about half-tide; the lift of these locks is 16½ feet. The canal is divided by locks into four reaches of lengths 21, 7½, 2½, and 3 miles respectively, the locks being situated at Latchford, Irlam, and Barton, with lifts of 16½ feet, 14 feet, and 14 feet respectively. There are three sets of locks at each of these places, 550 feet long by 60 feet wide, 300 feet by 40 feet, and 100 feet by 20 feet, the two larger locks having intermediate gates. This plan enables a great variety of vessels to be dealt with, and economises losses of water by lockage. The passage of the canal takes about seven hours, allowing about twenty-five minutes for passing each lock. The famous Bridgewater Canal crosses the canal by a swing aqueduct, so as to allow masted vessels to pass along the ship-canal, and a hydraulic lift affords communication between the two waterways. The total cost of the canal was about £15,500,000, and the traffic

along it has grown steadily year by year since its completion.

Other interesting ship-canals for converting inland towns into seaports are the Bruges Canal to Zeebrugge; the Ghent-Terneuzen Canal—this latter connecting Ghent by a route only 21 miles long with Terneuzen, on the Scheldt; and the Petrograd and Cronstadt Canal, made necessary by the bar at the mouth of the Neva and the want of depth in the Gulf of Finland. This canal starts from the Neva in Petrograd. It is 22 feet deep, and has at the start a bottom width of 207 feet, gradually enlarged to 275 feet. It cost about 1½ millions sterling.

Numerous other important ship-canals in various parts of the world have been proposed, but so far none of these have been pushed beyond the proposal stage, such, for example, as the Forth and Clyde Canal.

The question of the sanitary condition of canal-boats, their registration, &c., are dealt with in the Canal Acts of 1877 and 1884.

Canandaigua, the capital of Ontario county, New York, at the north end of Lake Canandaigua, 28 miles SE. of Rochester by rail; pop. 7000.

Canara. See KANARA.

Canarium, an oriental genus of *Buiseraceæ*, yielding gums, oils, &c. *C. commune* is a native of the Moluccas, but introduced into many parts of tropical Asia. It is a tree about 50 feet high; its fruit is a drupe, of which the kernel is eaten raw, roasted, or made into bread. The tree also yields a resin. *C. strictum* yields black dammar (see DAMMAR). Elemi (q.v.) and Pili nuts (rich in fat and used for dessert and confectionery purposes) are got from the Philippine tree, *C. luzonicum*, and other species.

Canary Bird (*Serinus Canaria*), one of the finch family (Fringillidæ), akin to the goldfinches and the linnets. It is found in Madeira, the Canary and Cape Verde Isles; frequents the neighbourhood of human habitations; builds its nest of moss, feathers, hair, &c. in thick, bushy, high shrubs or trees; and produces from two to four broods in a season. In its wild state its plumage is olive-green or greenish-yellow tinged with brown, and the yellow cage-birds have been produced by selective breeding in domestication. It was brought to Europe in the beginning of the 16th century. It breeds readily in confinement, seems thoroughly reconciled to its cage-life, and if handled when young becomes very tame and fearless. In confinement the canary often breeds three or four times a year, laying from four to six eggs each time. The eggs are pale blue. The male assists the female in building the nest and in feeding the young. Besides canary and millet seed, which are their principal food, canaries are very fond of flowering groundsel and chickweed, a very small supply of which is necessary for their health; and one of their favourite luxuries is sugar. The canary not infrequently lives 15 or 16 years. It can be taught various notes and airs, and even learn to articulate words. The rearing and training

Norwich Canary.

of canaries afford occupation to no small number of persons, particularly in Tyrol. The canary hybridises readily with some other species of finch, producing 'mules,' some kinds of which are valued as song-birds. There are several species very closely allied to the canary, one of which, the Saffron Finch, a beautiful little bird, a native of Brazil, is sometimes sold in Britain as a song-bird, but its musical powers are very inferior to the canary's.

Distinct varieties have been produced by scientific selective breeding, and these reproduce their distinctive characteristics, and 'like breeds like' so long as the varieties are not crossed. The hardest

are the Norwich; the largest are Lancashire Copies; the most costly and delicate are Belgians; others are Lizards, London Fancies, Yorkshires, Scotch Fancies, and Cinnamons. By giving sponge-cake and cayenne pepper mixed, instead of seed, at the period of moult the plumage is artificially coloured, becoming very brilliant; and canaries apparently relish this fiery diet and thrive upon it. See CAGE-BIRDS.

Canary Creeper. See TROPÆOLUM.

Canary Grass (*Phalaris canariensis*), a grass of which the seed is much used, under the name of *canary-seed*, as food for cage-birds, and which is on that account largely grown in southern California, and to some extent in the south of Europe, and in certain districts of Germany and England. It has become naturalised in many parts of northern Europe, including Britain, but is a native of southern Europe and the Canaries, where it sometimes furnishes a wholesome and palatable addition to or substitute for wheaten flour. The large Reed Canary Grass (*P. arundinacea*), common on river-banks, is an abundant source of coarse fodder. A striped variegated variety is

Canary Grass (*Phalaris canariensis*).

cultivated as 'gardeners' garters,' 'ribbon grass,' or 'ladies' traces.'

Canary Islands, a group of islands belonging to Spain in the Atlantic Ocean, off the NW. coast of Africa, in 27° 40'–29° 25' N. lat., and 13° 25'–18° 16' W. long., forming a Spanish province. The group consists of seven large and several small islands, with a joint area of about 2800 sq. m., and a population of 473,500. The principal islands, proceeding from east to west, are Lanzarote, Fuerteventura, Gran Canaria, Tenerife, Gomera, Palma, and Hierro or Ferro. The distance from Fuerteventura to the African coast is about 62½ geographical miles. The coasts are steep and rocky, and the surface is diversified with high mountains, narrow gorges, and deep valleys. All the islands are volcanic, and everywhere show plain marks of their origin, in the shape of cones, craters, beds of tuff and pumice, and streams of lava; but eruptions have taken place within the historical period only in Tenerife, Palma, and Lanzarote. There are no rivers, and on several of the islands water is very scarce. The springs on those better supplied are diverted by long artificial channels for the purpose of irrigation.

Of a thousand species of wild flowering plants found on these islands about half are peculiar to the

group. Above the region of cultivated plants in Tenerife and Grand Canary are found laurels and other evergreen trees. Higher still are forests of the handsome *Pinus canariensis*, and large tracts are covered with arborescent heaths and brooms of many species. Looking at the flora as a whole, it is seen to be mainly of a South European character, with a large infusion of genera allied to African types. As to the cultivated plants, the warmth of the lowest region allows of the growth of the sugar-cane, sweet potato, banana, date-palm, and other natives of hot climates; whilst above, to the height of about 3000 feet, the vine and various cereals are cultivated in a climate resembling that of the south of Europe.

Minerals are few and of little importance. The temperature near the sea is genial. Taking Puerto Orotava, on the north coast of Tenerife, as an example, the annual mean is about 69·5° F.; the mean of January and February, the two coldest months, is 62·25°; the mean of August, the hottest month, is 77·2°; the daily range during the colder months is from 10° to 17°. The mean annual fall of rain amounts to about 14 inches, and the mean number of days on which rain falls during the year is 52. Rain falls irregularly on the coast from November to April; for the rest of the year the cultivators of the soil rely upon artificial irrigation. The north-east trade-winds prevail from April to October; at other times south-west winds are prevalent. Occasionally the islands are visited by hot east and south-east winds from Africa, which bring dust and are otherwise disagreeable. In consequence of the higher temperature, the less rainfall, and drier atmosphere compared with Madeira, and of the much increased facilities for reaching the islands, Orotava and Las Palmas have come into note as winter-resorts for invalids.

Cochineal, once the staple production, has fallen into neglect, owing to the competition of aniline dyes. The cultivation of the vine (almost ruined after 1853 by the grape disease—see VINE) has extended, as has that of sugar-cane; wine being exported to the European continent, and sugar to Spain. Tobacco is also grown. Excellent roads have been formed; the ports of Santa Cruz and Las Palmas have been improved.

TENERIFE, the largest island of the group, has an area of 877 miles, with a population of 184,000. The chief town and port is Santa Cruz de Santiago (q.v.), on the south-east coast. It is the seat of the officials of the general government. The other towns are Laguna, a few miles from Santa Cruz, on a plain 1800 feet above the sea; Puerto Orotava, on the north coast; Villa Orotava, 1060 feet higher; and Icod de los Vinos, near which the largest existing dragon-tree grows. The famous Peak of Tenerife (q.v.) is in the south-west of the island.

GRAN CANARIA, which is next in importance, has an area of 758 sq. m., with a population of 164,000. Its culminating peak is El Cumbre, with a height of 6648 feet. The capital, Las Palmas (q.v.), on the east coast, is the largest town of the archipelago. The surface of this island is so broken that only a small part is under cultivation. At Artinara, at a height of 3350 feet, there is a village of caves. A few miles from Las Palmas is the cone of Vandama, 1800 feet high, with an extinct crater, circular and perfect, 800 feet deep.

PALMA, a classic spot for geologists, has an area of 718 sq. m., and a population of 50,000. Its highest peak, Pico de los Muchachos, has an elevation of more than 7600 feet. The ancient crater of the Caldera is of enormous size, though open to the sea on one side. The capital is Santa Cruz de las Palmas (q.v.), on the east coast.

The area and population of the other islands are as follows: LANZAROTE is 323 sq. m., pop. 21,000;

FUERTEVENTURA, 326 sq. m., pop. 13,000; GOMERA, 169 sq. m., pop. 15,000; HIERRO, 82 sq. m., pop. 6500. In former times the first meridian of longitude was commonly drawn through Hierro. The chief towns of these islands are small.

The Canaries are by some supposed to have been the Fortunate Islands of the ancients. The geographers of Greece and Rome were acquainted with their position, and King Juba's account of them has been preserved by the elder Pliny. For many centuries they were lost sight of, and not rediscovered until 1334, when a French vessel was driven amongst them by a storm. In 1402 the Norman Jean de Bethencourt fitted out an expedition for the purpose of subduing the islands, and in 1404, having obtained assistance from Spain, he succeeded in mastering four of them. His successor having sold his rights in Spain, they were afterwards acquired by the king, who sent a large force in 1477 to conquer the Guanches, a race of large stature, and comparatively fair, at that time in a neolithic stage of civilisation. The last of the islands was not mastered till 1495. They have been ever since the property of Spain. The Guanches suffered terribly from their conquerors, and have long ceased to exist as a separate people; but in the local museums may be seen specimens of their mummies, skeletons, weapons, and pottery works. They were a composite people, made up of three or more stocks: a Cro-Magnon type, a Hamitic or Berber type, and a brachycephalic type.

See books by Pegot-Ogier (Eng. trans. 1882); Olivia Stone (1888); C. Edwards (1889); J. Whitford (1890); J. H. T. Ellerbeck (1892); A. S. Brown (1901); Alonso de Espinosa, *The Guanches of Tenerife* (trans. Markham, Hakluyt Soc., 1907); D. A. Bannerman, *The Canary Islands, their History, Natural History, and Scenery* (1922).

Canary Plant. See TROPÆOLUM.

Canary Wine, also known as TENERIFE, is the produce of the Canary Islands, and is a dry white wine resembling Madeira, but with less body and perfume. The name *Canary* was formerly applied generally to dry white wines, which were frequently seasoned with sugar, cinnamon, nutmeg, roasted apples, and eggs.

Canberra, destined Federal capital of the Commonwealth of Australia, was till 1910 an unimportant hamlet 226 miles south-west of Sydney by rail and road. The site was fixed by act of parliament in 1908 as in the 'Yass-Canberra' district, and was later on defined as an area of about 12 sq. m. near Queanbeyan, in the northern part of the Federal Territory—an area of 900 sq. m. along the Upper Murrumbidgee, to which has been added a patch of coast-land 120 miles away, stretching from the southern shores of Jervis Bay to St George's Basin. The Federal Military College is situated in the Territory proper, and the Naval College is in the coastal annex. The foundation of the 'commencement column' in front of the Capitol, on the highest eminence of the site, was laid with suitable ceremony on 12th March 1913. Pop. of Federal Territory, 2600.

Cancale, a bathing-place in the French department of Ille-et-Vilaine, 8 miles ENE. of St Malo, on the bay of the same name, famous for its oysters; pop., with the port of La Houle, 7000.

Cancan is an ungraceful dance, something of the nature of a quadrille, but accompanied by violent leaps and indecorous contortions of the body, practised in French dancing-saloons. The earlier and usual meaning of the word is noise, racket, scandal.

Cancellaria, or LATTICE-SHELL, a large genus of Gasteropods in the order Prosobranchiata, not far removed from the cone-shells. The shell is usually buckie or whelk-like, but the transverse

lines are crossed by longitudinal bars, which produce a pretty lattice-like pattern.

Cancelling of Deeds and Wills. The word cancel comes from the Lat. *cancelli* ('lattice-work'), and a deed was formerly said to be cancelled when lines were drawn over it in the form of lattice-work. The word cancel is now used to signify any act of obliteration, destruction, or revocation showing a deliberate intention on the part of the grantor of a document to render the document inoperative, in whole or in part. Thus a will may be cancelled by the testator executing another will or codicil inconsistent with, or expressly revoking, the former; or by the original will being burned or torn up or otherwise destroyed by the testator, or by some one in his presence and acting on his directions, with the intention on the part of the testator that it should be revoked. The destruction or mutilation of a will by some accident, or by the testator while insane, or by any person acting without the authority of the testator will not operate cancellation. But when a will has been executed in duplicate, the destruction or tearing up of one of the parts by the testator is effectual if proved to have been done by him with the intention of revoking the will. Obliterations, interlineations, or other alterations in a will are not effectual to cancel or alter the testamentary dispositions, however clear the intention may be to do so, unless they are properly identified by the signature of the testator and two witnesses; even if the testator draws his pen through his own signature and those of the attesting witnesses, this is not a cancellation of the will. Where, however, the obliteration is such as to prevent the words originally written from being 'apparent'—i.e. such as that they cannot be read—the words so obliterated are cancelled. So if the signature is cut out or completely obliterated the will is cancelled. A material alteration, or erasure of words, in a deed or any contract in writing, if made intentionally by one of the parties thereto, without the consent of the other, prevents the former enforcing the deed or contract against the latter. In the absence of evidence, alterations in deeds are presumed to have been made *before* execution, and those in wills *after* execution. In a Scottish deed or will, probative in form and not holograph, cancellations by way of deletion or erasure must, in order to receive effect, as a rule be enumerated in the testing clause or otherwise be properly authenticated. In a bill of exchange an erasure or other alteration that is 'not apparent' does not render the bill void in the hands of a holder in due course. He can enforce the bill as originally written (Bills of Exchange Act, section 64). But it has been held that this provision does not apply to Bank of England notes.

Cancer, the *Crab*, the fourth of the twelve constellations and signs of the zodiac. See ZODIAC; also ECLIPTIC, PRECESSION; and for the TROPIC OF CANCER, see TROPICS.

Cancer (Lat. *cancer*, 'a crab'; Gr. *karkinos*). The reason for the application of this term to the most important group of the tumours is shrouded in mediæval obscurity. It has been supposed that it was employed because of some fancied resemblance of the tumour to the body and limbs of a crab, when from the central tumour dilated veins extend into the surrounding tissues, and it has been suggested that the gradual eating away of tissue by ulceration gave rise to this curious name. Since a crab has a hard shell, it owes its Greek and Latin names to this fact; and the term cancer, as applied to disease, may have originally meant nothing more than a hard lump on the surface of the body, for internal cancer was hardly known before post-mortem examinations began to be per-

formed towards the middle of the 19th century. The term is now in general use as covering all sorts of 'malignant new growths' or 'tumours', as distinct from other tumours of an innocent, inflammatory, or hypertrophic nature. Cancer is limited scientifically to the 'carcinomata', which are malignant new growths of epithelial origin—i.e. arising on the surface of the body, in the lining of the alimentary canal, and in the lining of glands generally. Such growths arising in covering or secreting epithelium are distinguished from the 'sarcomata', which arise in the supporting connective tissues, the bones, in cartilage, and in lymphatic glands.

Distribution.—While it was formerly supposed that cancer was a disease of civilised man only, the investigations of the Imperial Cancer Research Fund have shown that no race of mankind is exempt. It is very common in Japan and in India. Strictly vegetarian and other castes are equally liable. It occurs throughout the aboriginal inhabitants of Africa. There are no data which permit of reliable comparisons between each European country and another, and there is no means whatever of determining the relative liability of aboriginal races, since all data of population and of the relative proportions of the two sexes at the several age-periods are wanting. The investigations of the Imperial Cancer Research Fund have also shown that all vertebrates are liable to cancer even when living in a state of nature. The disease presents the same essential features throughout the vertebrates if regard be paid to differences in anatomical structure.

Relation to Age and Sex.—Cancer has a remarkable relation to age. Below thirty-five it is a rare disease, but it becomes a very important cause of death in the meridian and post-meridian periods of life, the liability increasing as age advances. The age at which the several organs are most liable varies from one to another, but is the same for the same organs in the two sexes. This relation to age also holds for all vertebrate animals whether life be long or short; it appears to be bound up with the origin of the disease. Women are more liable to cancer than men, but this is solely because of the frequency of cancer of the womb and breasts, organs which can be left out of account in the male sex. If the figures for these organs are deducted for females, then males show a higher rate.

Relative Frequency in Different Parts of the Body.—Cancer of the stomach and of the liver (the latter is probably secondary to cancer elsewhere—e.g. of the stomach, intestines, rectum, pancreas) causes most deaths at each age-period after thirty-five. Cancer of the rectum takes third place except at the latest age-period, when cancer of the face (largely rodent ulcer) causes more deaths. Amongst women the uterus is the commonest site of the disease up to sixty-five, the stomach from sixty-five to seventy-five, and the breast after seventy-five. The breast comes second up to sixty-five, but only fourth from sixty-five to seventy-five. Apart from the reproductive system, the stomach and liver come first as in man. For the alimentary canal the figures of relative liability of the two sexes cross at the stomach, so that in males there is more cancer above the stomach, and in females more below it. This peculiarity has been brought into relation with the habits of the two sexes whereby the male irritates the upper half of the canal by smoking, drinking, and excesses in eating, and the female suffers more from the chronic irritation associated with constipation.

Apparent Increase.—The real or apparent increase of cancer has long been the subject of discussion. When all cases of cancer are thrown together, there is a remarkable increase in the total number

of cases recorded during the past sixty years in all countries where any statistics are available. The increase is also evident when the figures are stated in terms of a million persons or of each sex living at each age-period. The increase affects mainly the higher age-periods and the parts of the body less easily accessible to complete examination. These facts have suggested that more careful certification of the causes of death and improvements in diagnosis are largely responsible for the apparent increase. An apparent increase is also observable for the tongue and breast, which can hardly be fully accounted for in this way. Little or no increase has been recorded for the liver, ovary, uterus, skin. The greatest increase has affected the stomach and intestines, obviously because deaths formerly attributed to cancer of the liver are now allocated to the correct site of origin with greater frequency. The question of the real or apparent increase of cancer is a complex statistical problem of which the solution is by no means finally settled. It seems, however, certain that it is wrong to speak of an increase of cancer as a whole; the increase, be it real or only apparent, affects different parts of the body unequally, and for some parts it has not taken place at all.

Nature.—Cancer manifests itself by the appearance of a lump, and later an ulcer due to a continuous new growth of cells. The change begins in a limited area, and in the natural course of the disease the growing cells spread throughout the body until death ensues. The nature of the change in the cell growth from healthy to cancerous is still unknown, although certain conditions—e.g. aging and chronic irritation of the tissues—are in some way associated with its origin. It is, however, definitely established that the cancerous change is at first purely local; but if the disease be allowed to run its normal course, the offspring of the original cancer cells spread throughout the body.

The exact knowledge of to-day has rejected the old surmise that cancer pervaded the system as a whole before it broke out at any particular spot. Cancer is not an outgrowth or outcrop from deep-seated 'roots,' but consists of a circumscribed mass of cells of epithelial origin from which offshoots may ultimately spread throughout the body. A carcinoma may begin in a little group of cells in the skin, the mucous membrane of the stomach or intestine, in the breast—in short, in any gland or on any surface covered by epithelium. A sarcoma arises in the same way in any of the connective tissues, fat, bone, bone-marrow, periosteum, lymph glands. Cells which have undergone the cancerous change cease to serve any useful purpose in the body. They multiply not to replace others that have been used up, but wantonly or purposelessly, and often with astonishing rapidity. They become dangerous to the body as a whole by invading the surrounding tissues, which they grow into, or before doing so push aside. Thus, according to their situation, they destroy bone, cartilage, the eyes, the ears; they press upon the windpipe or gullet, causing difficulty in breathing or actual starvation; they destroy the walls of blood-vessels and lead to exhausting bleedings. Important glands like the liver, pancreas, or thyroid may have their functions gravely disturbed. Digestion in the stomach and intestines may be seriously interfered with. These are all the consequences of the action of the growing cancer cells on their immediate surroundings; but there are also remote consequences owing to cells being freed from the mother tumour, and after being transported by the blood or lymph streams, establishing themselves in distant parts of the body, there to repeat their pernicious local consequences—in the lungs, the liver, the bones, the brain, the

lymph glands, &c. These secondary colonies or metastases reproduce more or less perfectly the structure of the original growth, so that under the microscope a piece of rectum appears to be growing in the liver, or a piece of liver growing in the lung. The earlier and the more numerous such secondary growths develop the sooner comes the end, which may or may not be preceded by marked wasting or 'cachexia.' Although there are differences of opinion regarding the nature of cancerous cachexia, the weight of evidence favours the view that it is a consequence of the advance of the disease and not an antecedent constitutional condition. Cachexia is most marked where there is interference with the food-supply through difficulty of swallowing, obstruction or ulceration of the intestinal canal. Where large ulcerating surfaces develop either on the surface of the body or in the alimentary canal, the plight of the patient is rendered worse by the absorption of septic products. Fortunately the course of events is not uniformly so bad. The end may come long before the final stages of wasting would lead to death from exhaustion. A sudden hæmorrhage due to the erosion of a large blood-vessel or an embolus carried to the brain, the heart, or lungs may bring about a sudden and painless end even in the worst cases. Moreover, cancers are not all equally malignant in their course. There are slowly growing and rapidly growing forms. From the time of first observation life may last for a few months or for many years, and in the latter case often with little more than discomfort. Practically any tissue of the body (except the nerve cells of the brain) may give rise to cancer, and under the microscope the tissue of origin is mimicked more or less closely. The more closely this structure is reproduced the less dangerous as a rule is the cancer. There are all stages in structure: at the one end what are known as soft cancers have lost all structure, and as a rule they grow very rapidly; at the other end there are all stages of retention of structure up to tumours which show little or no departure from the normal. Such are usually called benign or innocent growths, but no sharp line can be drawn between the benign and the malignant tumours under the microscope. There are many anomalies. Some cancers produce a large amount of connective tissue reaction. They are then very hard, as in the well-known and frequent 'scirrhous' of the breast, which notwithstanding its hardness is one of the worst forms of the disease. Tumours of the thyroid gland may show no departure from the normal structure, yet disseminate widely, especially in the bones, particularly those of the skull. An apparently innocent tumour may grow slowly and without danger for years, and then for some unknown reason suddenly begin to grow rapidly and fatally. The most dangerous forms of cancer occur when a rapidly growing tumour develops in a young, robust individual. As a general rule cancer, which is more frequent in the higher age-periods, is less dangerous than in more youthful individuals.

Cause.—The cause of cancer is unknown. For a time it was supposed to be a parasitic or infective disease. No evidence able to withstand scientific criticism has been advanced during the thirty years that this view has been put forward by reputable and even distinguished authorities, but it is only certain that cancer has no analogy with any known form of infective disease. Age, by bringing with it senescence of the tissues, is in some way bound up with causation, but how is unknown. Heredity has long been supposed to have some importance in man, and breeding experiments with mice have shown that there is some justification for this view, although not to an extent to create alarm, since the very high concentration of the hereditary factor, experimentally possible in mice, is not likely to occur,

often, if at all, in a human population. Chronic irritation is apparently of great moment, especially for some parts of the body. The investigations of the Imperial Cancer Research Fund have raised to the level of unintentional experiments on the production of cancer certain peculiar practices of native races who are especially liable to cancer of certain parts of the body from which the disease is absent in other races. Similar accidental experiments have been made on animals, and there are indications that cancer may even be deliberately induced in them by irritation experimentally applied. These observations have directed renewed attention to the association of cancer with all forms of chronic irritation, which may be mechanical, actinic, chemical, or animate, as the tubercle bacillus in an old lupus scar, bilharzia in the cancer of the bladder so common in Egypt, &c. The irritants have nothing in common, so that the search has been directed to the properties of the cancer cell itself. The great variability of these cells under experimental conditions has recently attracted attention, and is being widely studied with a view to explaining the association of cancer with chronic irritation.

Diagnosis.—The signs attending the early development of cancer are so insignificant that they do not attract the attention of the patient himself, and are often not observed even by the skilled practitioner. The first symptom to attract attention may be ulceration or pain where an antecedent lump had attracted no notice. It may be that intractable indigestion has been neglected till loss of flesh and an unhealthy appearance urge the patient to seek medical advice. In other cases, notably when the uterus is involved, repeated or irregular bleeding may be the first sign to awaken alarm.

Added to the difficulty arising from the insidious onset of the disease is the further one that cancer has no specific symptomatology. The signs or symptoms attending the early development of cancer are very variable even for the same part of the body. If it be on the surface of the body, an abnormality is more likely to attract early attention than if an internal organ be affected. A small ulcer or lump on the surface of the tongue will soon attract attention from the pain and inconvenience it immediately causes, but such conditions in the stomach will remain unnoted till a secondary disturbance of function calls for a careful examination. Pain is very emphatically associated with some forms of cancer affecting particular parts, but it cannot be too strongly urged that cancer in its beginnings is always painless, and it may long run its course, and even terminate fatally, without any pain whatsoever. Pain, therefore, should never be waited for; and since a lump or ulcer is the most obvious sign of a cancer, a warning must be entered against assuming all lumps and ulcers to be cancer. The great majority will be found to be nothing of the kind, but only the skilled adviser can advise as to whether mere inflammation, hypertrophy, a harmless cyst, or a benign tumour is present. The examination of all conditions simulating cancer outwardly, or actually cancerous, can only be conducted by members of the medical profession possessed of the highest anatomical and physiological knowledge, as well as of wide experience and skill, since it is necessarily by a process of exclusion that the diagnosis is arrived at. Such knowledge of the natural structure, and of the departures from it, combined with knowledge also of the natural function and morbid processes occurring in the sites liable to cancer, is commonly and most likely to be found in surgeons of eminence, and in well-educated physicians whose skill and personal characters place them above suspicion. Delay in seeking such advice through fear of learning the truth may result in the disease advancing beyond all remedy.

Morbid fears of cancer may be at once dispelled by the skilled medical attendant, who is able to weigh up and sift the very complex elements which enter into the process of diagnosing what is the nature of the tumour which has attracted the patient's notice.

Having regard to the fact that cancer is not preceded by any definite warning signs, and also to the knowledge that it develops in a circumscribed area, diagnosis must depend upon an examination of that area. Naturally, if the lump or ulcer is on the surface of the body examination is easier than when it is internal, but diagnosis is uncertain without the removal of the growth for microscopical examination by a skilled pathologist, who should have all the information elicited by the surgeon placed at his disposal. An exploratory operation may be performed in order to ascertain the nature of an internal growth before its removal is decided on. A small piece of growth may be cut out in order to determine whether or not a more extensive operation should be performed, and then precautions are taken against the risk of spreading the disease by sowing the cancer cells in the wound, and against the chance that a piece removed haphazard may give no true idea of the structure of other parts. A skilled diagnostician will not recommend an operation at all unless he is convinced that it is in the best interests of the patient.

Treatment.—The earliest possible diagnosis of the disease is essential to its successful surgical removal, for it is only in the early stages of the disease that there is any hope of a cure, and unfortunately the majority of patients seek surgical aid when these stages have passed. Recurrence then is frequent. Even if the lymphatic glands are involved by dissemination, great relief may be obtained, although the hope of cure is greatly diminished. If dissemination has extended to the internal organs—e.g. the lungs and liver—nothing can be done to remove the harm in these regions, and surgical treatment of the original growth has for its sole objects the diminution of suffering and offensive discharge.

The only known cure for cancer is the complete removal of the diseased area by means of the knife before the growth has had an opportunity of spreading throughout the body, and the smaller the growth is and the earlier the case is operated on, the earlier and more certain of success the operation becomes. Early operation is more readily possible in cases of cancer on the surface of the body.

Some very small and superficial growths of the skin may be cured by destruction with caustics such as arsenical or zinc paste, strong acids, X-rays, or radium; but these measures cannot be applied to internal growths or employed with success where a superficial growth has attained large proportions. The surgical treatment of cancer is of ancient origin, but as practised to-day it must not be confounded with the crude methods of the past. Anæsthetics and antiseptics have revolutionised surgery, and have enabled the surgeon to look for and to remove cancer in all organs of the body, not even excepting the brain and spinal cord. Naturally, the more obscure its situation the later is the discovery of the disease. Cure in the case of cancer of the brain and spinal cord is relatively rare, but for skin cancer 80-90 per cent. of cures are obtained. In cancer of the breast there are 40 per cent. of cures of five years' duration after the operation, and for the stomach and intestines 20-30 per cent. of cures can be reckoned on. Of the total operated on about 40 per cent. remain permanently healed, and in 60 there is a return of the disease, from which patients are seldom saved by repeated operations. About half of all cancer patients seek advice too late; in other words, nothing can be done but endeavour

to make what period of life remains as painless and comfortable as possible. The means to this end vary from case to case. Natural healing of cancer is a very rare phenomenon indeed, but instances on record are sufficiently authenticated to establish the possibility. In mice naturally suffering from cancer it has been shown that healing occurs in less than 1 per cent., but even this is sufficient incentive to investigate the mechanism of natural cure.

Modern Cancer Investigation.—Since 1898 there has been a great revival in the energy with which the study of cancer has been pursued. Britain has always played a prominent part in the investigation of cancer, and never more so than at the present time. A national organisation was founded in 1902 in London, and has so developed its organisation throughout India, the Colonies, and other dependencies that Edward VII. in July 1904 conferred on it the title 'Imperial Cancer Research Fund.' As such it has obtained the hearing of the whole scientific world and attracts workers from all parts of the globe. There are other important centres of investigation at the Middlesex Hospital and the Cancer Hospital, London; the Royal Cancer Hospital, Glasgow; the Pilkington Cancer Research, Manchester; the University of Liverpool; a sum of money was placed at the disposal of the Royal Infirmary, Dundee; and in Edinburgh there is the 'Dunlop Fund.' Similar activity is manifest on the Continent and in America.

See Paget, *Lectures on Surgical Pathology* (1853); Williams, *The Natural History of Cancer* (1908); Bland Sutton, *Tumours Innocent and Malignant* (4th ed. 1906); Powell White, *The Pathology of Growth* (1913); Cathcart, *The Similarity of Tumours* (1907); Cheyne and Burghard, *Manual of Surgical Treatment* (new ed. 1912-13); Reports of the Middlesex Hospital; Scientific Reports of the Imperial Cancer Research Fund; Annual Reports of the Registrar-general of Births, Deaths, and Marriages.

Cancer Root, or BEECH-DROPS (*Epifagus americanus*), a parasitic herb of the family Orobanchæ (q.v.), a native of North America, growing on the exposed roots of beech-trees. The whole plant is powerfully astringent.

Cancione'ro (Span.; Port. *cancioneiro*), 'song-book,' a collection of lyrical pieces by one or more authors; in particular, the designation of the official collections of the poetic guilds which flourished in the middle ages at the courts of Spain and Portugal. Perhaps the oldest is that of Dom Diniz of Portugal (1279-1325) and his court. There are also *cancioneros* of the courts of Aragon and Castile. The earliest *Cancione'ro General* was published about the end of the 15th century.

Cancrum Oris, also known as Gangrenous Stomatitis, Noma, or Water Canker, is a gangrenous affection of the mouth characterised by fetid sloughing ulcers, which sometimes attacks debilitated children or young persons recovering from measles or other acute fevers.

Candace. See ETHIOPIA.

Candahar. See KANDAHAR.

Candeish. See KHANDESH.

Candelabrum, a term properly meaning a candlestick, but used for a lamp-stand. Few articles were more beautifully wrought than the finer forms of ancient Roman candelabra. Often from 3 to 10 feet high, they were of great variety of form, and were made of marble, bronze, and the precious metals. The bronze candelabra of the Renaissance are also notable art objects.

Candia is the name of the former capital of the island of Crete (q.v.), and was long the only name by which the island was known in western Europe. The city, standing on the north coast, north of

Mount Ida and Knossos, was the only town in Crete where Turks were numerous. During the occupation by the powers, it was here, in September 1898, that the Moslem rising took place, in which a hundred British soldiers were killed and wounded, and which precipitated the definitive removal of all the Turkish garrisons. Pop. 25,000.

Candida Casa. See WHITHORN.

Candle, a cylinder of wax, paraffin, or fatty matter, enclosing a central wick, and intended for giving light. The chief raw materials employed in the manufacture of candles are wax and spermaceti for the more expensive kinds, and tallow, palm-oil, and paraffin for those in general use. Candles are made in three ways—viz. by basting and rolling when wax is the material employed, by dipping when tallow dips and the more modern 'snuffless dip' candles are made, and by moulding when stearin or paraffin or a mixture of both is the material used. The bulk of candles in use are made by this method. Paraffin candles are most largely used in the United Kingdom, but on the Continent stearin candles are preferred. Stearin, the trade-name for stearic and palmitic acids and mixtures thereof, is made from tallow and from palm-oil. It was made available for the manufacture of candles about 1832. Paraffin was practically unknown to the candlemaker until 1847-50, when it was produced in Scotland by Dr James Young from distillation of coal, and subsequently from shale. It is obtained also in large quantities from petroleum in the United States, in Galicia, in Rumania, in Burma, and other countries.

Candle-moulding.—The modern candle-moulding machine is an oblong cast-iron box fixed to frames at each end into which the candle-moulds are securely and accurately fitted. The tips of the moulds are movable, up or down, within the moulds, but they are fixed to the upper end of iron tubes, the lower ends of which are attached to an iron plate or table placed under the box. This table can be raised or lowered at pleasure by means of a rack and pinion fixed to the frames, and when actuated serves to force the candles out of the moulds. Under the table is fixed a box to hold the bobbins on which the plaited and chemically treated wick is wound, one bobbin for each mould. Plaited wicks, first introduced in France in 1825, are now generally used, and obviate the use of the old-fashioned snuffers. The end of the wick is drawn up through the tubes and the moulds by means of an elongated crochet-hook ready for the first filling, and to complete the machine it is provided with two movable clamps to hold one set of candles while another set is being moulded. By this means the wicks are held in position in the centre of the moulds for each succeeding change of candle material. Steam and water pipes are connected to the cast-iron box so as alternately to warm and cool the moulds before and after being filled. When candle-moulding is being done the candle material in a melted state is poured into two troughs at the top of the iron box into which the moulds are fixed, and in this way the moulds get quickly filled. The modern moulding-machines contain from seventy to three hundred moulds each, and produce that number of candles at each filling.

Candleberry, CANDLEBERRY MYRTLE, WAX TREE, WAX MYRTLE; TALLOW TREE, or BAY-BERRY (*Myrica cerifera*), a small tree, or more generally a low spreading shrub, a native of the United States, most abundant and luxuriant in the south. The evergreen leaves are dotted with resin-glands, and are fragrant when bruised. The drupes—popularly called berries—are about the size of

peppercorns, and when ripe are covered with a greenish-white wax; the wax is collected by boiling them and skimming, and is afterwards melted and refined. A bushel of berries will yield four or five pounds. It is used chiefly for candles, which burn slowly with little smoke, and emit an agreeable balsamic odour, but do not give a strong light. An excellent scented soap is made from it. Several species are found at the Cape of Good Hope, one of which (*M. cordifolia*) bears the name of Wax Shrub, and candles are made from its berries. The well-known Bog Myrtle (q.v.) or Sweet Gale is *M. Gale*.

Candle-fish (*Thaleichthys pacificus* or *Osmerus thaleichthys*), a remarkable fish of the family Salmonidæ, nearly allied to the smelt (*Osmerus eperlanus*), if not in the same genus with it. It inhabits the Pacific Ocean, near the western shores of America, from Vancouver Island northwards, and is common in the bay of San Francisco. It is probably the fattest or oiliest of fishes, if not of animals, and is used by the Indians not only as an article of food, but for making oil. The extraction of its oil is now a regular business. To broil or fry it is nearly impossible, because it almost completely melts into oil. When dried it may be burned as a lamp. It is also known as *Eulachon* or *Oulachan*.

Candlemas, an ecclesiastical festival observed on 2d February in honour of the Purification (q.v.) of the Virgin Mary, when she presented the infant Jesus in the temple. The great feast of expiation and purification (*Februa*) in ancient Rome was held on the 15th of February, and the origin of the Christian festival is explained by some as a mere turning to Christian account of the ancient heathen rite. At any rate, the festival seems to have been instituted by the Emperor Justinian in 541 or 542. A principal part of the celebration is a procession with many lighted candles, and those required for the service of the ensuing year are also on that occasion consecrated; hence the name.

The candle-bearing, as old at least as 665, was early explained as a reference to the words of Simeon, when he took the infant Jesus in his arms and prophesied that he should be 'a light to lighten the Gentiles.' The two ideas became associated in the popular mind, and it became customary for women on being *churched* after their recovery from child-birth to carry candles with them. The practice of lighting up the churches in England was prohibited by an order of council in 1548, but still continues in use in the Roman Catholic Church. One old Scottish custom was that the schoolmaster was on this day presented with small offerings by his pupils; and in Scotland this day is one of the four term-days. See **TERM**.

There is a tradition all over Christendom to the effect that a fine Candlemas portends a severe spring. Sir Thomas Browne in his *Vulgar Errors* quotes a Latin distich expressive of this idea. In Scotland the prognostication is expressed in the following distich:

If Candlemas is fair and clear,
There'll be twa winters in the year.

Christ's Presentation, the Holiday of St Simeon, and, in the north of England, the Wives' Feast-day were names given to Candlemas Day. See Ellis's edition of Brand's *Popular Antiquities*.

Candle-nut (*Aleurites triloba*), a small tree of the order Euphorbiaceæ (q.v.), a native of the South Sea Islands, Madagascar, Moluccas, Java, &c., which produces a heart-shaped nut with a very hard shell, and a kernel good to eat when roasted, although in a raw state it possesses in a slight degree some of the active properties so common in the Euphorbiaceæ, and is apt to cause purging and colic. It is about as large as a walnut. An excellent bland oil is procured from it, used

for food, as a lamp-oil, and for making soap, paint, and varnish. The Tahitians bake them in an oven, remove the shell, bore holes through the kernels, and string them on rushes, hanging them up in their houses, to be used for torches, which are made by enclosing four or five strings in a leaf of the screw-pine (*Pandanus*). These torches are often used in fishing by night, and burn with much brilliancy. The lampblack used in tattooing was obtained from the shell of the candle-nut. A gummy substance exudes from the candle-nut tree, which the Tahitians chew.

Candlish, ROBERT SMITH, a great Scottish ecclesiastic, was born in Edinburgh in 1806, but was brought up and educated at Glasgow. Entering the university at twelve, he graduated five years later, and after the usual studies in divinity, and living two years at Eton as private tutor to a Scots pupil there, was licensed as a preacher in 1828. From 1834 he was minister of St George's, Edinburgh, famous for the fervid eloquence and intellectual force of his sermons. Ere long he became one of the boldest and most vigorous leaders of the popular or 'non-intrusion' party. After the Disruption he co-operated with Dr Chalmers in organising, consolidating, and extending the newly formed Free Church of Scotland, and from the time of Chalmers's death down to his own was its virtual leader. He was Moderator of the Assembly in 1861, was made in 1862 Principal of the New College, and in 1865 D.D. by Edinburgh University. Candlish took a foremost part in all the questions discussed within the first thirty years of the life of the Free Church, but his name was most permanently associated with public education, and the movement for union with the other dissenting Presbyterian bodies. He died at Edinburgh, 19th October 1873. Candlish's works were *Contributions towards the Exposition of the Book of Genesis* (1842); *The Atonement, its Reality and Extent* (1845); *An Examination of Mr Maurice's Theological Essays* (1854); *The Fatherhood of God* (1865); and an *Exposition of the First Epistle of St John* (1874). See his Life by Dr W. Wilson (1880).

Candolle. See **DE CANDOLLE**.

Candy. See **KANDY**.

Candytuft, the familiar name for various species of *Iberis*, forming a genus of the order Cruciferae, popularly distinguished by unequal petals, the two larger being towards the circumference of the dense corymbs. The species are chiefly found in the Mediterranean countries, and the English name is supposed to be derived from that of the island of Candia (Crete), the name *Iberis* from Iberia (Spain). One species, *I. amara*, remarkable for its bitterness, is a doubtful native of England. Some species are slightly shrubby, some are herbaceous perennials, some annuals. Some are among the most familiar ornaments of our flower-gardens.

Cane, a term sometimes indiscriminately applied to any small and smooth rod, of the thickness of a walking-stick or less, but more correctly limited to the stems of the smaller palms and the larger grasses. We thus speak of sugar-cane, bamboo-cane, &c., among the latter; while among the former the name is particularly appropriated to the species of the genus *Calamus* (see **RATTAN**). To this genus belong the canes largely imported from the tropical regions of the East for making chair-bottoms, &c. See **BAMBOO**, **WALKING-STICK**.

Canea (Gr. *Khanía*), the present capital of Crete, is situated on the north-west coast, and has a fine harbour. It occupies the site of the ancient *Cydonia*, but the present town is due to the Venetians, from whom it was wrested by the Turks after a two years' siege in 1669. Canea is the principal mart for exporting the productions of the

island—oil, wax, soap, &c.; its harbour is good though shallow. Pop. 24,000.

Cane-brake, a thick mass of *Arundinaria macrosperma*, a colossal reed, nearly allied to the bamboo, which reaches a height of 30 or 40 feet, and forms dense swamp-jungles (sometimes of wide area) in marshy places, and along the banks of the Red River, the Arkansas, the Mississippi, and their tributaries.

Canella (*Canella alba*), a small tree belonging to the natural order Canellaceæ, common in the West Indies, where it is often called Wild Cinnamon. The bark of the young branches is the *Canella Bark* (White Cinnamon) of apothecaries, and is imported from the Bahamas. It is aromatic and stimulant, but now seldom employed in medicine; in the West Indies it is used as a condiment. —Other genera of Canellaceæ are Cinnamodendron (Brazil and West Indies), Cinnamosma (one species, in Madagascar), and Warburgia (one species, in East Africa).

Canclones, a fertile department of Uruguay; area, 1827 sq. m.; population, 120,000. Capital, Guadalupe, 30 miles N. of Monte Video by rail; pop. 3000.

Cang, or CANGUE, an instrument by means of which petty offenders in China are punished. It consists of a large wooden collar fitting close round the neck, varying in size and weight, but not to be removed by day or night during the whole period of punishment, which may vary in length from a fortnight to three months. Its form prevents the victim from stretching himself at full length, and upon this depends in great part the severity of the punishment. He is left also to be starved or fed by the public at their pleasure. The prisoner's name and the nature of his offence are written on the cang in large letters.

Canicatti, a town of Sicily, on the Naro, 24 miles ENE. of Girgenti by rail. Near it are sulphur-mines. Pop. 25,000.

Canicular Days, named from Canicula, Sirius, or the Dog-star, are the Dog Days (q.v.). Canicula is in the southern constellation of Canis Major, near which is that of Canis Minor. For the canicular year, counted from the heliacal rising of the Dog-star, see YEAR.

Canidæ, or CYNIOIDEA, a family or section of Carnivora, occupying a position midway between the cats on the one hand and the bears on the other. The number and disposition of the teeth is less specialised than that of other Carnivora. Other distinctive characters are noted under CARNIVORA. Huxley divided the family into two parallel series: (a) *Thooïd* or *Lupine* types—e.g. Dogs, Wolves, Jackals; and (b) *Alopecoid* or *Vulpine* types—e.g. Fox, Fennec, Lycaon or Cape Hunting Dog, and the primitive Otocyon. Some fossil Canidæ such as *Amphicyon* and *Cynodictis* are still more generalised. See DOG, FOX, JACKAL, WOLF, &c.

Canina, LUIGI, architect, born at Casale, in Piedmont, 23d October 1795, was professor of Architecture at Turin, and afterwards lived in Rome, where he published works of great value on the antiquities of Rome, Veii, Etruria, and Tusculum. He died at Florence, 17th October 1856.

Canister Shot. See CASE SHOT.

Canker is a malignant disease of the horse's foot. It usually attacks horses which have large fleshy-looking frogs, and commences by discharge from the heels or the cleft of the frog. The horn becomes soft and disintegrated, the vascular structures beneath become inflamed, and the horse is lame. Though there is no fever, he becomes emaciated and unfit for work. During wet weather, and on damp soil, the symptoms

increase in severity. The diseased tissues bleed on the least touch, and considerable fungoid granulations, commonly called proud flesh, form rapidly, and there is a continuous discharge of a dirty fluid, which has a most offensive smell. It is most frequently seen in low-bred draught or coach horses, though it also, with too much frequency, affects Clydesdale and other stallions. Dirt, cold, and wet favour the production of the disease, and there is always a tendency to relapse when once an animal has been affected. By way of treatment, pare away detached portions of horn, and, in mild cases, sprinkle powdered acetate of copper over the sore; apply over this pledgets of tow, fixed over the foot by strips of iron or wood passed between shoe and foot. In severe cases tar and nitric acid, creosote and turpentine, chloride of zinc paste, and other active caustics have to be used for a time with the regular employment of pressure on the diseased surface. The animal requires to be treated constitutionally, and good food, fresh air, and exercise often aid much in the treatment of the disease.

Canker, a disease of plants fatal especially to fruit-trees. It is caused by a fungus, *Nectra ditissima*, which finds an entrance through wounds. See PLANTS (Diseases).

Canna, a genus of reed-like plants, type of the order Cannaceæ (often united to Marantaceæ), some species of which (especially *C. Indica*) are known from their hard heavy seeds as Indian Shot. Natives of the tropics, they are cultivated in our gardens for their ornamental foliage and show of flowers. The root-stocks are farinaceous, and one species in the West Indies yields the starch called *tous-les-mois*.

Canna, one of the Inverness-shire Hebrides, 12 miles SW. of Skye, and 3 NW. of Rum. It is $4\frac{1}{2}$ miles long, 1 mile broad, and $4\frac{1}{2}$ sq. m. in area. The surface is nowhere higher than 800 feet. A hill of basalt, called Compass Hill, reverses the magnetic needle.

Cannabinaceæ, a sub-order of Moraceæ (q.v.), containing two genera, both of them valuable, *Cannabis* and *Humulus*. See HEMP and HOP.

Cannæ, an ancient town of Apulia, in southern Italy, not far from the mouth of the Aufidus (now Ofanto), and $1\frac{1}{2}$ mile N. of the modern Canosa. Here, in the summer of 216 B.C., Hannibal (q.v.) with 50,000 men defeated with prodigious slaughter a Roman army of 86,000 men under Æmilius Paulus and Terentius Varro.

Cannamore, a seaport and military station of the district of Malabar, in Madras, about 50 miles to the N. of Calicut. The town stands at the head of a bay; while the fort and cantonment occupy the bluff headland which shelters the inlet on the side of the Arabian Sea. The town has several mosques, and there is a lighthouse in the old fort. Pop. 30,000.

Cannes, a watering-place in the French department of Alpes-Maritimes, charmingly situated on a bay of the Mediterranean, 17 miles SW. of Nice. Founded by the Romans on a promontory between their *Via Aurelia* and the sea, during the middle ages it was held as a fief by the convent of the Lérins, and Abbot Adelbert began to build the *Vigie* or watch-tower in 1070. It was repeatedly attacked by the Barbary pirates, and twice entered by Charles V. The most disastrous year ever known was 1580, that of the great plague; though during the wars of religion it was sacked by the Duke of Savoy. When Masséna lived in it and Murat gave a ball on the shore (1815), it contained about 3000 inhabitants. It was in the roadstead of the Golfe Jouan that Napoleon landed when he

returned from Elba. Entering Cannes after dusk, he made his bivouac on the shore, but left it at 2 A.M. of the 2d March 1815, to march by the hill road, *viâ* Grasse and Digne, upon Grenoble and Paris. Lord Brougham first (1834) selected Cannes as a health-resort. Pop. 31,000, doubled in winter. Alexis de Tocqueville, Prosper Mérimée, Louis Blanc, Victor Cousin, Auerbach, and J. B. Dumas died in Cannes.

Cannes is celebrated for the salubrity of its climate. A range of low wooded hills shelters it from the north, and it occupies the centre of the great curved bay, 14 miles in width, of which the Cap Roux and the Cap d'Antibes form the extremities. It has a small port, and a trade in flowers. There are farms of violets, roses, oranges, tuberoses, jessamine, and cassia.

Cannibalism, the practice of eating human flesh as food, is widely spread among many of the lower races, but has not infrequently held its place even among peoples at a comparatively high level of culture. It has been held that primitive man would eat human flesh from mere famine or necessity—as has often been done in extreme cases even in the higher races under the pressure of the same forces—but would leave off the practice as he climbed in culture. But this is by no means always the case; the ancient Mexicans, a people of exceptionally high native culture, were yet excessively addicted to cannibalism. And even at the present day some of the most advanced and advancing of negro races, the Monbutts, Zandebs, Fans, and other tribes in the large central zone of anthropophagy that crosses Africa from east to west, habitually practise cannibalism in its most repulsive forms, even to the length of buying and selling human flesh for ordinary diet. Again, the New Guineans are fine men physically and intellectually; and the Maoris of New Zealand were cannibals till near the middle of the 19th century. Nowhere was the practice more widespread than in the South Seas, especially in the Fiji, New Hebrides, and New Caledonian groups. If it be true that the primitive reason for the practice is sheer hunger or the desire to eat flesh, the habit, once contracted, would grow into a confirmed appetite. Upon cannibalism from necessity or mere gluttony follows easily enough cannibalism from war-like fury, as was very common with the North American Indians, among whom eating the flesh and drinking the blood of an enemy meant something more than metaphor. Cannibalism among the Battas seems to spring from the idea of giving the dead relative the safety of a friendly grave in the stomachs of his living relatives. Aged relations and new-born children, as well as friends or children who had died by mischance or mere accident, have been eaten by many primitive peoples, notably in Australia. Often a savage desires to eat the flesh of a valiant enemy in order that his courage might pass into himself—a magical or religious cannibalism, almost a kind of eucharistic rite, which marks the highest development of the practice, and was found among Maoris, Australians, North American Indians, and the old Aztecs. The notion of presenting food to the gods is almost universal among savage peoples, and this would naturally be human flesh among a people to whom cannibalism was customary. It seems to have been proved that human sacrifices with no other origin than cannibalism survived even in cultured Greece. On the other hand, there are Australian tribes who eat their slain friends but not their enemies, while others eat their new-born children, or in some cases only the eldest. In one tribe a mother eats her own children, and the children their mother; while the father does not feed on his offspring, nor the offspring on their

father—an undoubted survival of female kinship, when the father, as a member of a different tribe, had no right to eat the flesh of his own child. Apparently cannibalism was not a normal condition of the life of primitive man, whose dentition and digestive organs of themselves point rather to a diet of fruits; originally it was no more than an occasional practice, as in historic times. Yet so ingrained does the habit become that in French Equatorial Africa, as Boudet-Saint reports, since the suppression of cannibalism, the loss of this wholesome and abundant nourishment has produced unmistakable physical degeneration amongst certain anthropophagous tribes. Some contend that the origin of cannibalism must always be sought in actual hunger, and that the magical and religious usages were later developments. Others insist that this will not explain some customs—for example, the law that in certain tribes prescribes that the members of it shall eat only their fellow-tribesmen, and that here at least a ritual or ceremonial origin must be assumed. In view of the very varying laws and customs of anthropophagy, it is perhaps safest to hold that the origin has not everywhere been the same or even similar, and that the unholy habit has not in every race or region had the same historical development.

Canning. See PRESERVED PROVISIONS.

Canning, CHARLES JOHN, EARL, third son of George Canning, was born 14th December 1812, and was educated at Eton and Christ Church, Oxford, where he obtained high honours. He entered parliament in 1836 as Conservative member for Warwick, but next year was raised to the Upper House as Viscount Canning by his mother's decease, both his elder brothers being already dead. In 1841 he became Under-secretary of State for Foreign Affairs in Sir Robert Peel's government, and afterwards Commissioner of Woods and Forests. When Lord Aberdeen came into office, he was made Postmaster-general; and in the beginning of 1856 he succeeded Lord Dalhousie as Governor-general of India. The first important event of his government was a war with Persia, which was brought to a successful close in 1857. In the same year (10th May 1857) the Indian Mutiny began with the outbreak at Meerut. Lord Canning's conduct during the awful crisis was decried at the time as weak and pusillanimous; he was nicknamed 'Clemency Canning;' but the general opinion now, when all the circumstances of the case are better known, is that he acted with singular courage, moderation, and judiciousness. In 1858 he became the first Viceroy; next year he was raised to an earldom; but having lost his wife in 1861, he retired from his high office in March 1862, and died in London on 17th June in the same year. See Sir H. S. Cunningham's *Earl Canning* (1892).

Canning, ELIZABETH, the heroine of a remarkably obscure story, was born in 1734. Already she had been in domestic service for some years in London and borne a good character, when about nine o'clock on the night of New-year's Day, 1753, she disappeared on her way home from a visit to an uncle and aunt's house. Neither the loudest hue and cry nor prayers in the churches had done anything to solve the mystery, when late at night (29th January), four weeks after her disappearance, the girl knocked at her mother's door, hungry and half-clad. She said she had been seized by two men and carried by force to a house on the Hertfordshire road, where she had been ill-used by an old woman, and starved in an upper room, to compel her to an immoral life. She identified Susannah Wells and an old gypsy named Mary Squires as her persecutors, and these were accordingly arrested, and they passed in the first stage before the novelist Henry

Fielding, then a Bow Street magistrate, who afterwards published a paper on the case; next they were tried at the Old Bailey, and sentenced, in spite of an alibi for Squires sworn by three witnesses, Squires to be hanged, Wells to be burned in the hand. The Lord Mayor, Sir Crisp Gascoyne, felt unsatisfied with the verdict, and made further investigations, which resulted in so strong an accumulation of fresh evidence to fortify Squires's alibi that a free pardon was granted her by the crown. The case now became the excitement of the town, and opinions were fiercely divided between the 'Canningites' and 'Gypsyites,' so that the heroine of this miserable story became in Churchill's phrase, 'with Gascoyne's help, a six months' feast.' On the 29th April 1754 she was put on trial at the Old Bailey for perjury, and after an eight days' trial, in which the jury seem to have been completely puzzled between the thirty-eight witnesses who swore that Squires had been seen in Dorsetshire, and the twenty-seven who swore to her having been in Middlesex, was sentenced to transportation for seven years. She was sent to New England, and died in Connecticut in 1773. See Paget's *Paradoxes and Puzzles* (1874), and A. Machen, *The Canning Wonder* (1925).

Canning, GEORGE, a distinguished British statesman and orator, was born in London, 11th April 1770. His father, who claimed descent from William Canynge of Bristol, incurred the displeasure of his family for marrying beneath his station, and died in poverty when his son was only a year old. His mother tried the stage with but little success, married an actor, and subsequently a linen-draper, but lived to rejoice in the success and participate in the good-fortune of her boy, whose education was liberally provided by his uncle, Stratford Canning, a banker. Canning was sent to Eton, from which he passed at the age of eighteen to Christ Church College, Oxford, where he greatly distinguished himself, especially in classics. While here, he cherished the friendship of the Hon. Charles Jenkinson (afterwards Lord Liverpool), who was of considerable service to him in after-life. From Oxford he went in 1790 to Lincoln's Inn, but on the suggestion of Burke, as it is said, he soon relinquished the bar for a parliamentary career. He entered the House for Newport, Isle of Wight, in 1794, as the protégé and supporter of the minister, Pitt. In 1796 he was appointed an under-secretary of state. It was not, however, until 1798 that Canning made a reputation as an orator and a statesman, by his speeches in favour of the abolition of the slave-trade and against Tierney's motion regarding peace with the French Directory, the latter of which, especially, was regarded as a masterpiece of eloquence, alike by the House and the country. In many important questions Canning gave valuable assistance to the ministry, not only by his voice in parliament, but by his pen in a satirical paper called the *Anti-Jacobin* (1797-98), in which (with Hookham Frere, George Ellis, and others) he especially lashed the 'New Philosophy,' as it was called, promulgated by the French republicans. The 'Needy Knife-grinder' is one of the best known and happiest efforts in this kind. In 1800 he made a happy marriage with Joan Scott, a lady of fortune, and sister to the Duchess of Portland. In 1801 Pitt resigned office, and Canning joined the opposition from the ministerial side of the House against the Addington ministry.

When Pitt again became premier in 1804, Canning was made treasurer of the navy, an office which he held until Pitt's death in 1806. His opposition to the short-lived Grenville ministry which succeeded savoured of the bitterness of party feeling, and his treatment of Fox in his last

days, and of his memory after his death, was far from generous. When the Portland ministry was formed in 1807, Canning was appointed Minister for Foreign Affairs, a position for which he was specially qualified, and his despatches written at this time are models of manliness and lucidity. During his tenure of office Canning planned the expedition for the seizure of the Dutch fleet, which did so much to upset the schemes of Napoleon; and he recommended the energetic prosecution of hostilities in Spain both under Moore and Wellesley. His disapproval of the Walcheren expedition led to a misunderstanding with Castlereagh (q.v.), secretary-at-war, which resulted in a duel with that statesman. Soon afterwards the Portland ministry came to a close, and Canning did not hold high office again for many years. His absence from the Foreign Office during the critical period at the close of the Napoleonic wars was to Canning a subject of lasting regret. In 1812 all his eloquence was enlisted in favour of Catholic emancipation. During the same year he was elected for Liverpool, which seat he exchanged for Harwich in 1822. In 1814 he went as ambassador to Lisbon, returned in 1816, and was made President of the Board of Control, and supported the Liverpool ministry in all their arbitrary and repressive measures until 1820, when he resigned, in consequence of the action of the government against Queen Caroline.

Nominated Governor-general of India in 1822, he was on the eve of departure when the suicide of Castlereagh, now Marquis of Londonderry, called Canning to the head of Foreign Affairs. In this capacity he conferred lasting benefits on his country. He infused a more liberal spirit into the cabinet, he asserted the independence of British politics against the diplomacy that would have entangled the nation with the Holy Alliance, and gave a new direction and impetus to commercial affairs by a gradual laying aside of the prohibitive system. He arranged the relations of Brazil and Portugal; drew the French cabinet into agreement with the British respecting Spanish-American affairs; was the first to recognise the free states of Spanish America; promoted the treaty combining England, France, and Russia, for the settlement of the affairs of Greece, which was signed 6th July 1827; protected Portugal from Spanish invasion; contended earnestly for Catholic emancipation; and prepared the way for a repeal of the corn laws. In February 1827 a stroke of paralysis forced the Earl of Liverpool to resign, and Canning was called upon to form a new administration, which he did with the aid of the Whigs. His health, however, gave way under the cares of office, and he died 8th August of the same year at the Duke of Devonshire's Chiswick villa, in the room where Fox had died twenty-one years earlier. He was buried, near Pitt, in Westminster Abbey. As a parliamentary orator Canning holds a prominent place in British annals. His acuteness, power of expression, and well-pointed wit were remarkable; he lacked the imposing character of Pitt, the overpowering enthusiasm of Burke, and the winning address of Fox; but he was intensely British, and his foreign policy was carefully calculated to promote British interests.

See his *Speeches* edited by Therry (6 vols. 1828); Stapleton's *Political Life of Canning* (1831), and *George Canning and his Times* (1859); the masterly sketch in Lord Dalling's *Historical Characters* (1867); Lives by Frank Hill (1887), Marriot (1903), and Temperley (1905).

Canning, STRATFORD. See STRATFORD DE REDCLIFFE.

Cannock, a town of Staffordshire, 8 miles NNW. of Walsall; pop. (1851) 2099; (1921) 32,321. The adjoining bleak and moory Cannock Chase, an enclosed common, is rich in coal and iron.

Cannon, a strong tube, closed at one end permanently (muzzle-loading) or as required (breech-loading), for propelling missiles by the force of the gases of an explosive fired therein. The word is derived from the Latin *canna*, a reed or pipe. The term 'cannon' also implies a weapon of greater size than can be transported or handled by a man, and therefore provided with some sort of mounting or carriage on which it is manipulated or transported. The word 'cannon' is not now commonly used, but has been superseded by the word 'gun.' Unfortunately the word 'gun' is also used for the sporting small-arm—the military small-arm being termed a rifle.

Included under cannon are howitzers and mortars. Howitzers are short guns of large calibre in proportion to their length, and are intended for firing at higher angles and lower velocities than guns. They are designed for searching out, by curved fire, troops or material under cover. They are mounted and used similarly to guns, but are provided with several charges designed to enable them to employ the highest possible angle of elevation, and therefore the steepest angle of descent for their projectiles, at all ranges. Mortars were still shorter than howitzers. They were fixed in their 'beds' (mountings) at a permanent angle of elevation of 45°, and their charges were varied in order to obtain the range required. They played a great part in the attack and defence of fortresses during the smooth-bore period, and for nearly 300 years were the only weapons which fired a shell filled with explosive and furnished with a time-fuse. They have been quite superseded by howitzers for ordinary warfare where mobility is essential, but reappeared in trench warfare in 1914-18. (See BOMBS.)

The history of the invention and early development of the propulsion of projectiles by explosives will be found in the article on Firearms; and the *bombard* period, which lasted from about 1330 to 1450, and during which cannon, often of great size and sometimes breech-loading, were built up of bars and hoops of wrought-iron, is passed over without comment. The transition period also—from 1450 to 1500 approximately—in which the casting of cannon began to be generally adopted, although the bombard form was sometimes retained, calls for little remark, for it is not too much to say that the effect of this early artillery was almost wholly moral, except for its power of making breaches in fortifications.

During the next fifty years the bombard form disappears, and cannon, cast both in bronze and

Fig. 1.

iron, possess every feature appearing in those cast during the next 300 years.

Fig. 1 represents a 6-inch iron 'Cannon Royal' of 53 cwt. of the time of Henry VIII. It would be a 27-pounder gun approximately (making an allowance of 0.2 inch for windage), and compares well with the 24-pounder broadside gun of Nelson's time and later. The naval broadside mounting, judging from a drawing in *Artiglieria*, by Sardi (Venice, 1621), had also probably assumed the form which it was to retain during the same period (see fig. 2 of a 24-pounder gun and carriage as in use up to the end of the smooth-bore period).

Fig. 3 shows a field-gun and carriage of the end of the 16th century from the *Prattica Manuale*

dell'Artiglieria by Collado (Milan, 1606), which has practically all the essentials of such combinations until the adoption of limber-boxes towards the end of the 18th century. Contemporary treatises show that the rammers, sponges, and 'side-arms' generally used for loading were very similar to those now in use, that made-up cartridges in bags were known, and that the essentials of good gunpowder were well understood at this time.

Fig. 2.

Figs. 4 and 5 are taken from Tartaglia's *Colloquies* and Lucar's Appendix thereto (London, 1588), and represent respectively the 'gunners' square,' and 'gunners' rule.' The former was used, unchanged

Fig. 3.

in form, until about 1830, for giving quadrant elevation, when it began (in the British service) to be superseded by the quadrant with a spirit-level instead of a plumb-bob. The 'gunners' rule' is quite a refined instrument, and was probably rarely used; for had it met a regular want, especially after the adoption of 'quarter-sights,' described hereafter, the adoption of the tangent scale, which is only a modification of it and much more handy, could not have been delayed for close on 200 years. The 'gunners' rule'

Fig. 4.

was placed centrally on the breech of the gun, with the central slider carrying the peep-hole clamped at the required elevation (in the figure it is set at division 3), and aim was taken

by looking through the peep-hole and bringing a pin, or more probably a notch, on the centre of the top of the muzzle and the object aimed at into one line. It will be noticed that in this example (though not usually) a plumb-bob and scale are also provided for giving quadrant elevation, or by turning the instrument through 90°, for ascertaining the level of the trunnions. It may be added that the effect of the axis of the trunnions not being horizontal, in altering the direction of the flight of the projectile, was quite well known.

As to projectiles, shell-fire from guns did not come in for over 200 years (with the exception of its use by the defenders at the siege of Gibraltar

Fig. 5.

in 1779-83—an isolated instance) owing to the lack of a good time-fuse, and shot of various kinds were the only projectiles; but shell-fire with time-fuses from mortars had been used as early as 1543.

It will thus be seen that most of the essentials of a good artillery were well known at the close of the 16th century; and the efficiency of artillery, as proved by actual results in war, was in marked contrast with the inefficiency of the small-arms of the same period, for as late as 1590 there were advocates for the long-bow, owing to the inaccurate and slow fire of small-arms. During the remaining 250 years of the smooth-bore period there were many improvements in ammunition and in lightening the field-artillery equipments to render them more mobile and handy; but there were no changes whatever in principle, and a skilled gunner of the end of Elizabeth's reign would have found little or nothing wholly unfamiliar in the armaments of 1850.

The period 1500 to 1600 should be of extraordinary interest to the Briton, for in it were evolved the system of naval armament and the method of using it, which remained practically unchanged during the building up of the British Empire, in which sea-power has had such an enormous influence.

Briefly put, at the commencement of the reign of Henry VIII. the notion was undisputed that the galley propelled by oars, which fought by ramming and then by boarding with soldiers, and hardly employed artillery fire at all, was the warship *par excellence*; and, even in the case of sailing-ships, that the governing tactics should be to get to close quarters and board with soldiers without much preliminary artillery action. Henry and his advisers started the reversal of these tactics by building ships heavily armed on the broadside, and intended first to disable the enemy by heavy artillery fire, and then only, and not even necessarily then, to come to close quarters and board. These new tactics were brought to perfection by the Elizabethan sailors; the galley ceased to exist as a warship, and the warship ceased to be regarded merely as a transport for soldiers to be used for boarding purposes.

As regards the manufacture of guns in England at this early period, mention is made in 1384 of 'William the Founder of London' selling guns, stones, and powder, but there is no definite mention of his making them. There is, however, no reason to suppose that England had necessarily to go abroad for guns, as there had been ironworks in Sussex from Roman times, and ordnance were made there in the 14th century. The first iron gun was cast in England by Huggett of Uckfield, in Sussex, in 1521. A similar claim is made for Hogge of Buxted, which place is within a few miles of Uckfield.

Turning now to later improvements, figs. 6 and 7 show a 6-pounder field-gun, carriage, and limber,

Fig. 6.

and is typical of the equipment of the British Field Artillery from the commencement of the 19th century until the end of the smooth-bore period. It was of its kind excellent, and called forth quite extraordinary encomiums from the French experts in 1815 (see *Études sur le Passé et*

l'Avenir de l'Artillerie, by Napoleon III., Paris, 1846-71).

Though it does not appear in the figure, the gun (and all *field*-guns in the British service) was furnished with a tangent-sight. The exact date of the general introduction of this sight into the

Fig. 7.

British service has not been quite definitely fixed, but it might have been as early as 1780, and certainly was earlier than 1794. In the French service this sight was tentatively adopted in 1765, and finally in 1774. The principle of this sight is shown diagrammatically in fig. 8 (a) and (b). During the time the projectile travels over the distance (MB) from the muzzle to the bull's-eye (B), it will, owing to gravitation, fall through a certain distance. The axis of the gun must therefore be pointed sufficiently above the target so that this fall shall bring the projectile on to the bull's-eye.

Fig. 8.

This is done by raising the notch, or peep-hole (T), of the tangent-sight bar (TS) to a certain height, corresponding with the range, above the socket on or in the breech, clamping it by the screw shown, and then getting the peep-hole, or notch, the fore-sight (F), and the bull's-eye (B) into a straight line. By this process the axis of the gun is directed at a height (BA) above the bull's-eye (B). The tangent-sight is graduated to achieve a similar result at all distances up to the extreme range at which it is intended to employ the gun. The projectile travels over the curved path (MCB); see PROJECTILES. The tangent-sight in fig. 8 (b) shows a 'deflection leaf,' clamped by a milled-headed screw, for giving deflection to allow for wind, &c. This was not introduced until 1860.

Prior to the adoption of tangent-sights, quarter-sights had been taken into use at least as early as 1734 for all guns used in the British naval service, and probably for land service also. These supplemented the 'gunners' square,' and probably wholly superseded the 'gunners' rule.' They consist (see fig. 8, a) of a notch (M) on the side of the muzzle and a scale (Q) of three to four notches,

representing degrees, on the side of the breech. The principle of their use is clear from the figure, in which the gun is 'laid' with 4° elevation by the quarter-sight. Experiments with tangent-sights commenced in the British navy at least as early as 1804, and by 1817 considerable numbers had been made, and were kept ready in store for use; but the date of the general adoption of these sights is not accurately known. The dates for the introduction of tangent-sights in the British services given above are considerably earlier than have hitherto been accepted; but see an article by the present author in the *Journal of the Royal Artillery*, vol. xxxix., No. 8 (Nov. 1912).

Tangent-sights were generally adopted for all guns in the land service in 1846, and during the last forty to fifty years of the smooth-bore period the siege and heavy field equipments had been rendered very fairly efficient. In fortresses, guns and carriages in important positions were mounted on traversing platforms. The carriages used were very similar to the naval carriage shown in fig. 2. Both carriages and platforms were usually of wood.

As already stated, there were practically no changes of importance in the heavier guns and mountings in the navy up to the end of the smooth-bore period; but the carronades (short guns of proportionately large bore, so named from being made at the Carron Ironworks, and invented in 1779) and smaller guns firing from the upper decks were in some cases provided with traversing platforms (see fig. 9). Prior to about 1734 it is

Fig. 2.

under the breech. The very short ranges at which naval engagements were usually fought probably rendered sighting refinements unnecessary.

Rifled Guns.—For the early history of rifling, the article on Rifles should be consulted. It was not until 1855 that rifling for cannon began to be seriously considered in Great Britain, though Robins had urged its adoption as early as 1745, and records exist at Woolwich of trials of a rifled 6-pr. gun in 1792. See an article by the present author in the *Journal of the Royal Artillery*, vol. xl., No. 4 (July 1913). There had also been some trials of rifled guns proposed by Major Cavalli and Baron Wahrendorff prior to 1846, and some of the existing smooth-bore guns rifled with two large grooves, forming an oval bore, on the Lancaster system, were sent to the Crimea in 1854—which guns burst badly, showing, as was soon accepted, that cast-iron guns were quite incapable of standing the greater strains put on them by the heavier elongated projectiles.

In 1855 Armstrong brought forward his breech-loading rifled gun, which, after prolonged trials, was adopted for the British service in 1859. A drawing and description of the breech mechanism of Armstrong's first system will be found in the article on Breech-loading; and, except in one particular, it is unnecessary to discuss fully the advantages and disadvantages of this system, as it lasted such a short time. The breech mechanism was not sufficiently safe if carelessly handled, and in the larger guns it was very cumbersome, while the lead coat on the projectiles, which was engraved by the rifling and gave rotation, was expensive, and its attachment to the projectiles not entirely reliable.

The guns, however, shot excellently, and were without doubt the best in existence at the time of their adoption.

It is, however, necessary to describe somewhat fully a novel feature in the construction of the bodies of guns made on the Armstrong system—viz. the building up of the gun in several parts. This method has been universally adopted, and is the foundation principle of gun manufacture at the present time, and, as far as can be seen, must always remain so.

In order fully to understand the object of Armstrong's innovation, it is necessary to consider the two main stresses to which the walls of the bore of a gun are subjected when it is fired and the gases of explosion are driving a projectile before them. The first, termed the circumferential stress, tends to split the gun along a more or less horizontal line; the other, the longitudinal stress, to tear the gun into two parts along some vertical line—assuming, of course, the gun to be approximately in a horizontal position when fired. The circumferential stress is the more difficult to meet, and is alone considered in what follows.

To resist rupture by circumferential stress we have, of course, the strength of the metal of the gun, but in a cast gun the different layers of metal forming the walls do not by any means all do an equal amount towards the prevention of rupture; for the stress on each layer can be shown to vary approximately inversely as the square of its distance from the centre of the bore. Thus, if we assume a gun of 12-inch calibre with a wall 10 inches in thickness, the outside layer only does approximately $\frac{1}{16}$ th part of the work done by the layer at the surface of the bore. It therefore follows that the metal near the bore can easily be strained beyond its endurance, however thick the walls may be, and the gun will be split, as it were, progressively. Armstrong solved the problem by making the gun in several layers, consisting of a tube of steel (at first of wrought-iron) over which were shrunk hoops or tubes of iron. This was effected by boring out the hoop to an interior diameter slightly smaller than the exterior diameter of the tube (or hoop where there is more than one layer) over which it is to fit. The hoop is then heated to expand it sufficiently to be fitted over the tube, and, on cooling, as it cannot return to its original size, is always gripping the tube with a force which follows known laws. It is therefore always ready to assist the tube immediately the latter is expanded by the powder gases on firing. This system is known as that of 'initial tension.' Obviously it cannot be applied so that each layer of a gun shall do exactly the amount of work theoretically required by its position, since that would necessitate the use of hoops infinitesimally thin, but it enables guns to be built up so that but little of the weight of metal used is wasted. In certain portions of wire-wound guns (to be discussed later), however, the disposition can be nearly theoretically perfect in this respect.

In 1866, troubles which occurred in the China war of 1860, owing to the breech-blocks occasionally blowing out, and a general dissatisfaction with the comparative complications of the Armstrong system, led to the adoption of rifled muzzle-loading guns in both services. These guns were built up on the Armstrong system, but with the number of layers of shrunk-on material somewhat reduced for cheapness' sake, and were quite as good as any foreign guns of their date, and of course extremely simple to handle. They differed, in fact, hardly at all from their smooth-bore predecessors, except in having elongated projectiles and better ammunition. Fig. 10 of a 38-ton 12.5-inch gun may be taken as typical of the construction.

The rifled muzzle-loading period may be said to have lasted until about 1882. During the sixteen years which it lasted the size of the guns made increased in an astonishing manner, owing mainly to the increase in thickness of the armour on war-ships and the efforts to produce guns firing projectiles designed to perforate it. At the end of the Armstrong breech-loading period in 1864, the biggest gun was the 7-inch of 81 cwt., propelling a projectile of 110 lb. By 1871 the 12-inch of 35 tons, with a projectile of 600 lb., had been made, and by 1882 there was the 16-inch of 80 tons in both land and naval service, with a projectile of 1700 lb., and in the land service a few 17.72 guns of 100 tons, firing projectiles of 2000 lb. These and the smaller guns constituted a highly efficient and formidable armament; but with the introduction of the large-grained, slow-burning gunpowders, moulded into prism form, which required great length of bore for their combustion and best ballistic effects, the days of muzzle-loaders, especially for use on ships, were numbered. To run back these long guns to get at their muzzles in order to load necessitated provision of great space in rear of them—space which could not possibly be spared on board ship.

The adoption of rifled guns immediately necessitated many alterations in the mountings; and although some of the earlier naval and fortress

Fig. 10.

rifled guns were mounted on carriages which differed little from those used for smooth-bores, the rapid increase in the size and power of guns necessitated drastic changes in the mountings to control the recoil, and also to enable the guns to be handled. This was especially the case on board ship, where the pitching and rolling of the ship brought in special difficulties. Powerful gear had to be introduced to replace the old rope-tackles and handspikes, and on board ship the heavier guns had to be worked by hydraulic power. To control the recoil special mechanical means had to be introduced to check the movement of the gun and carriage to the rear, and to bring them to rest. In early times on board ship the necessary resistance had been provided by the friction of the rope in the blocks forming part of the tackles by which the gun-carriage was attached to the side of the ship (assisted by heavy 'breaching ropes,' which passed round the breech of the gun and brought it up short when the extreme recoil permissible was reached), and hauled back into the port for firing, after the gun had been loaded, in the recoiled position. On land the incline upwards to the rear of the gun emplacement or traversing platform, coupled with brake-scothes on the wheels of the carriages (or in some cases, there being no wheels, on the rear cross-piece at the bottom of the carriage, so that there was great frictional resistance), served to check recoil. After a short period, in which it was sought to govern recoil by the friction of plates on the platform jammed between plates on the carriage, the recoil-buffer was introduced, which has become as essential a feature of modern

heavy mountings as initial tension in the gun. The principle of the arrangement is shown diagrammatically in fig. 11. The mounting has two buffers, one of which is shown in section. A is a cylinder full of oil attached to the underside of the carriage (B). In A travels a piston (C) attached by a rod (D) to the front of the platform (E) at F. The piston (C) has holes in it. If now the carriage move to the rear, in the direction

Fig. 11.

of the arrow, the oil in the cylinder must pass through the holes in C from the front to the back of the cylinder. Great friction is set up by this passage of the oil, which, however, can be regulated with extreme precision, and an ideal method of checking recoil is obtained. As stated, the system is only dealt with diagrammatically, and there are endless variants of the principle. The buffer often contains a spring which is compressed during recoil, and runs the gun out to the firing position independently of gravity. Steel or iron absolutely replaced wood as a material for the larger mountings, and in the case of siege-mountings also, steel or iron rapidly replaced wood; and although the field-guns were at first mounted on wooden carriages, these were soon replaced by iron ones.

Second Breech-loading Period.—The last new muzzle-loading gun—a 10.4-inch—was made in 1887 and after the second breech-loading period commenced about 1882. The description of breech mechanism adopted will be found in the article on Breech-loading. Apart from this change, the increased reliability of steel had permitted of the all-steel construction of guns being adopted, with the result that for the same weight a gun of greatly increased power could be produced. Fig. 12 shows a 9.2-inch gun of this construction, to which guns as large as the 16.25-inch of 110 tons weight were made. Guns larger than 12-inch calibre were not

Fig. 12.

made between about 1895 and 1910, as it was considered that the gain in power was compensated by the increased difficulties in control of recoil and in provision of ease of handling.

All large and many small guns made for the British services since 1894 have wire wound over their inner tubes to provide circumferential strength instead of the shrunk-on hoops already described. Fig. 13 shows a 12-inch wire-wound gun. The wire is shown by the longitudinal hatching, and it will be noticed that a 'jacket' in rear and a tube in front completely cover the wire, while the jacket locks the front of the gun to the breech, giving the necessary stiffness, in addition to that of the inner tubes, to prevent the gun bending by its own

weight. As there has been a good deal of discussion and criticism of the wire-wound gun, it may be well to touch briefly on the merits and demerits of wire-winding. Taking the latter first, the only objection which can be urged against wire is that it adds absolutely nothing to the longitudinal strength of a gun, whereas with the shrunk-on hoop system, even if the hoops be numerous and small, a certain amount of cohesion of the hoops can, by suitable arrangements, be obtained; and such a gun will be stiffer and less liable to bend by its own weight. The answer to this is that with a suitable jacket ample strength can be, and is, provided to resist bending and, in conjunction with the inner tubes forming the bore, to meet the longitudinal stress of firing. The advantages of the system are that every yard of the wire is tested, whereas only a minute part of a hoop can be so tested, and the result of such a test is not necessarily a guarantee of the whole; that steel wire is much stronger and tougher than steel in hoop form, and as a result the margin of safety with it is much higher if it be only stressed to the same degree as a hoop, as is usually the case, or, if necessary, less of it can be used and a lighter gun be produced of the same power; and, lastly, that the required initial tensions can be much more accurately and easily given by winding than by boring and shrinking.

It will be noticed in fig. 13 that 'thrust-collars' instead of trunnions are provided, and that the inner tube forming the bore is covered by another

tube. The object of the latter is to provide for easy retubing when the rifling has been worn and eroded by firing. A modern 12-inch gun with a muzzle velocity of about 2800 to 2900 feet per second requires a new tube after firing about 150 rounds, so that such a provision is very necessary.

Quick-firing Guns.—The 6-pounder and 3-pounder guns, which have a cartridge similar to that of a rifle—i.e. have the projectile with its charge and cap combined—were adopted in the British service as early as 1885 for repelling the attack of torpedo-boats. These guns are mounted in 'cradles,' in which they have an axial recoil, controlled by hydraulic buffers, which buffers are also provided with springs by which the gun is returned to the firing position immediately after recoil. The cradle is attached by trunnions to a pivot, which is carried on, and can turn round in, a pedestal which is firmly fixed to the deck or gun emplacement. To the cradle is attached a shoulder-piece, and a pistol-grip and trigger are provided in such a position that a man can comfortably reach it with his right hand, while with his shoulder against the shoulder-piece he can traverse or elevate the gun as he looks over the sights. In effect he uses the gun just as he might use a rifle if it were mounted on a pivot. A second man opens and closes the breech, and a third man supplies ammunition.

In 1888 Messrs Armstrong, Whitworth, & Co. brought forward a modification of the system for heavier guns. In this case the projectile was

Fig. 13.

loaded separately from the cartridge, but the latter consisted of a charge contained in a brass cartridge-case carrying its own means of ignition (see BREECH-LOADING). In the ordinary breech-loading gun the projectile and charge are loaded separately, and, the breech having been closed, the means of ignition—the tube (see CARTRIDGE)—is put into the vent. In the case of electric tubes, however, the tube in the British service is inserted into the breech-screw before the closing of the breech. The quick-firing system was applied to guns as large as the 6-inch (100-pounder). It gave a considerably increased rate of fire in the smaller natures up to the 4-inch (25-pounder), but very little increase in calibres larger than this; for, as the weight of the projectile becomes larger, the handling of it becomes the governing factor in speed, and the making of guns for ammunition of this class for calibres above 4-inch has been discontinued in the British service (see fig. 15 of a 12-pounder quick-firing gun).

In 1901 'fixed' ammunition similar to that for the 6-pounder and 3-pounder was adopted for the 15-pounder field-gun, and in 1904 for the 18-pounder and 13-pounder guns for field and horse artillery respectively. In the case of horse and field artillery, which must carry into the field every round which they fire, there is a grave disadvantage in fixed ammunition, in that it compels the carriage of an unnecessary load (the brass cartridge) which amounts to some 12 per cent. of the ammunition carried. If some quicker means of inserting the tube into the vent could be devised, so that the service of the gun was not delayed thereby, there would seem to be small excuse for the retention of the brass cartridge.

To return again to the mountings and appurten-

ances of ordnance. In 1890, in order to reduce the strain due to recoil, the 15-pounder field-mounting in the British service had been provided with a top carriage, on which the gun was allowed a short recoil, controlled by a spring buffer, independent of the ordinary recoil on its wheels of the main bottom carriage. In 1897 the French introduced a field-carriage, in which the independent recoil allowed to the top carriage was greatly increased, while the point (rear) of the trail was fixed into the ground by a sort of spade, which embeds itself after the first round fired and checks all further recoil. Extraordinary steadiness and accuracy, coupled with rapidity, of fire were obtained by this combination. As a consequence, however, of fixing the trail in the ground it was necessary to provide independent traversing of the top carriage, and to this has been added further mechanism whereby the laying of the gun for elevation and for line can be effected independently the one of the other, and these operations be carried out by two men. This still further increases the potential rate of fire. Most of the above refinements are to be found in the field-artillery equipments of the leading powers, including, of course, the British. Fig. 14 shows the British 18-pounder gun, carriage, and limber. The buffer is in the long casing above the gun. It has a hydraulic piston to control recoil, and a spring which is compressed during recoil, and thus runs the gun out to the firing position again.

Since the experience of modern war has shown the necessity for the concealment of field-guns, and it is now generally accepted that guns which come into action in the open against a concealed opposing artillery will be rapidly put out of action, provision is made for a 'dial' sight for

laying guns indirectly from behind cover by means of auxiliary aiming points, while observation of fire is carried out by a small party posted where it can see the target and so control the fire. Portable observing-stations, whereby an observer can be raised some 10 feet from the ground, and so look over a crest or undulation behind which the guns are concealed, have also become parts of ordinary equipment. In addition there are the ordinary sights, usually telescopic, for laying by direct vision, though these sights are no longer fixed to the gun itself. From the preceding it will be seen what a very long way the field-artilleryman of to-day has travelled from the standpoint of 1866, when the very simple Armstrong equipment was regarded as unduly complicated.

Heavy field-guns and howitzers are furnished with most of the niceties of the field-guns, and in the case of howitzers, which are usually mounted to be capable of firing at all angles, from about

5° depression to some 70° of elevation, the complications of the carriage are somewhat increased; and in some cases recoil-gear is provided, whereby the resistance of the recoil-buffer is automatically varied to suit the varying force of recoil due to the different elevations.

Turning now to fortress-artillery, the second breech-loading period (1882 to the present time) has witnessed in an extraordinary degree the adoption of elaborate mechanical appliances in the mountings of guns; of delicate electrical appliances for the transmission from observing-stations to the guns of the ranges of objects to be attacked (the ranges being obtained by range-finders, which are as accurately made as the best astronomical instruments), and of 'automatic' sights (first introduced in 1897), which are so designed that if the gun be correctly aimed it will at the same time be given automatically the requisite elevation needed to carry the projectile to the object aimed

Fig. 14.

at. 'Laying' of guns is almost always done by telescopes, whether with automatic or ordinary sights. One of the most remarkable mechanical complications which had a very special vogue in the British service between the years 1884 and 1890 was the 'disappearing' mounting. It may be remarked that this was an old idea revived, for Moncrieff (q.v.) invented a 'disappearing' (counter-weight) mounting as long ago as 1872. On these mountings the gun is carried on hinged arms, by which it is raised so as to be able to fire over a high parapet. On firing, the gun recoils, the arms are driven by the recoiling gun backwards and downwards, and, at the end of their downward course, the arms and gun are held back. During the recoil the arms push a piston into a cylinder containing liquid and air, compressing the latter. The gun having been loaded in the down-position, a valve is opened and the compressed air, expanding, pushes the piston, and by it the arms and gun into the up-position ready for firing again. A considerable number of these mountings, with heavy guns up to 9.2-inch calibre mounted on them, were provided, and a few still exist on certain sea-fronts. Without doubt they fulfil their purpose, which is to expose both the guns and the men working them to a minimum to hostile fire; but they possess a serious drawback, in addition to that of the necessity for the great care required to keep them in working order, in that they necessarily allow of only a slow rate of fire. It is now considered that the occasions when ships will lie off a fortress and attempt to silence or reduce it by artillery fire will be very rare, since such a proceeding argues command of the sea, which would probably enable the force possessing it to land troops and take the surer course of a land investment; and that the occasions when

fortresses with sea-fronts have to fire on ships will be to prevent them slipping past to attack something the fortresses are intended to protect—say a harbour full of shipping, or some important dock-yard. As a result of this change of view, everything is now done to obtain rapidity of fire, the guns being mounted in barbettes, with armoured shields, but with a clear view, and provided with 'automatic' sights (which are also telescopic) and every possible appliance to ensure rapidity of fire. Abroad the mountings are sometimes covered with 'turtle back' shields of hard iron or steel.

In ships of war the present British practice, which is in the main followed by other powers, is to provide battleships and 1st class armoured cruisers with a light quick-firing equipment for repelling attack by torpedo-boats, and a heavy main armament of 12-inch, 13.5-inch, or 15-inch guns for the attack of other warships. The mountings of these heavy guns are even greater miracles of mechanical and electrical ingenuity than those in fortresses, as are the subsidiary appliances for sighting, passing ranges, and judging and correcting the fire from the guns. There are also elaborate arrangements for passing up ammunition from the magazines. Fig. 15 shows an Armstrong-Whitworth naval 12-pounder quick-firing gun on its mounting, which, it may be added, is very similar to that employed for land service.

The course of artillery development abroad has been very similar to that in Great Britain, and the change from smooth-bores to rifled guns took place very nearly at the same time. Only in one respect has Great Britain taken a different course from that pursued elsewhere, in that she reverted to muzzle-loading after adopting breech-loading. In the early adoption of steel, Germany (that is to say, Krupp) took the lead, paying for it at the start with many

burst guns. In wire-gun construction England is at present peculiar; but there are signs that the method is finding favour elsewhere, notably in the United States.

Generally there is a great similarity in the armaments of all the great powers, whether for sea or

Fig. 15.

land. Fig. 16 shows a Krupp turret-mounting for two 10.9-inch guns, with shield removed, and fig. 17 a 14-pounder Krupp field-gun, carriage, and ammunition-wagon. It will be noticed that this gun is furnished with a 'panorama' sight, which combines the ordinary and dial sights. Fig. 18 shows an 8.2-inch Krupp howitzer, with a self-laying track for moving on soft ground.

The war of 1914-18 has developed no radically new principle in the production of cannon or their mountings, but it has been remarkable for: (1) The enormous increase in the employment of artillery generally, and in the expenditure of ammunition

Fig. 16.

per gun. Prior to it a provision of 2000 rounds per gun for a campaign was considered more than liberal for field-guns, whereas during it a gun often fired this number in the course of a few days. (2) The employment of much heavier guns in the field mounted on mobile mountings, up to 6-inch calibre in the case of guns, and quite normally up to 9.2-inch (with a few 12-inch and 15-inch) in the case of howitzers. This was the practice by all the powers engaged, and with it there was an immense increase of mechanical traction both for the haulage of the guns and ammunition. A few very heavy guns, 9.2-inch and 12-inch, on railway mountings were also provided for special purposes. Owing to the difficulty in concealment from aeroplane observation and the desirability of keeping

guns out of the reach of hostile fire, efforts were universal to obtain the longest possible ranges of which cannon were capable, by increasing the amount of elevation which their mountings could give, and by increasing the length of taper of the points of projectiles to reduce air resistance, and, where the margin of strength of the piece admitted it, increasing the charges fired to give greater muzzle velocities. The object, of course, was to out-range the hostile artillery, so as to inflict damage without suffering it in return. Observation by aeroplane has altered the original practical limitation of range imposed by the extent of vision from the ground necessary to observe and correct

Fig. 17.

the results of fire, and the limit now is practically the extreme to which the guns will carry. An extreme instance of long-range fire was the shelling of Paris, which commenced on the 23d March 1918, by a concealed gun, estimated to be not less than 75 miles away. The essentials to produce such a gun are quite well known, and a good general account of them will be found in 'The Long Range Gun,' a lecture by Major Maitland-Addison, R.A., recorded in vol. xlv., No. 4, of the *Journal of the Royal Artillery*, dated July 1918. (3) The greatly increased use of high-explosive shell instead of shrapnel in field-guns, and the introduction of smoke composition into high-explosive shell to increase the visibility of bursts for observation at long ranges. (4) The introduction of shell filled with smoke composition to produce

Fig. 18.

smoke-screens for protective purposes just prior to attack by infantry. Phosphorus alone is superior to all compositions, but its supply is limited. (5) The introduction of the 'Tank' (a special form of armoured car armed with two light guns) for the attack especially of machine-guns in entrenched positions protected also by wide belts of barbed wire. (6) The introduction of a vast and varied armament for trench warfare (see BOMBS). (7) The introduction of poisonous gases in shell and

bombs, and ejected from cylinders for carriage by wind, and the necessary provision of masks for the protection, more or less efficient (latterly less), of the soldier against this odious weapon, which was Germany's special contribution to the horrors of war. (8) The armament of aircraft with machine-guns for war in the air (though in the later stages of the war aeroplanes regularly fought against troops on the ground), and bombs for attack of objectives both on land and sea. (9) Anti-aircraft armaments, differing only from ordinary quick-firing armaments in the provision of facilities for elevation of the guns to all angles up to the vertical, and special sights to enable rapidly moving objectives to be followed easily anywhere in the field of view. These weapons were often mounted upon platforms propelled by motors for rapid transit, but, for defence of towns, were bolted down to foundations in certain suitable localities. Their projectile was a high-explosive common shell with time or time and percussion fuse, the burst being, however, generally brought about by time action, and exclusively so in the case of the regular defence of towns to prevent a shell, which has failed to burst in the air, from bursting on reaching the ground or striking a house.

Speaking broadly, developments (1) to (7) above were the results of the immense power of resistance of good troops, on the defensive in well-entrenched and well-wired positions, and armed with modern weapons, especially machine-guns. Without the employment of every available means to shake the defender and to protect the attacker, the losses of the latter, even if ultimately victorious, are so prodigious as to be prohibitive unless the defender be not merely forced to retreat, but absolutely routed without hope of reforming for resistance farther back. Even with every assistance at command, the attack must always be very costly. On the whole, it can be said that the above-mentioned developments attained the objects expected; but, as to (8) and (9), while the armament of aircraft (meaning thereby aeroplanes in the main, as airships were latterly used almost entirely for observation, out of proximity to the fighting-line, whether by land or sea, owing to their vulnerability) was quite efficient, it cannot be said that anti-aircraft armaments ever became serious deterrents of aeroplane approach, whether for purposes of observation or attack. Until, by day, the act of obtaining the range of an aeroplane by means of a range-finder (which *can* be done) can be translated automatically and instantly into the correct elevation of the gun and the correct setting of the fuse, and the process becomes as comparatively simple as the aiming of a gun by the ordinary automatic sight supplied to fortress guns well elevated above sea-fronts, it is difficult to see how thorough efficiency can be obtained. On *paper* the solution is quite attainable, but in practice the complications are very great, though probably not prohibitive, except on the score of cost and liability to derangement. It must be remembered in this connection that there is no necessary co-relation between the angle to which a gun must be elevated in order to be aimed at an object in the air and the range of the latter, nor between the height above the ground of the object and its range. When we come to attacks by night by aeroplanes, usually very high up and very difficult to follow by searchlight, the problem becomes still more difficult, and the only possible defence by artillery would seem to be by the 'barrage' of shell burst by time-fuse at different heights in the path which it is hoped the aeroplanes will take. This defence, besides demanding an enormous expenditure of ammunition, has been proved to be inefficient, and does no more than keep the attackers at great altitudes, and so renders

success in bombing definite objectives so extremely difficult of attainment as to be purely a matter of chance. It is needless to add that the possibilities of locating aeroplanes at night by sound have been, and are being, exploited, while the suggestions of special shell to destroy them have been innumerable, though hitherto none have been of sufficient value to displace the high-explosive common shell.

Broadly speaking, no nation can ever have anything more than a temporary advantage—due to early initiative—in the quality of its war-stores, though undoubtedly it may have in its power of production in quantity. Guns, mountings, and projectiles are the productions of the designer, the metallurgist, and the engineer, and explosives of the chemist. There is no mystery in the matter, and no monopoly of the skilled professions mentioned is possessed by any nation; and it follows that, once it is known that a nation has a war-store giving certain results, those results can soon be copied in spite of all attempts at secrecy. Similarly, the same limitations to advance usually hold universally. Since the general introduction of smokeless powders (about 1890) the tendency has been to take full advantage of the higher velocities obtainable with them, and to obtain the requisite projectile-energy with guns of smaller calibre, with much higher velocities; and a present limitation is the inability of steel to withstand for an adequate time the tremendous erosion, if high velocities be obtained, using any propellant known at present. This applies especially to the heavy guns, as erosion is largely due to heat, and increases with the weight of charge, and in them the limit of velocity seems at present to have been reached at about 2900 feet per second. In smaller guns erosion is not so bad, and higher velocities might be obtainable; but in these there are other reasons for not exceeding a somewhat similar velocity, even when they are mounted on fixed mountings. In field-guns, whether light or heavy, the velocities are purposely kept as low as possible consistently with obtaining adequate range, owing to the difficulties in checking recoil.

Trustworthy official figures are not available for the latest guns in use by *any* of the great powers, and the table given below is *general*; that is, it may be taken that guns of the *latest* construction in use by any power, of calibres the same (or nearly the same) as those mentioned, will fire projectiles not materially heavier, with velocities not materially greater, than those mentioned. Where velocities much exceeding those given are claimed, without a considerable reduction in the weight of the projectile (below that given in the table for the particular calibre in question) being also admitted, the statement should be regarded with suspicion, as either mistaken or as representing as normal results obtained exceptionally. Velocities of close on 4000 feet per second have been obtained, using projectiles which are abnormally light for the calibre, and velocities with projectiles of normal weight up to 3200 feet per second are frequently obtained in proof of guns; but neither of these represent service conditions. The object of heavy guns is to strike heavy blows, with projectiles containing adequate bursting-charges up to the extreme range to which the gun will carry; of *all* guns to carry projectiles with as heavy bursting-charges (or content of bullets in the case of shrapnel) as the conditions will permit; and it is difficult to conceive circumstances in which it would be worth sacrificing weight of projectile in order to attain velocity (see the article on Rifles as to the relation of weight to diameter in projectiles, which applies to cannon also). The modern tendency is somewhat in the contrary direction—i.e. to increase calibres and weights of projectile, and decrease velocities and so avoid erosion; and in this the United States took

the lead. See also SHELL, SHOT, CARTRIDGE, BREACH-LOADING, and FUSE.

N.B.—It will frequently be found that the velocities habitually used are much lower than those given in the table for naval and fortress guns, as the latter represent approximately the highest practically obtainable, *not necessarily those actually used.* With field-guns (both light and heavy) and with howitzers the velocities are always much lower than might be used if recoil troubles had not to be considered.

‡ With field and mountain guns a lower velocity does not necessarily correspond with a larger shell.

† In two parts, each not exceeding 250 lb. in weight, so as to form a suitable mule-load.

Cannon, JOSEPH GURNEY, wielder of great power as Speaker of the House of Representatives in the 58th, 59th, 60th, and 61st Congresses of the United States (1903–11), was born 7th May 1836 at Guilford, North Carolina. He was admitted to the Illinois bar in 1858. From 1873 (with short intervals) he has represented Illinois districts as a republican.

Cannon-ball Tree (*Couroupita guianensis*), a large tree of Guiana, one of the Lecythidaceæ, bearing a large and fragrant woody fruit.

Cannon Bone. See FOOT, HORSE.

Cannstatt, in Württemberg, was in 1904 incorporated with Stuttgart.

Cannula, a small tube used in surgery; especially a tube enclosing a *trocár*, or perforator (withdrawn after it has effected the introduction of the tube), used for evacuating air or fluid from any cavity in the body; and the tube for the patient to breathe through, inserted into the windpipe after the operation of Tracheotomy (q.v.).

Cano, ALONSO, a Spanish painter, born at Granada in 1601, received his first instructions in the principles of art from his father, who was an

architect, and attained celebrity so early that in 1638 or 1639 he was appointed court painter and architect to the king. Cano was of a hasty temper, and was accused of having murdered his wife in a fit of jealousy, but the accusation appears to have been quite groundless. He was subjected to the torture; but no confession having been elicited, he was acquitted, and received again into the royal favour, named residentiary of Granada, and spent his last years in acts of devotion and charity. He died 3d October 1667. In Fuseli's opinion, he excelled all his contemporaries except Velasquez. His eminence in the three departments of the fine arts—sculpture, painting, and architecture—obtained for him the hyperbolic title of the 'Spanish Michelangelo.' His pictures, marked by graceful design and pleasing colouring, are very numerous, and are preserved in Granada, Seville, Madrid, Málaga, and other Spanish cities.

Cano, JUAN SEBASTIÁN DEL, the first circumnavigator, was born at Guetaria, on the Bay of Biscay. In 1519 he sailed with Magellan (q.v.), and, after his death, safely navigated the *Victoria* home to Spain, 6th September 1522. He died in a second expedition, 4th August 1526.

Cano, LEOPOLDO, Spanish dramatic poet, was born at Valladolid in 1844.

Cano, MELCHOR, Spanish Dominican theologian, was professor at Salamanca, attended the Council of Trent, opposed the Jesuits and the papal power in Spain, and was consecrated Bishop of the Canaries. He died in 1560. His most famous book is *De Locis Theologicis* (1563).

Canobus. See CANOPUS, ABOUKIR.

Canoe (from a Caribbean word through the Span. *canoa*), originally, a light narrow boat, made of the hollowed stem of a tree or of bark, and propelled by paddles. The Neolithic canoes of Britain and many of those in use among primitive peoples to-day are 'dug-outs,' being simply stems of trees hollowed by stone implements, shells, or fire, and then shaped, and often sharpened at either end. The Canadian birch-bark canoe is a light, buoyant, frail-looking, but serviceable boat.

In building it a skeleton is made of light wood, the casing of birch-bark is put on transversely, with the broadest strips amidships, and sewn together with the fibrous roots of fir-trees, while the seams are dressed with gum. It has no keel, and neither stem nor stern, but runs to a point at each end; and neither nails nor pegs are used in its construction. The outer skin of the 'Canadian' canoes, so popular on the Thames, is made of alternate strips of light and dark hard-grained woods, $\frac{1}{4}$ inch thick, grooved, bound, and glued together; a layer of broader strips, placed crosswise, forms the inner skin. The timber used is steamed and bent when moist on to a mould the exact size of the proposed canoe. The birch-bark canoes of South America and the Australian gum-tree bark canoe are made of one piece of bark. For Eskimo Kayak, see ESKIMO. Many of the Polynesian canoes are hollowed out of a single log; others are of planks cunningly fastened together, and fitted with outriggers. The

Canadian Trapper's Canoe.

largest Fiji canoes are 100 feet long, and the double ones—with deck placed between them—of 70 feet can carry from 40 to 50 persons. Those of the Solomon Islands have a palette-shaped sail made of a mat. On the inland African lakes some are made of reeds. See CATAMARAN, CORACLE, PROA, &c. Modern British canoes are usually constructed of oak, cedar, or pine. The revival of British canoeing is due to the achievements of John MacGregor, whose *Rob Roy* canoe for navigating eastern waters was 14 feet long, 26 inches wide, with a 7-foot paddle; and its weight, including paddles, masts, and sails, was 72 lb. It was of oak below, decked with cedar, and had an apron of white waterproof. A few years later Tredwen and Baden-Powell's *Pearl* and *Nautilus* canoes had both the head of the boat raised and its shoulder broadened; and the modern cruising canoes are on an average 15 feet long, with a 30-inch beam; they are mostly fitted with two larger sails, and, with a metal centre-board and deep rudder, can sail as close to the wind, when tacking, as a yacht. American inventors passed from the stationary deck seat (1882) to the sliding seat (1886), and from various elaborations in reefing and lowering sails to standing sails that cannot be lowered or reefed; the cockpit was even reduced to a mere depression in the deck 6 inches deep. The modern canoe, in spite of its great sail area, will ride out open boats many times its size.

See MacGregor, *A Thousand Miles in the Rob Roy Canoe*, and *Rob Roy on the Baltic, Jordan, and Zuyder Zee*; Baden-Powell, *Canoe Travelling* (1871); Inwards, *Cruise of the Ringleader*; R. L. Stevenson, *Inland Voyage*; Holding, *Cruise of the Osprey* (1878) and *Watery Wanderings* (1886); Vaux, *Canoe Handling* (N.Y. 1888); Stephens, *Canoe and Boat Building* (N.Y. 1891); Canoeing and Camping Out (London, 1893); J. D. Hayward, *Canoeing with Sail and Paddle* (1890-93).

Canon, a word originally Greek (*kanōn*), signifying a straight staff used as a measuring-rod, is applied in various arts and sciences to what serves for a rule or standard. From this general sense, which it bears, e.g., in Galatians, vi. 16, the word by the middle of the 3d century had come to mean the type of Christian doctrine recognised as orthodox by the Catholic Church, and afterwards was particularly employed to designate collectively the Scriptures which were accepted by the Christian church as the standard or rule of faith. The first instances of the latter meaning are found in the 59th canon of the Council of Laodicea (363 A.D.), and in the *Epistola festalis* of Athanasius. A book accepted by the church into the canon is accordingly canonical; and its canonicity is the complex of the very various qualities which have led the Christian churches so to accept it. The canon of the Old and New Testaments is discussed at BIBLE (and cf. APOCRYPHA). The word canon is also sometimes used to signify a list (e.g. that of the clergy at the Council of Nicæa in 325), and in this sense it is still used to denote the catalogue or register of Catholic saints. The use of the plural form to denote church precepts occurs about 300, and it begins to be specially transferred to the decrees of church councils about the middle of the 4th century (see CANON LAW). The Canon of the Mass (see LITURGY) is the portion included between the Preface and the Pater, the rule for the eucharist in the Roman Catholic Church, and including the prayer of consecration and the words whose use is believed to alter the bread and wine into the veritable body of Christ. For the Apostolic Canons, see APOSTOLIC CONSTITUTIONS; for the Canons of the Church of England, see under that head; for those introduced into the Scottish Church in 1635, see CANONS (BOOK OF).

Canon (Lat. *canonicus*), an ecclesiastical dignitary (so called as living under a rule, or as following the rule or canon of divine service, or again, most probably, as inscribed on the canon or roll of ecclesiastical officers) holding a prebend in a cathedral or collegiate church. His office is of no great antiquity. According to Pasquier, canons are mainly divided into Canons Regular and Canons Secular. This, however, is not precisely true, for the term canon was applied in the 4th century to cenobites living under a common rule; and the office of canon is supposed by some antiquaries to have been introduced by Baudin or Baldwin, Archbishop of Tours (546-52) under Clothaire I., but was more probably first instituted by Chrodegand, or Chrodegang, Bishop of Metz, in 763. It is at least certain that he was the author of the oldest canonical rule, which was simply an adaptation of the monastic rule commonly but erroneously attributed to St Augustine, to the priests and 'clerks' specially attached to the service of a cathedral or other church, but differing therefrom chiefly by omitting the vow of poverty, and allowing canons to retain a life-interest in private property. It enjoined on the canons manual labour, the practice of silence at certain times, confession twice a year, and other duties needless to specify. The canons formed the council of the bishop, and assisted him in the government of his diocese. They lived in a house called a monastery, slept in a common room, ate at the same table, and were originally supported out of the episcopal revenues. This institute was encouraged by Charlemagne, under whom provisions concerning it were enacted at the Councils of Aix-la-Chapelle in 788, and Mentz in 813. In 816 Louis the Pious induced the Council of Aix-la-Chapelle to draw up a general rule of 147 articles for the whole body of canons. Canons found their way not long afterwards into England, Scotland, and Ireland. Various reforms of canons were made in the 11th and beginning of the 12th century, notably the institution for the canons regular of rules for community of life and abolition of private property imposed by Pope Nicolas II. in 1059, and by Alexander II. in 1063, and the foundation of the Austin canons by Gervase, Archbishop of Rheims, in 1067, followed up by Ivo, Bishop of Chartres (1090-1115). Although the so-called rule of St Augustine was adopted in various places, it was not till 1139 that Innocent II. decreed, and the Council of Lateran, that all canons regular should be bound by that rule, and from that time they took generally the title of canons regular of St Augustine, or Austin Canons (see AUGUSTINIANS). They were further dealt with in a reform enforced by a bull of Benedict XII. in 1339. Gradually, however, many began to emancipate themselves from the restrictions of monastic life, and to live independent of any rule, which is not at all surprising, for the canons were wont to keep apart from the 'lower clergy,' as they called parish priests and others who really laboured to impart religious instruction. They were often of noble families, loved titles—at Lyons, one of the 'noble chapters,' every member of which had to prove several descents of nobility in the case of both his parents, they were called *counts*—and in general were men of the world rather than true churchmen. Most of these reformed or remodelled canons were called Black Canons, from wearing a black cassock; others, White Canons, from wearing a white habit, like the *Premonstratenses* of Picardy in France, and the canons of St Victor at Paris and Marseilles. In England, while there is some ground for holding that the clergy established by Augustine at the church of Canterbury were rather canons regular than monks, there is no positive evidence of the

introduction of canons regular till the beginning of the 12th century, when they appear at Gloucester, and somewhat later in London. They were reformed by Cardinal Wolsey in 1519, in virtue of a bull of Leo X., but shared in the general fall of monastic institutions in 1539. The class of *secular* canons, whose manner of life was not conventional, and who therefore escaped destruction in England when the monasteries were abolished by Henry VIII., probably originated in a tendency to relax the severity of rule enjoined on the regulars, which indeed was hardly less stringent than in the case of ordinary monks. Secular canons still exist in the Anglican Church, and their duties—making allowance for the difference between the Roman Catholic and Anglican religions—are much the same in kind as they were before the Reformation. For Minor Canons, see CATHEDRAL.

Canon, in Music (from the Gr. *kanōn*, 'a rule'), is the species of Imitation (q.v.) most strictly according to rule. The melody given out by one part is repeated note for note by the successive parts which follow at any interval of time and position in the scale. When produced between two parts it is called 'two in one,' when between three, 'three in one,' at the octave, fifth, or any other interval. Two or more canons may be carried on simultaneously; a piece for eight parts, consisting of four canons each between two voices heard simultaneously, is termed a canon 'eight in four.' Other parts may be heard, not in imitation, along with those in canon. The imitation may also be made by means of the devices of inversion, diminution, augmentation, retrogression, &c. The latter is termed a canon 'cancrizans,' from its crab-like motion. When a canon terminates by a few notes not in imitation, forming a cadence, it is called finite; but when it returns again to the commencement it becomes 'circular,' or 'infinite.' Canons are found in both instrumental and vocal works, and composers of all ages have shown their skill in constructing them. They abound in the works of the older writers, and occasionally considerable works were constructed wholly in canon—e.g. a Mass by Alessandro Scarlatti. Frequently they were more curious and enigmatical than beautiful; in modern music they appear in their proper aspect as incidental, or as merely an ingenious play upon notes. Byrd's well-known *Non nobis Domine* may be referred to as a specimen of canon. A full treatment of the subject will be found in the works upon counterpoint and fugue by Marpurg, Cherubini, or Ouseley.

Cañon (sometimes spelt *canyon*; Span. 'a cannon, 'tube,' 'gorge'), the name given in western North America to a deep gorge or river ravine, between high precipitous cliffs. One of the best examples is the far-famed cañon of the Colorado (q.v.); see also SNAKE RIVER.

Canoness (*canonica*). The title of canoness was given at the close of the 8th century to a class of women living in common under a somewhat laxer rule than that of nuns, and originating in the Frank empire in imitation of the chapters of canons then recently instituted. They took the vows of chastity and obedience, but not that of poverty, and were not cloistered, though they had a common table and dormitory, and were bound to the recitation of the breviary, as were nuns. Their occupations were chiefly education of girls, transcription and embellishment of church office-books, and embroidery of vestments. The advantages of such institutions as asylums in a rough age were soon visible, and they multiplied in consequence, but as in many houses the religious motive had little to do with entrance, a distinction was drawn ere long between canonesses

regular and secular. The secular canonesses were for the most part members of princely or noble families, practised much state and luxury, and retained none of the rule save the common dormitory and the recitation of the Hours in choir. In Germany, several abbesses of canonesses were princesses of the empire, kept up feudal state, and furnished contingents to the imperial army from their vassals; and at the Reformation some chapters adopted the new opinions, and subsist to the present day as Protestant foundations, enjoying the revenues, and admitting to membership only ladies of noble birth or daughters of distinguished members of the military and civil services, whose sole obligation is celibacy during membership.

Canonical Hours are the hours of day and night fixed for the reciting or chanting of the several parts of the divine office in the Church of Rome, but they are no longer strictly adhered to except in certain monastic orders. See BREVIARY. In England the phrase is also used for those hours (now 8 A.M. to 3 P.M.) in which a marriage can be performed in a parish church.

Canonicals, a term used to describe the proper ecclesiastical dress of the clergy. See VESTMENTS.

Canonisation in the Roman Catholic Church is a solemn act by which the pope publicly proclaims the sanctity of a servant of God, whom he thereupon proposes to the veneration and *cultus* of the universal church. As a rule it is the final act of a lengthy juridical process, of which a former stage has been completed by the decree of Beatification (q.v.). To obtain this preliminary honour, the reputed saint must pass a strict examination of his virtues, and give proof of his performance of miracles. The decree of beatification declares him to be among the citizens of heaven, and accords him the title of Blessed, but the *cultus*, including the celebration of his feast-day, proper offices in missal and breviary, and the public veneration of his image or relics, is permitted only in a specified country, diocese, or religious order. Canonisation, which follows only on evidence being produced of fresh miracles performed by the *Beatus*, gives him the full title of Saint, and enjoins his *cultus* upon the whole church.

This formal grant of a heavenly rank and dignity to a deceased person has an analogy with the *Apotheosis* (q.v.) of ancient Rome. In the primitive Christian church the germs of the modern custom are to be found in the honours publicly paid to the martyrs. Altars were set up at their tombs, the anniversaries of their triumphs were celebrated with religious rites, and their names commemorated in the liturgy. Similar honours came shortly to be bestowed on the confessors or those who suffered imprisonment or pains short of actual martyrdom for their faith; and finally, when the days of persecution were over, the status of a confessor and the title of saint were extended to all who died with a reputation for eminent sanctity or for the working of miracles, which was taken as an almost infallible token of sanctity. For many centuries the appellation of saint was given to individuals, as it were, by popular acclamation. Martyrologies, menologies, calendars, and the like, were composed, which gave with more or less discernment and authority the names of the generally acknowledged saints, while it would fall to the bishop to decide to whom he should assign a feast-day or ritual commemoration within the limits of his own jurisdiction. Grave mistakes were admittedly made. Thus, St Martin of Tours is said to have miraculously discovered that a pretended martyr much honoured in his diocese, and over whose tomb the bishop had erected an altar, was no other than a

robber executed for his crimes. Legendary 'acts,' migrating from country to country, were a frequent source of confusion, a curious instance of which may be found in the story of Barlaam and Josaphat (q.v.), which has procured a place in the Roman martyrology for the pious memory of Buddha.

It was not until a comparatively late period that a regular form of procedure equivalent to canonisation was adopted. Application had, indeed, in early times been made to Rome for sanction of the cultus of some holy person, as in the case of Vigilius, Bishop of Trent, said to have been martyred in the first decade of the 5th century. But the earliest acknowledged instance of a solemn decree of canonisation is that of Udalric or Ulric, Bishop of Augsburg, declared to be a saint by John XVI. in 993 A.D. A little short of two hundred years later (1170 A.D.) Alexander III. reserved the right of canonising exclusively to the Holy See, and made it unlawful to render public cultus to any person, however celebrated for miracles, without the sanction of the pope. There had apparently been some ground for the decree; for in the pontificate of this same Alexander, the monks of a certain convent had publicly venerated as a saint a member of their community, who, in a fit of drunkenness, had been beaten to death by his religious brethren. The new rules were, however, not strictly observed, and abuses continued. Urban VIII., in two constitutions, 1625 and 1634, made more stringent regulations, and laid down the procedure in cases of canonisation, which, with slight modifications, is in force at the present day. It was strictly forbidden to give any public honour whatever to a reputed saint, to exhibit his picture in church, or even to apply to such a one the title of 'saint,' without explanation. The pope, however, declared that he did not thereby intend to prejudice the case of those who had received immemorial cultus through the general consent of the church, or whose cultus had obtained any special sanction from his predecessors. The exception is important.

Canonisation, without a special dispensation, cannot be decreed until fifty years have elapsed since the decease of the claimant for the honour. The process which precedes the decree observes all the forms of a suit at law. Two things must be established by competent witnesses—eminent virtues, technically called virtues in an 'heroic degree,' and the performance of miracles. The virtues, however heroic, will not be enough without miracles, and the miracles, however numerous and extraordinary, will not suffice without heroic virtue. In the case of the martyrs only, the requirements under the head of virtue are naturally less rigorous, all that is needed being proof of certain dispositions regarded as a proper preparation for true martyrdom. The first step is taken in the country or diocese of the servant of God by the ordinary, who sets up his court and examines witnesses, who speak, not now of virtues in particular, nor in proof of definite miracles, but of the existence of *fama*, or a reputation for sanctity. The bishop, or his vicar-general with assessors, sits as judge. The postulator selects and summons the witnesses in favour of the cause. An official corresponding to the *promotor fidei*, or the 'devil's advocate,' at Rome, watches the case to see that all the forms of the law are strictly observed, and a notary takes down the evidence, which, with all the documents 'compulsed' or put into court, is transmitted to Rome, to be there laid before the Congregation of Rites, whose business it is to sift and examine the evidence; and finally, but not until the expiration of ten years, report to the pope.

It is not necessary to describe the several stages

through which the process is conducted. If the promoter of the faith is satisfied, the pope takes the cause into his own hands, issues remissorial letters to a committee of the Congregation of Rites, which will then have to examine the virtues and miracles specifically. The cause is now said to be 'introduced.' So far the juridical decision is equivalent to the finding of a grand jury that there is ground for sending the case to trial. The introduction of the cause—i.e. of the pontifical process, entitles the *beatificandus* to be called Venerable. Very many have attained to this point in the proceedings, and no further. The legal expenses are considerable; and apart from the merits of the candidate, the motive power, such as the patronage of princes or the influence of a powerful religious order, is often wanting. If, however, the candidate passes successfully through the ordeal of the pontifical process, a decree of beatification is pronounced, and a festival-day, with proper office and the annexed privileges, is conceded to a specified locality or community, beyond which the cultus must on no account be extended. Before the further process of canonisation can be instituted, as has been said, the *beatus* must have worked a certain number of miracles since his beatification, and if these are such as can be brought into court, the case once more passes through the hands of several congregations, the last of which is held in presence of the pope, when the final decree is drawn up and agreed upon.

The ceremony of canonisation takes place in the Vatican basilica, and is one of the most solemn and imposing of all papal functions. It opens with a grand procession of pope and cardinals, with the image of the saint borne on banners. The pope then takes his seat on the throne, surrounded with his court. The postulator of the cause, generally a person of high rank, is led to the steps of the throne, and there petitions that the blessed servant of God may be enrolled in the catalogue of saints. The pope replies that so grave a matter requires light and counsel from heaven. The litanies are thereupon chanted, and the demand of the postulator renewed. Again the pope requires to ascertain the will of God by prayer, and the *Veni Creator* is sung. After a third request the pope announces that the *beatus* is enrolled in the canon of the saints, and that his memory is to be celebrated on a certain day throughout the church. Other ceremonies follow, with a high mass, at which the pope officiates, and at which the several cardinals concerned present mystical offerings, ornamented candles of wax, turtle doves and other live birds in gold and silver cages, costly flagons of wine, &c.

It must not be supposed that these lengthy juridical proceedings and ceremonies take place on all occasions of papal canonisation. For, besides what is called the formal canonisation, there is another process called equipollent or equivalent canonisation. This is founded upon the before-mentioned exceptions of Urban VIII.—i.e. upon proof of immemorial cultus, or of some papal sanction given to cultus prior to the date of Urban's constitution. In such cases the pope may at once pronounce the decree. Equipollent beatification is a summary process of a similar kind. The pope accepts the results of the ordinary process, and at once decrees beatification.

Equipollent beatification and the earlier stages of the process may be illustrated by the case of the English martyrs of the 16th and 17th centuries, which possesses some interest as being the first instance of the introduction of a cause relating to any English-speaking person since the Reformation. On 19th June 1874 Cardinal Manning instituted the ordinary process in due form. He

delegated three judges, who held their sessions at the London Oratory. Father Morris, S.J., acted as postulator, and summoned Bishop Hedley, Father Stevenson, the Duke of Norfolk, and others, as historical experts, to give evidence on oath in answer to written interrogatories. They testified to the cause of martyrdom, the character of the martyrs, and the tradition of miracles wrought at their intercession or by touch of their relics. There is no cross-examination, nor are unfavourable witnesses called. The proceedings, with extracts from books and MSS., were carried to Rome, where for more than the requisite ten years the case remained to be slowly digested by the officials of the Congregation of Rites. The promoter of the faith made the usual objections, found that such a one had died a natural death in prison, or that religion could not be said to be the cause of the execution of another. Meanwhile attempts were made by the postulators to escape from the difficulties of the tedious process before them, by finding ground upon which the pope could by indult grant equipollent beatification. Such a ground was at last discovered in the pictures of the martyrs under Henry VIII. and Elizabeth, painted on the walls of the English College at Rome in 1582, by sanction of Gregory XIII., and thereby giving proof of papal authority for public veneration of these martyrs. The 'devil's advocate' was satisfied, and accordingly the fifty-four martyrs here represented were declared Blessed in a decree issued December 29, 1886. The cause of 261 was 'introduced,' and these are therefore entitled to be styled Venerable Servants of God. Against thirty-three whose names were sent up to Rome by Cardinal Manning, including Henry Garnet the Jesuit, the objections of the promoter so far prevailed that their cause was deferred.

The case affords a curious illustration of the weak points in the procedure. The list of these English martyrs transmitted to Rome in the first instance followed that of the cautious Bishop Challoner, and therefore excluded many doubtful claimants who had appeared in some earlier and less authentic catalogues. Little was known, for example, of the priest Plumtree, who acted as chaplain for the northern earls in the rising of 1569, and was hanged as a rebel at Durham. Few writers ventured to reckon him as a martyr for religion. But his execution was represented in Circiniani's pictures, and therefore, notwithstanding the lack of historical evidence or even of continued tradition, he becomes suddenly, on the strength of this papal privilege, without proof of miracles, promoted *per saltum* to the full honours of beatification.

It remains to be said that Roman theologians commonly hold the decree of canonisation to be infallible, on the ground that otherwise the church might hold up to the veneration and imitation of the faithful a lost soul. It is said to be more doubtful if beatification is also infallible, for although the decree publicly declares the deceased person to be among the blessed, his cultus is permitted rather than enjoined, and that not for the universal church, but, as has been said, for a limited district or community.

The chief authority on canonisation is the great work of Cardinal Lambertini, afterwards Benedict XIV., whose three folio volumes, *De Beatificatione et Canonizatione Sanctorum*, are a storehouse of information not only on the legal procedure, but on the phenomena of ecstasies, visions, raptures, bilocations, and the miraculous healing of the sick and raising of the dead. A good summary of the subject may be read in Ferraris' *Prompta Bibliotheca* (article *Cultus*

Sanctorum). A portion of Benedict XIV.'s treatise relating to *Heroic Virtue* was translated in 1850 into English under that title by the Fathers of the Oratory. See SAINT.

Canon Law (*jus canonicum*) is, strictly speaking, that part only of ecclesiastical legislation in and by synods of spiritual persons which is concerned with the moral and disciplinary government of the Christian church, and is embodied in the form of *canons* or rules. It is thus distinct alike from the dogmatic decisions of similar synods, embodied in *decrees*, affecting formularies and standards of doctrine; from papal law (*jus pontificium*); and from enactments of the civil power upon ecclesiastical subjects (*jus ecclesiasticum*), though the last often overlaps the canon law proper. The earliest example of the enactment of such laws is in Acts, xv. 6-29, when the council of apostles and elders at Jerusalem framed rules of discipline for the new Gentile converts. It was not until the conversion of the empire, however, that it was feasible for canons of synods to have more than local currency and merely consensual force. From that time two new factors enter into the evolution of canon law—the general councils, which either themselves enact canons to bind all Christendom, or give their sanction to those enacted by local synods, thereby similarly extending their scope; and the sanction of the civil power, validating church canons so as to give them legal force and coercive authority.

Canon Law is broadly divided into Eastern and Western. The canon law of the Eastern Church is a comparatively brief code, composed exclusively of few, homogeneous, ancient, and authentic materials, and has remained unaffected by change or accretion for a thousand years. It consists of the following matters: (1) The disciplinary canons of the seven councils recognised as œcumenical by the Græco-Russian Church—namely, Nice I., Constantinople I., Ephesus, Chalcedon, Constantinople II. and III., Quinisext in Trullo (accounted by the Easterns as supplementary to the fifth and sixth œcumenical councils, and therefore not separately reckoned), and Nice II.; (2) the ancient code of laws known as 'Apostolical Canons'; (3) the canons of various lesser synods, Eastern and African, accepted and sanctioned by one or other of the greater synods; (4) canons promulgated by Dionysius and Peter of Alexandria, Gregory Thaumaturgus, Athanasius, Basil the Great, Gregory of Nyssa, Theophilus and Cyril of Alexandria, and canonical epistles of Gennadius and Tarasius of Constantinople; (5) the comments and glosses thereupon of the 12th-century canonists Theodore Balsamon, Joannes Zonaras, and Alexius Aristenus, which, though not properly part of the body of law, have been usually treated as authoritative interpretations. The earliest attempt at codifying the Eastern laws (there were various partial collections made previously) was the *Syntagma Canonum* or *Nomocanon*, compiled in the 6th century by John the Scholastic; the final one was the *Nomocanon* of Photius, patriarch of Constantinople, compiled about 880 A.D. All the main documents of this Eastern code are to be found in the *Synodikon* or *Pandectæ* of Bishop Beveridge (2 vols. folio, Oxford, 1672-82). The civil validation of the Eastern canon law was first effected by Novel cxxxi. of the emperor Justinian.

The Western canon law is of much greater extent, is composed of much more diversified materials, inclusive of a large element of papal law, and has undergone continual changes by means of successive accretions and interpolations, many of the latter being spurious, besides being further complicated by the codes of canons enacted by national churches, and having local currency

only, but co-ordinate with the main Latin code in the several territories within which they are or were in use.

The earliest full collection of canons received in the West was made almost contemporaneously with the earliest Eastern one, and is due to Dionysius Exiguus, a Scythian monk of the 6th century, who translated the Greek portion of his materials into Latin, and issued (*circa* 550 A.D.) the whole in a body of 401 canons, being those of the Apostles, Nice I., Ancyra, Neocesarea, Gangra, Antioch, Laodicea, Constantinople I., and Chalcedon, the so-called canons of Sardica, and the African code of 138 canons. To these he added further all the decretal epistles of popes with which he was acquainted, beginning with Siricius in 385, and ending with Anastasius II. in 496, thus discrediting in advance the long subsequent forgery of the False Decretals, which professedly went back much earlier. This collection was adopted at Rome, and received there its first accretions in the decretals of popes later than the time of Dionysius, down to Gregory II. (715-31). It was this co-ordination of papal epistles and rescripts with the canons of councils, as holding equal rank and authority, which was the distinguishing feature of the compilation by Dionysius, thus winning it that acceptance at Rome which was never accorded to the nearly simultaneous *Breviatum Canonum* by Ferandus of Carthage (547). In its augmented shape, the Dionysian collection was formally recognised as the canon law of the Roman Church, and not merely was tacitly received as such in Western Europe and in Africa, but was sent officially by Pope Hadrian I. to Charlemagne, and solemnly received by the great synod of Aix-la-Chapelle in 803, whence it bore for a time the name of *Codex Hadrianus*. It was similarly recommended to the English bishops by Leo IV. about forty years later. Its fortunes in Spain were even more noticeable and momentous. Adopted there by (or at least in the time of) Isidore of Seville, and published under his name, it speedily supplanted an earlier collection by Martin of Braga, and prepared the way for the great forgery known as the False Decretals, possibly fabricated in Western Gaul, but published in Spain about 845 by Isidore Mercator, and easily passing, through the coincidence of editorial name, into the earlier and genuine Isidorian code. These false decretals consist of about one hundred spurious documents, inclusive of alleged papal rescripts, from Clement I. in the 1st century, to Sylvester in the 4th, and containing also the pretended Donation of Constantine. Nicolas I., then pope, saw how advantageous to himself this testimony must prove, and hastened to give it recognition, causing it to be embodied in the body of Roman canon law, wherein (despite the universal modern admission of its spuriousness) it continues to form a large and influential factor. The simple fact that search in the Roman archives must at once have established the non-existence of the whole collection, brands Nicolas with acting in conscious bad faith, whereas it is possible that the other persons then concerned in giving circulation to it may have been more or less honestly deceived.

The next important stage in the evolution of the canon law was the *Decretum* of Burchard of Worms in 1025, after which came the collections of Anselm of Lucca and Cardinal Deusdedit, about 1086, much increasing the papal factor. Soon followed the collection made by Ivo, Bishop of Chartres, about 1114. He seems to have taken the earlier work of Burchard of Worms, largely citing the False Decretals, and long current in Germany, as his model and guide, for his *Decretum* follows its method closely, and often

adopts its very words. All these collections, however, had one common defect as legal codes. The canons they contained, passed by councils widely apart in time, place, and circumstances, were often conflicting and contradictory, and thus perplexing rather than instructing those who consulted them for practical guidance. To meet this difficulty, Gratian, a Benedictine monk of Italian birth, and professed in a monastery at Bologna, compiled, between 1139 and 1142, a *Concordia discordantium Canonum*, published at Rome in 1144, for the purpose of showing how the opposing provisions could be reconciled; and this work (commonly cited as the *Decretum Gratiani*) met with immediate success, and exercised a powerful influence on the interpretation of the canon law. He appears to have taken the idea from the Pandects of Justinian, then recently discovered, and brought his collection down from the time of Constantine the Great to the pontificate of his contemporary, Pope Eugenius III., who approved it, and is alleged (but on insufficient evidence) to have at once licensed it to be read in the law-schools, and accepted as authoritative. Whether it obtained this special sanction or not, at any rate it did make its way into the law-schools, and enjoyed a dominating influence therein. It included the False Decretals, and no fewer than 367 spurious canons, and thus powerfully contributed to the falsification of the Western code. To this period belongs the term 'Jus Canonicum' itself, not found earlier, and having no Greek equivalent. A further collection of the growing mass of fresh decretals needed to be made, and this was first undertaken by Bernardo Circa, Bishop of Faenza, who brought them down to the pontificate of Celestine III. (1191-98). But this collection was superseded by that formed at the instance of Pope Gregory IX. by his chaplain, Raymond de Pennafort (afterwards general of the Dominicans, and canonised), about the year 1234. This body of documents forms that portion of the *Corpus Juris Canonici* entitled *Decretales Gregorii Papae IX.*, comprised in five books. To these were added a sixth by Boniface VIII. in 1298, known as *Sextus Decretalium*, or more briefly, the *Sext*. The next addition was the *Clementina*, or constitutions promulgated by Pope Clement V. at the Council of Vienne in 1308, and republished by his successor, John XXII., in 1317, who subjoined thereto twenty fresh enactments of his own entitled *Extravagantes Joannis*. Five books of still more recent documents, named *Extravagantes Communes*, coming down to 1483, in the pontificate of Sixtus IV., have further been embodied in the code; and the whole of these materials are collectively styled *Corpus Juris Canonici*, of which a corrected and standard edition was published by order of Pope Gregory XIII. But the word 'corrected' does not denote rejection of the spurious factors. The False Decretals, though called in question even before the Reformation by Nicolas of Cusa (1401-64) and Cardinal Torquemada (1388-1468), powerfully controverted by the Magdeburg Continuators (1560-74), and finally discredited by David Blondel in his *Pseudo-Isidorus et Turrianus Vapulantes* (Geneva, 1628), constitute an important element of the contents. Codification of canon law was set on foot by Pius X., who appointed a commission for the purpose. Cardinal Gasparri was especially active in the work. The *Codex* was promulgated by Benedict XV. in 1917.

The various parts of Western Europe had their local canon law derived from national synods and similar sources. Thus, in the empire, the Capitularies of Charlemagne and his successors contributed largely to the ecclesiastical law of Germany; and several collections of these (analogous to the Italian collec-

tions of papal decretals) were made from time to time, beginning with that of Angessius, Abbot of Fontenelle, in 827, recast and much enlarged by Benedict of Mainz twenty years later; and a collection passing under the name of Angilram or Ingelram, Archbishop of Metz, Charlemagne's chaplain and almoner, is noticeable as containing large extracts from the False Decretals, and as being hyper-papal in tone, whence it has been conjectured to have been the first draft of the more extensive forgery of Isidore Mercator, and probably also from his pen. In France a great body of canon law, framed independently of Rome, was compiled from the enactments of a long series of national synods, and helped to build up those Gallican liberties which were steadily maintained against attempted papal encroachments. Spain, too, though more readily admitting papal intervention, had its peculiar local code. In England, partly from national character, and partly by reason of its remoteness from Italy, the growth of a national code of canon law was rapid and luxuriant. Most of the enactments of which it consists were framed in provincial synods under various archbishops of Canterbury; but a certain proportion is formed of Legatine Constitutions, enacted in synods held under the papal legates, Otho and Othobon, sent to England by popes Gregory IX. and Clement IV. in the reign of King Henry III., and between the years 1220 and 1268. At the era of the Reformation, the statute for the submission of the clergy and restraint of appeals (25 Henry VIII. chap. 19) enacted that a commission of thirty-two persons, half clergy and half members of the two houses of parliament, should review and report on the existing canons; such as the commission approved were to be revalidated by the king's assent under the great seal, and such as they disallowed to be abolished. In the meantime, all such existing canons as were not contrariant to the laws of the realm, nor hurtful to the king's prerogative, should still be used and executed. But this commission never met nor acted, and attempts to bring it into operation fell through under both Edward VI. and Elizabeth, and have not since been renewed. The legal result is that the statute of Henry VIII. remains the ruling one upon the subject, and thus that (approximately) all the ancient canon law of England, which does not conflict with former or later canons or civil statutes, is still binding in ecclesiastical law. For post-Reformation canons, see CANONS OF THE CHURCH OF ENGLAND.

The bibliography of the canon law is very extensive, and only a few of the most essential works can be given here: Beveridge, *Synodikon, sive Pandectæ Canonum* (2 vols. folio, Oxford, 1872-82), and *Collatio Synodici* (2 vols. folio, Oxford, 1677); Justellus, *Bibliotheca Juris Canonici Veteris* (2 vols. folio, Paris, 1661); Fleury, *Institution au Droit Ecclésiastique* (2 vols. 12mo, Paris, 1771); Mastricht, *Historia Juris Ecclesiastici* (8vo, Halle, 1719); *Corpus Juris Canonici*, edd., Friedberg et Richter (2 vols. 4to, Leip. 1879); *Codex Juris Canonici* (præf. Card. Gasparri, 1917); Phillips and Vering, *Das Kirchenrecht der Katholiken und Protestanten in Deutschland* (1869 et seq.); Lyndwood, *Provinciale sive Constitutiones Anglicæ* (folio, 1679); Ayliffe, *Parergon Juris Canonici Anglicani* (1726); Johnson, *Laws and Canons of the Church of England* (1851); Gibson, *Codex Juris Ecclesiastici Anglicani* (1761); on the sources and history, Tardif (Paris, 1887) and Schulte (Stuttgart, 1875-83); F. W. Maitland, *Roman Canon Law in the Church of England* (1898); Ogle, *Canon Law in Mediæval England* (1912).

Canons, BOOK OF, in Scottish ecclesiastical history, a code of canons or rules for the Church of Scotland, prepared by the Scottish bishops, in obedience to the command of Charles I., revised by Laud, confirmed by letters-patent under the great seal, 23d May 1635, and published at Aberdeen in

1636. It tended much to increase the dissatisfaction prevalent throughout Scotland, which soon broke out so violently. It not only required the most strict adherence to the Liturgy, then not yet published, but enjoined many things concerning ceremonies in worship beyond what Laud had been able to introduce in the Church of England; it also took away the powers of church-courts unless ratified by the bishops, and decreed the penalty of excommunication against all who should deny the government of the church by bishops to be scriptural, whilst its very first canon decreed that penalty against all who should deny the king's supremacy in ecclesiastical affairs.

Canons of the Church of England, called Constitutions and Canons Ecclesiastical, agreed upon, with the king's license, in the synod held at London in 1603-4. They were drawn up by the Convocation of Canterbury, and accepted by that of York, in order to give effect to the decisions of the Conference held at Hampton Court; and are, for the most part, a digest of old injunctions and canons, with some new ones added. They are 141 in number. They are the basis of the ecclesiastical law, so far as the clergy are concerned, but they are not binding upon the laity, except in so far as they are declaratory of that part of the ancient canon law which had received parliamentary sanction. There had been previous bodies of canons drawn up in 1571, 1576, 1585, and 1597, but those of 1576 had not been sanctioned by the sovereign, and the remainder had been sanctioned for her lifetime only, and so lapsed at her death, not having been published in accordance with the Act 25 Henry VIII. chap. 19. Much of the code of 1603 has become obsolete, either by disuse or as the result of incompatible legislation by the civil power, and notably by the transfer of matrimonial and testamentary causes to the jurisdiction of secular courts. In 1640 the Convocation, which was then assembled with the parliament, prolonged its session beyond it under a fresh writ from the crown, and passed a body of canons of a very aggressive character; amongst other things, enjoining that on some Sunday in every quarter, every officiating minister should insist on the divine right of kings and their prerogatives, and enforce conformity to the rites of the Church of England. In these canons it was directed that the communion-table should be railed in, and be placed as in cathedrals, which is now done in all churches; and another canon obliged the clergy to swear conformity to the Church of England in a form known as the 'Et Cætera Oath,' which raised an uproar throughout the country. These canons were abrogated by an act passed in the 13th year of Charles II. An account of these canons and those now in force may be found at length in Hook's *Church Dictionary*.—Every clergyman, when instituted to a benefice or licensed to a cure, promises *Canonical Obedience* to the bishop—i.e. the obedience due according to the canons of the church.

Canopus, or CANOBUS, a city of ancient Egypt, from which the Canopic mouth of the Nile derived its name, was situated on the sea-coast, 15 miles E. of Alexandria. Here the boundary line between Asia and Africa was drawn by the ancient geographers. Canopus had a famous temple of Serapis, considerable commerce, and an evil reputation for the luxury of its citizens. Its ruins are visible near Aboukir. Canopic Vases, named from the city, were vases used by the Egyptian priests to contain the viscera of embalmed bodies. Canopus is also the name of a star of the first magnitude in the southern constellation Argo.

Canopy (Lat. *conopeum*; Gr. *kônōpeion*, from *kônōps*, 'gnat' or 'mosquito') was originally a

mosquito-curtain. Herodotus (ii. 95), Horace (Epod. ix. 9), and others of the ancient writers mention gnat-curtains (conopea). Subsequently the same term came to be used for the projecting covering and hangings of a bed, without reference to their original use, and latterly for any projecting covering of a similar form, to whatever use it might be adapted, or of whatever materials it might be formed. Canopy is thus used to signify the covering which is borne over the heads of kings and other persons of distinction, and still more frequently over the Holy Sacrament and the image of Christ in processions in Roman Catholic countries. See BALDACHIN.

In Gothic architecture, canopy is the term applied to the stone coverings usually projected over statues,

both on the exterior and in the interior of buildings, to protect them from the rain and dust. They were introduced as early as the 12th century, and were then designed so as to resemble a small gabled roof or the top of a building furnished with gables and turrets. As the style advanced, the design of the canopies was carried out in harmony with the other features of the various periods, becoming in the Decorated period more like a pinnacle in shape and ornament, while in the Flamboyant and Perpendicular the canopies partook of the florid and fantastic character of those styles.

Canopy — Archbishop Peckham's Monument, Canterbury Cathedral.

The term canopy is also applied to the gable-shaped and crocketed mouldings frequently placed over doors, windows, niches, &c.; also to ornamental stone coverings placed over tombs, of which fine examples may be seen in Westminster Abbey. The wooden coverings erected over the prebendaries' stalls in cathedrals, which are of infinite variety of design, are also called canopies, as well as the lofty ornamental tops which are often introduced over bishops' thrones, pulpits, and altars.

Canosa, a town of Southern Italy, in the province of Bari, 13 miles SW. of Barletta. It is situated on the declivity of a steep hill, whose summit is crowned by a ruined castle. It has a cathedral (1101–1825), with the tomb of Bohemond I.; but it is chiefly remarkable as occupying the site of ancient *Canusium*, one of the chief cities of Apulia. Sepulchres have been found here containing painted vases and funereal furniture of the most magnificent description, painted busts, marble statues, &c.; and countless antiquities have been transferred hence to the museum at Naples. There are also ruins of an amphitheatre, gateway, aqueduct, &c. Canosa suffered by earthquake in 1851. Pop 25,000. See CANNÆ.

Canossa, a ruined castle of Northern Italy, 12 miles SW. of Reggio. In its courtyard the emperor Henry IV. (q.v.) stood shivering, bareheaded and barefooted, for three whole days (25–28th January 1077) before Pope Gregory VII., who was staying here with the Countess Matilda of Tuscany,

admitted him to his presence, and removed the ban of excommunication.

Canova, ANTONIO, the founder of a new school of Italian sculpture, was born November 1, 1757, at Possagno, a village in the Venetian territory. Having displayed in boyhood great talent in modelling, the artist gained the patronage of Giovanni Falieri, a Venetian senator, by whom he was sent to work under a sculptor at Bassano. His first imaginative performance, 'Eurydice,' half the size of life, was executed in his seventeenth year. After this he went to Venice, where his study of art properly began. In 1779 Falieri sent him to Rome, with an introduction to Cav. Zuliano, the Venetian ambassador, and one of the most illustrious patrons of art at this time in Italy. In Rome the first result of his studies appeared in the statue of 'Apollo,' which must be regarded as his earliest effort in ideal sculpture; but a far greater progress toward the pure style of the antique was evident in his next work, 'Theseus with the Minotaur,' executed in 1782. Nevertheless, Canova did not rigorously adhere to the severe simplicity of the antique, but endeavoured to infuse into his works a peculiar grace and loveliness of his own, such as characterised his group of 'Cupid and Psyche,' which was produced soon after he had completed, in 1787, the monument of Pope Clement XIV. This is apparent even in the colossal monument of Clement XIII. (erected in St Peter's, 1792); though this work, on the whole, is a magnificent effort of genius, simple in style, and with nothing overwrought in the figures. The most important of his monuments is the tomb of the Archduchess Christina of Austria, in the church of the Augustines in Vienna. Among his other works may be noticed a 'Winged Cupid;' 'Venus and Adonis;' a 'Psyche holding a Butterfly;' 'Penitent Magdalen,' in life-size; 'Hercules hurling Lichas from the Rock,' a colossal work, but not free from affectation; 'Creugas and Damoxenos' (two pugilists); 'Palamedes;' and 'Perseus with the head of the Medusa,' a work which, more than all previous efforts, served to raise his fame. In 1802 Canova was appointed by Pope Pius VII. chief curator of all Roman works of art in the Papal States; but in the same year he was called away to Paris, to prepare the model of a colossal statue of Bonaparte.

After the fall of the French empire, Canova in 1815 was employed by the Roman government as ambassador to recover the works of art which had been taken to Paris, and paid a visit to England. On his return to Rome, he was created Marquis of Ischia, with a pension of 3000 scudi. This money he expended in the support of art and artists in Rome. Canova died in Venice, 13th October 1822. The essential characteristic of all his works is sentiment—often verging, however, on sentimentalism, and this also, like his delicacy in details, was accordant with the taste prevalent in his time, and was the chief cause of his popularity, as of his errors. Judged by the sterner principles of antique sculpture, the works of Canova are artificial and deficient in force and realistic character.

During his leisure Canova amused himself with painting, in which he followed the colouring of the Venetian masters. In his private life he was a very amiable and benevolent man. Biographies of Canova have been written by Missirini (4 vols. Prato, 1824), Cicognara (Venice, 1823), Rosini (Pisa, 1825), and D'Este (Flor. 1864). A series of outline engravings, by Henry Moses, from his works, was published in London in 1824, with translations of the descriptions of the Countess Albrizzi and of the memoir by Count Cicognara.

Canrobert, FRANÇOIS CERTAIN, Marshal of France, born at St Ceré in Lot, 27th June 1809,

studied in the military academy of St Cyr, and in 1828 entered the army. He had seen close upon twenty years' brilliant service in Algeria, and had actively supported the future emperor at the *coup d'état* of 1851, when in January 1853 he received the rank of a general of division. As such he commanded the first division of the French army under Marshal St Arnaud, sent to the Crimea in 1854; and at the battle of the Alma was wounded in the breast and hand by the splinter of a shell. On St Arnaud's death nine days later, Canrobert assumed the chief command of the French army. According to Kinglake, he deliberately retarded the progress of operations, let slip many opportunities, and hampered the English—his object therein being to forward Napoleon's plan of himself coming out to head a final and victorious campaign. In the war in Italy against the Austrians (1859) Canrobert had the command of the third division of the French army, and at the battles of Magenta and Solferino his *corps d'armée* was engaged. In the Franco-German war of 1870 he was shut up in Metz with Bazaine, and became a prisoner in Germany. In 1876 he became a member of the senate, and he died 28th January 1895. See *Lives* by Martin (1895) and Germain Bapst (4 vols. 1893-1909).

Canso, CAPE, the eastern extremity of Nova Scotia, at the entrance of Chedabucto Bay. Canso Strait, a passage 17 miles in length and 2½ in average breadth, separates Nova Scotia from the island of Cape Breton.

Cant, ANDREW, a Scottish Covenanter, born about 1590, became minister of Pitsligo in 1633, of Newbattle in 1638, and of Aberdeen in 1640. In July 1638 he had been one of the commissioners sent to that city to compel the inhabitants to subscribe the National Covenant; and in November of the same year he was a member of the memorable General Assembly, held at Glasgow, which abolished Episcopacy in Scotland. Withal, he was a zealous royalist. He was with the Scots army when it obtained possession of Newcastle, August 30, 1640; and in 1641, on the second visit of Charles I. to Scotland, Cant preached before his majesty at Edinburgh. In 1660, in consequence of a complaint presented to the magistrates of Aberdeen, charging him with having published Rutherford's *Lex Rex*, and with fulminating anathemas and imprecations against many of his congregation, Cant relinquished his charge and left the town. He died 30th April 1663, leaving a son, Andrew, who was principal of Edinburgh University from 1675 to 1685.

Cantabile, in Music, is a term placed over sections of easy and flowing melody, in contradistinction to brilliant passages or rapid executive runs, as well in instrumental as vocal music. In the cantabile style the finest effects can be produced by the singer in swelling, sustained sound, the portamento, &c. Cantabile is also called *cantilena*.

Cantabrigi, a rude race of mountaineers in the north of ancient Spain, who inhabited the region south of the Bay of Biscay, named from them the *Oceanus Cantabricus*. The question of their affinities forms part of one of the most difficult problems in the whole range of ethnology. W. von Humboldt identified them as a remnant of the ancient Iberian population of Western Europe, and found their descendants in the modern Basques of the Pyrenees. The bravery of the Cantabrians was evinced in the Cantabrian war with the Romans, begun under Augustus in 25 B.C., and concluded by Agrippa six years later. Their indomitable spirit is often alluded to by Horace and other poets. Tiberius afterwards stationed garrisons in the towns, but some of the people retreated into their fastnesses among the mountains, where they pre-

served their independence. Of their nine towns the chief was Julisbrica.

Cantacuze'nus, a Greek princely family. (1) JOHANNES CANTACUZENUS was a noted soldier and statesman of the Byzantine empire in the reigns of Andronicus II. and III., the latter of whom in 1341 left him guardian and prime minister of his son, Johannes V., then nine years old. Cantacuzenus, however, proclaimed himself the child's colleague, 26th October 1341, and after a five years' civil war secured his recognition, as well as the marriage of one daughter to the young emperor, and of another to the Sultan Orhan, whose help had been necessary to him. A second war, during which the Turks occupied Gallipoli, caused his retirement in 1355 to a monastery, where he died in 1383. He wrote a history of his time, and a defence of Christianity.—(2) MATTHIAS, his son, was also made a colleague in the empire in 1353, and on his father's abdication began a war which ended, two years later, in his own deposition. He too died in 1383.—(3) His brother, MANUEL (died 1380) was governor of Peloponnesus from 1348, and was recognised as despot of Misithra by Johannes V.; he did much to encourage the immigration of the Albanians into the depopulated Morea.—The family was notable among the Fanariots (q.v.), and in later years a Russian branch supplied several brave and successful leaders to the cause of Greek independence.

Cantal, a department in the interior of Southern France, formed out of the south portion of the old province of Auvergne. With an area of 2229 sq. m., it had a population in 1890 of 239,601, in 1921 of only 199,402. See AUVERGNE.

Cantarini, SIMONE, also known as IL PESARESE, an Italian painter, born at Pesaro in 1612, studied under Guido Reni at Bologna, where he afterwards painted a large number of pictures, all much in the style, but without the grace and delicacy of his master's works. His thirty-seven etchings more closely resemble those of Guido. Throughout his life Cantarini's intolerable arrogance made him numerous enemies; and after a quarrel with his chief patron, the Duke of Mantua, he died at Verona in 1648, not free from a suspicion of having poisoned himself.

Cantata, in Music, was originally the name applied to a sort of musical narrative by one person, accompanied by a single instrument. Subsequently an air was introduced, repeated at intervals during the recitative. Many works now forgotten were written in this form by Carissimi and other composers of the 17th and 18th centuries. It is represented in modern music by the concert-aria (see ARIA). The name is now applied to choral works, either sacred, and similar to, but shorter than the oratorio; or secular, either lyric or dramatic, but not intended for the stage.

Canteen is a refreshment-house in a barrack for the use of the soldiers. In the British army bread and meat are supplied to the soldier direct by the commissariat, but he has to buy beer and groceries for himself; and the canteen is a shop where he can do so at practically cost price, with a certainty that they will be good, without going beyond the precincts of the barrack. The men living in each room are formed into a mess, which opens an account with the canteen for the supply of dinner beer, tea, coffee, potatoes, and other similar necessaries. The mess accounts are kept by the non-commissioned officer in charge of the room, made up weekly, and inspected by an officer. A certain fixed sum is charged to each man's account to defray the mess expenses, and the canteen bill is paid monthly. A mess is not allowed to get into debt to any extent. If one

week's account shows a deficit, the men have to go without something the next week in order to clear it off. They can also buy anything they like from the canteen on their own account, paying for it in cash. Formerly the canteens were under civilian tenants, at rents varying from £4 to £1344 per annum, realising collectively about £70,000 annually. Gross intoxication having resulted from the sale of spirits at the canteens, the War Office prohibited such sale in 1847, lowering the rents by £20,000 to meet the reduced profits. As it was to the tenant's interest to encourage the soldier to drink, as well as to adulterate the articles sold, and to charge high prices, the canteen has since 1857 been made a regimental establishment, controlled by a committee of officers, with a canteen-sergeant, on a fixed salary, as salesman. Tobacco and the smallwares required by the troops are also sold at canteens. The profits are utilised for the benefit of the men and the families of those who are married. Canteen procedure is, since the Great War, unified under the control of the Navy and Army Canteen Board, which depends on the Quartermaster-general's department of the War Office.

In French barracks the canteen is a sort of club-room for the whole regiment. The *cantiniere* is a non-commissioned officer, who acts merely as an agent for all, selling commodities at prime cost.

Canterbury, a county borough, cathedral city, and the seat of the metropolitan see of all England, in east Kent, 56 miles ESE. of London. Standing in a plain on the banks of the Stour, amid gently swelling hills, it occupies the site of the Roman *Durovernum* and Jutish *Cantwaraburh* ('borough of the men of Kent'), and from its position on the great London high-road must always have been a place of importance. There are some remains of the ancient walls (1½ mile in circuit and 20 feet high), and the West Gate (*circa* 1380) is the survivor of six. Near the city wall is a large artificial mound, known as the Dane John (probably *Donjon*), and connected with this mound is a public garden, laid out in 1790, from the top of which is a fine view of the country around. The much mutilated castle, whose Norman keep resembled Rochester's, has been degraded to a gaswork; the guildhall (1439; rebuilt 1697) has been refaced with modern brick; and the Chequers' Inn, where Chaucer's pilgrims lodged, lost its 'dormitory of the hundred beds' by fire in 1865.

But the great glory of Canterbury is its magnificent cathedral, whose precincts are entered through a splendid Perpendicular gateway (1517). When in 597 St Augustine became Archbishop of Canterbury, he consecrated, under the name of Christ's Church, a church said to have been formerly used by Roman Christians. Enlarged by Archbishop Odo (942-959), this church was totally destroyed by fire in 1067. Archbishop Lanfranc and Priors Ærnulf and Conrad rebuilt it (1070-1130), and it was this cathedral that witnessed the murder of Becket, 29th December 1170. The choir was wholly burned down in 1174, and to rebuild it a number of French and English artificers were summoned. Among the former was one William of Sens, and to him, a man of real genius, the work was entrusted. The

church was rich in relics: Plegmund in 890 had brought hither the body of the martyr Blasius from Rome; here too were the bodies of SS. Wilfrid, Dunstan, and Alfege, and now of the great martyr, St Thomas of Canterbury. The offerings at these shrines, especially the last, contributed greatly to defray the expenses of the sumptuous work. William of Sens did not, however, see its completion. He was succeeded in 1178 by another William, an Englishman, and to him we owe the completion of the existing unique and beautiful choir, with the choir transept, the retro-choir or Trinity Chapel, and the corona or circular apse called Becket's Crown. Gervasius, a monk, who witnessed the fire of 1174, and has left an account of it, tells us that the parts of Lanfranc's church which remained in his time were the nave, the central and western towers, the western transepts, and their eastern chapels. In 1378-1411 the nave and nave-transepts were transformed by Prior Chillenden into the Perpendicular style of that period. The central or 'Bell Harry' tower, successor to the Angel steeple, was carried up (1495) to about double its original height; also in the Perpendicular style, it is 235 feet high, and 35 feet in diameter. The north-west or Arundel steeple was taken down and rebuilt in 1834-40; like the south-west or Dunstan steeple (1413-44), it is 130 feet high. The Norman plinth still remains on each side of the nave in the side aisles, and portions of Norman ashlar-work may still be seen about the transepts outside the west wall, and on the east piers of the great tower. The indiscriminate use of the Round or Norman and the Pointed or Early English arch is also a very striking feature in the eastern part of the building. The Lady Chapel,

Canterbury Cathedral.

now called the Dean's Chapel, stands on the north side of the church, and was built between 1449 and 1468; the roof is a rich fan-vault. The adjoining north transept is called the Martyrdom transept, for here took place the murder of Becket. In 1220, fifty years later, his remains were translated from the crypt to a shrine in the newly erected Trinity Chapel, eastward of the choir. About the year 1500 the yearly offerings at this shrine amounted to £4000 of our present money, though then they had declined much in value. A curious mosaic pavement still remains in front of the place where the

shrine stood, and the stone steps which lead up to it are worn by the knees of countless pilgrims; but the shrine itself was demolished in 1538, when its treasures filled twenty-six carts. (In 1888 a stone coffin, with remains of a skeleton, supposed to be Becket's, was discovered in the crypt, and reinterred there after careful examination.) In 1643 the building was further 'purified,' as it was called, by order of parliament. Still very many most interesting monuments remain—such as the tomb of Stephen Langton; that which is commonly, but wrongly, supposed to be the tomb of Archbishop Theobald; with those of the Black Prince, of Henry IV., of Archbishops Peckham, Meopham, Stratford, Sudbury, Courtenay, Chicheley, Stafford, Kemp, Bourchier, Morton, Warham, and Cardinal Pole. The fifty-one statues that since 1863 have adorned the south porch and the western entrance include 19 of Canterbury's archbishops, 21 English sovereigns, 3 deans, Erasmus, &c. Of stained glass there are some fine old specimens; some modern ones of very varied merit, two of these being very fine. The total length of the cathedral is 522 feet, by 154 in breadth at the eastern transept. Its predominant styles are Transition-Norman and Perpendicular. The crypt is of greater extent and loftier—owing to the choir being raised by numerous steps—than any other in England. In 1561 it was given up by Elizabeth to a congregation of French and Flemish Protestant refugees, whose successors now meet in the Black Prince's chantry. In 1872 the church narrowly escaped destruction for the fourth time by fire, the outer roof being burned, over all the east portion of the choir.

To the north of the cathedral are the eight-bayed Cloisters, 144 feet square; the Chapterhouse (1411), 90 by 35 feet; the New Library; the Howley Library, containing the books of Archbishop Howley and Archdeacon Harrison; the beautiful Green Court; the Deanery (1517); and the King's School, founded or refounded (1541) by Henry VIII., and attended by Marlowe, Lord Tenterden (natives), Dr Harvey, and 'David Copperfield.' These occupy the site, and in part the buildings, of the Benedictine Priory of Christ's Church. The remains of the Abbey of St Augustine, to the east, were in 1844-48 transformed by Mr Beresford Hope into an Anglican missionary college. In and near the Abbey 20th-century excavations have laid bare the tombs of Saxon kings and the foundations of Ethelbert's church (with the empty tombs of some of the first archbishops), of Wilfred's round church and other early remains. There are fourteen old churches in Canterbury, mostly of rough flint, and containing fragments of still older structures. St Martin's Church stands on the site of one of the 6th century, and is partly built of ancient Roman brick and tile; its font is said to be the very one in which Ethelbert was baptised by St Augustine. St Dunstan's contains the monuments of the Ropers, and, in a vault, the head of Sir Thomas More. The archbishop's palace, scene of the death of the Black Prince, was built by Lanfranc, superseded for centuries by Lambeth and Addington Park, but rebuilt by Archbishop Temple shortly before his death in 1902. The Clergy Orphan School is built on St Thomas's Hill, about a mile out of the city; the Simon Langton Schools were opened in 1882. There are, besides, several hospitals, barracks, a corn exchange, an art gallery (now a school of arts and crafts), presented by Sidney Cooper (a native), a free library and museum. Canterbury has a large trade in grain and hops, and a great 'cricket week.' In 1885-1918 the city returned only one member; it was then merged in the county. Pop. 24,000.

See the articles ARCHBISHOP, ENGLAND (CHURCH OF), and those on the various archbishops and others mentioned

above; Boggis, *St Augustine's Monastery of Canterbury* (1901); Gleeson White, *The Cathedral Church of Canterbury* (1897); also Professor Willis's *Architectural History of Canterbury Cathedral* (1845-69), Dean Stanley's *Historical Memorials* (1854; new ed. 1904), the *Memorials* by Woodruff and Danks (1913), Dean Hook's *Lives of the Archbishops of Canterbury* (1860-76), Jenkins's *Diocesan History* (1880), and books on the city by Teignmouth Shore (1907) and G. R. S. Taylor (1912).

Canterbury, a 'provincial district,' till 1876 a province, of New Zealand (q.v.), with Christchurch as its capital, and Lyttelton as its port. Its area is about 14,000 sq. m., and it is divided into two portions by the river Rangitara. The district was settled in 1850 by the Canterbury Association, a society of peers, bishops, and commoners interested in the colonisation of New Zealand. It has a coastline of about 200 miles, a breadth of about 150, and is well watered by numerous rivers. Banks Peninsula, in its peaks, ridges, and basins, bears evidence of volcanic action. Coal in abundance, iron ore, fireclays, quartz, and gold exist, and several coal-mines are in operation. On the eastern side of the great range of hills are the far-famed Canterbury Plains, the great sheep district of the dominion—'three millions of acres rolling back in gentle rise forty miles, to the foot of the central highlands, watered by twenty rivers, and spreading north and south farther than the eye can reach.' There is railway connection from Christchurch to Dunedin and the south and west coasts, with various branch lines. The staple trade is in wool and grain, with exports of frozen meat, New Zealand flax, skins, leather, and dairy-produce. Canterbury College (University of New Zealand) is at Christchurch. The medicinal hot springs at Haumai Plain in Amuri district have considerable celebrity. Mount Cook (12,349 feet) is the highest mountain in New Zealand. Pop. (1878) 91,922; (1921) 199,038.

Canterbury Bells. See CAMPANULA.

Cantharellus, a genus of hymenomycete Fungi (q.v.). The chantarelle, chanterelle, or chanterelle (*C. cibarius*), eaten on the continent, has a yellow cap, in form of an inverted cone.

Cantharis, a genus of vesicant Coleoptera or Blister-beetles, familiarly represented by the Spanish Fly of southern Europe (*Cantharis* or *Lytta vesicatoria*). Some of the characters are noted under BLISTER-BEETLE. The insects are shaken with gloved hands from the branches of trees (ash, privet, lilac, elder, &c.), the gathering in the south of France taking place in May; they are usually killed in hot vinegar solution and carefully dried. To retain their medicinal vesicant properties they must be kept in stoppered bottles. The blistering principle, or cantharidin, is so powerful that those who gather the insects are apt to suffer, and rash of a grain placed on the lip will raise blisters. Incautious internal application may cause fatal inflammation. Cantharidin took the place of cantharides in the British Pharmacopoeia of 1914. A distilled alcoholic solution of cantharidin is sometimes called Aqua Tofana (q.v.). The insects are usually imported to Britain from southern Europe or Russia. They rarely occur in England.

Canticles (literally 'unmetrical hymns or songs') is the name given to a book in the Old Testament, more generally known by its Hebrew title 'Song of Songs'—i.e. the most beautiful song in the world. The 'Song of Songs' was one of the last books to be added to the Old Testament, and full recognition was not granted to it as a canonical book of Scripture till the Synod of Jamnia in 90 A.D. (see BIBLE, *Formation of the Old Testament Canon*). There has been considerable discussion

as to the character, value, and interpretation of the book. Three different attitudes have been adopted towards it at different times. (1) After its admission into the canon, Jewish and Christian writers alike interpreted its statements allegorically. On the face of it, the book seems to consist of a collection of love-songs; but it was argued that the surface meaning of the Canticles could not represent its real teaching, since, if that were so, it would not be worthy of a place in the Bible. The songs must therefore have a symbolical reference. The love which is so vividly described could not be ordinary human affection, but must have a spiritual significance. Jewish writers made it symbolise the relation between God and Israel, and Christians, following the precedent set by Jewish rabbis, found in the Beloved Bridegroom a reference to Christ, and in the Bride a reference to the Church. In the middle ages the famous Bernard of Clairvaux preached a series of eighty-six discourses on the first two chapters of the book, adopting this 'mystical' or 'allegorical' method of interpretation. In these discourses the 'Bride' represents Christ, and the 'Bridegroom' the soul of the individual Christian. In devotional literature, even up to the present day, phrases from the book, such as, 'The chief among ten thousand,' 'the rose of Sharon and the lily of the valley,' 'My beloved is mine, and I am his,' are constantly applied to Christ. It was the use of this method of interpretation which led Rabbi Akiba to describe the book as a 'Holy of Holies,' and to say that 'no day in the history of the world is worth the day when the Song of Solomon was given to Israel.' Some protests were made at different times against this allegorising method, but they were never successful, and often met with reprobation. The attempt of Theodore of Mopsuestia to lead men back to a literal interpretation of the book resulted in the condemnation of his writings by the Synod of Constantinople in 551, long after his death, and Castellio was banished from Geneva in 1544 because he denied the spiritual meaning of the book, and argued that it was an amatory poem. It is only in recent days that the allegorical interpretation has been finally abandoned, and the Church has recognised that the plain meaning of the book is the true one. But having reached this decision, scholars are still divided as to the character of Canticles. (2) The most popular modern interpretation regards the book as a drama, the *motif* of which is the praise of constancy in love. The plot, however, is so slight and indistinct that no general agreement has been reached as to the number of the *dramatis personae* or the division of the scenes. The best suggestion as to the plot is as follows: 'A Shulamite girl of great beauty is captured by some of Solomon's servants and brought to the palace. The king, attracted by her charm, makes ardent love to her, and wishes to add her to his harem. The girl in the poems seems to be responding to the king's overtures, but all the while she is thinking of her shepherd lover in the north, from whom not even the glamour of a royal alliance can divert her affection. At length the king, out of admiration for her constancy, returns her to her lover, and the melodrama ends with a wedding scene.' It must be admitted, however, that the plot is not apparent to the ordinary reader, and it is only by reading much into the songs that it can be obtained. The best exposition of this and other similar interpretations is to be obtained from Rothstein's article on the 'Song of Songs' in *Hastings's Bible Dictionary*. (3) The difficulty of finding any real plot in Canticles has led other scholars to suppose that the book is an anthology of Hebrew love-poems or wedding-songs, which are only connected together in the loosest possible way. Some

have discovered as many as thirteen different poems, but there is no general agreement as to the actual number. This theory is fully developed by Cheyne in the *Encyclopædia Biblica*. It used to be maintained that the book dated from pre-exilic times, and was a protest against the laxer morals introduced into the court by Solomon and his successors; but the Hebrew style, which belongs to a much later age, seems to make that view impossible, and it is now generally recognised that Canticles is certainly post-exilic, and may even be as late as the Greek period.

The best commentaries on Canticles are by Delitzsch, Hitzig, Ewald, Renan, Stickel, and Siegfried.

Cantilever, a large bracket for supporting cornices, balconies, and stairs. Cantilevers are often highly ornamented. The accompanying example supports a wide outside stone stair at the corner of Randolph Crescent, Edinburgh.

Cantilever.

For cantilever in bridge-building, see BRIDGE.

Canto Fermo. See the articles PLAIN-SONG, CHANT.

Canton, called also Yang-Ching (i.e. 'city of rams'), a large commercial city and port in the south of China, and capital of the province of Kwang-tung (of which the name Canton is merely a corruption), is situated in 23° 11' N. lat., and 113° 14' E. long, on the north or left side of the Shu-kiang, or Pearl River, in a rich alluvial plain, 70 miles N. of Macao and 90 NW. of Hong-kong. The Pearl River is the estuary of the same stream that higher up is called Boca Tigre (q.v.), or Bocca Tigris. Farther up still, the stream is known as the Canton River; and this is but the chief channel by which the united waters of the Si-kiang and the Pe-kiang rivers reach the sea through the delta. The city was till 1919 surrounded by walls of brick and sandstone, 25 to 40 feet high, 20 feet thick, with an esplanade inside, 6 miles in circumference; and divided by a partition wall running east and west into two unequal parts, the north or old city, much the larger, and the south or new city. There were twelve outer gates, four gates in the partition wall, and two water gates, shut and guarded by night. The entire circuit, including suburbs, is nearly 10 miles. At the south-west corner of the suburbs, south of the river, are the Hong or European quarter, divided from the river by a quay, 100 yards wide, called Respondentia Walk. The streets, more than 600, are in general less than 8 feet wide, and very crooked, but some motor-roads have been made since 1919, including one which encircles the city on the site of the wall. The houses along the water-side are built on piles, and subject to inundations. Ancient barricades enclose each street, and in the principal streets night-watchmen in watch-towers proclaim the hours and sound fire alarms. There are two pagodas, the 'Plain Pagoda,' erected ten centuries ago, 160 feet high, and an octagonal nine-storied pagoda, 175 feet high, erected more than 1300 years ago; and 124 temples or Joss-houses. The Honam temple, one of the largest in Canton, covers, with its grounds, 7 acres. Hundreds of priests are attached to it and to the 'Temple of Filial Duty.' The 'Temple of Five Hundred Genii' has 500 statues of various sizes in honour of Buddha and his disciples. The Examination Hall in the old city is 1330 feet by 583 feet, covers 16 acres, and has 8653 cells. There are also in Canton several

prisons, an arsenal, a mint, a handsome English church, many public schools and colleges, a founding hospital, an English and an American missionary hospital. Nearly half the craft on the river are fixed residences, and the population on water forms a very large proportion of the whole. The climate of Canton may be pronounced healthy. The average temperature ranges from 42° to 96° F.; though falls of snow have occurred. There are fogs in February and March. From October to January the temperature is agreeable, the sky clear, the air invigorating. The average rainfall is 70 inches annually.

The admirable situation of Canton, connected by three rivers with the whole province east, north, and west, and to the west with the distant interior of China, and commanding a safe and commodious anchorage for the largest vessels, explains how, from an early period, it was a favourite port with foreign merchants. The earliest notices date back to two centuries B.C. In 700 A.D. a regular market was opened and a collector of customs appointed. The Arabs made regular voyages hither as early as the 9th century. The Portuguese found their way to it in 1517, and were followed by the Dutch a hundred years later. These in turn were overtaken and supplanted by the English before the close of the 17th century, and an immense trade was carried on by the agents of the East India Company. Their monopoly ceased on the 22d April 1834. Since that date the proceedings of the Canton government officers have originated two wars with the British. The city was captured by the allied French and English forces, December 1857, and continued to be garrisoned by them till October 1861 (see CHINA). After the treaty of Nankin (signed 29th August 1842), Canton was known as one of the five treaty ports, with Amoy, Fuchow, Ningpo, and Shanghai. Foreign commerce, however, is still hampered in many ways in Canton. The general insecurity of property renders it necessary that every shop which contains anything of value should be barricaded at dusk, so that it could stand a siege: at sunset business must stop.

The chief exports are silk, tea, porcelain, matting, sugar, and cassia; the chief imports, cotton, woollen, and metal goods, food-stuffs, kerosene, &c. The city is one of the chief silk manufacturing centres in China; it has also wool and cotton mills. Canton played a leading part in the republican movement, and as champion of parliamentary government and socialism headed the south against Peking and the north. The population of the city, variously estimated between 500,000 and 2,500,000, is probably under a million.

Canton, capital of Stark county, Ohio, on the Nimishillen Creek, 56 miles SSE. of Cleveland by rail, with foundries, extensive iron and steel manufactories, paper and woollen mills, &c.; pop. (1860) 4041; (1880) 12,258; (1920) 87,091.—(2) A town of Fulton county, Illinois, 25 miles WSW. of Peoria, with coal-mining and some factories; pop. 11,000.—(3) A town of Norfolk county, Massachusetts, 14 miles S. of Boston, with cloth and metal manufactures; pop. 6000.

Canton (Fr.), a division of territory, constituting a separate government or state, as in Switzerland; or, as in France, a collection of communes, forming a subdivision of an *arrondissement*. In France the *canton* sends one member to the council of the *arrondissement*, but is in no other sense an administrative division.

Canton. See HERALDRY.

Canton, JOHN, electrician, born at Stroud, 31st July 1718, was apprenticed to a cloth-weaver, but early showed a bent towards scientific studies. In 1737 he settled as a schoolmaster in London, and,

becoming famous for his experiments in electricity, was elected a Fellow of the Royal Society in 1749. He repeated and verified Franklin's experiments and hypotheses; he invented an electroscope and an electrometer; he originated experiments in induction; he was the first to make powerful artificial magnets; and in 1762 he demonstrated the compressibility of water. His name is permanently associated with 'Canton's phosphorus,' discovered by him in 1768—an impure sulphide of calcium, prepared by heating calcined oyster-shells with sulphur in a closed crucible. After being exposed to light, it shines in the dark like luminous paint (see CALCIUM). Canton, who was a friend of Priestley's, died 22d March 1772.

Canton, WILLIAM, born in 1845 in Chusan, and educated in France, was on the staff of the *Glasgow Herald* and the *Contemporary Review*, and managed a publishing house. He wrote *The Invisible Playmate*, *W. V. her Book*, *The Comrades*, and other books in prose and verse, including several on the Bible and the Bible Society.

Cantonments are the villages, farms, or other buildings in which troops are temporarily lodged while taking part in manoeuvres or active operations. In the latter case a careful arrangement of guards and sentries is necessary to prevent the men being surprised before they can turn out of the houses; and places of assembly, called alarm posts, are selected at which they can collect.

In India, however, *cantonments* have become permanent military towns, distinct and at some little distance from the principal cities. A large *cantonment* contains barracks for European troops; bungalows or houses, in gardens, for the officers; huts for the native soldiery; magazines and parade-grounds; public offices and buildings of various kinds; and a bazaar for the accommodation of the Camp Followers (q.v.) and other natives. See BILLETING, BIVOUAC, and CAMP.

Cantor. The Latin genitive *Cantoris* is used to denote the north side of the choir in English cathedrals, as the precentor or cantor usually sat at that side. The south was the dean's side (*Decani*). See CHOIRS.

Cantù, CESARE, Italian author, was born 8th December 1807, at Brivio, in the Milanese territory, and was destined for the priesthood, but early adopted literature as a profession. Imprisoned in 1833 for expressing liberal tendencies in an historical work on Lombardy, he spent his leisure hours in describing the sorrows of a prisoner in an historical romance, *Margherita Pusterla* (1838), only less popular than Manzoni's *I Promessi Sposi*. His *magnum opus*, the *Storia Universale* (35 vols 1836-42), was succeeded by a multitude of works on Italian history and literature, as well as works of a lighter character, and *Manzoni: Reminiscenze* (2 vols. 1883). He died at Milan, 11th March 1895.

Canute. See CNUT.

Canvas, ARTISTS', the principal material upon which oil-paintings are made. Before it is put into the artist's hands it is usually *primed*, or grounded of a neutral gray, or other tint, as he may direct. Certain sizes of canvas, being in greater request than others, are kept ready mounted on wooden stretchers. The stretchers are provided with wedge-shaped keys at the corners, for tightening the canvas should it become slack. Those used for portraits are known by the names of kit-cat, which measures 28 or 29 inches by 36; three-quarters, 25 by 30 inches; half-length, 40 by 50; Bishop's half-length, 44 or 45 by 56; Bishop's whole length, 58 by 94.

Canvas-back Duck (*Fuligula valliseria*), a common bird on the Atlantic coasts of the United

States, abundant for instance in Chesapeake Bay. It belongs to the general group of wild ducks, but ornithologists have differed somewhat as to its generic title. The names *Aythya*, *Nyroca*, *Aristonetta*, *Fulix*, and *Fuligula* seem all applied to it. It is a handsome bird, especially in the somewhat larger and more decorative male sex. The popular name refers to the ashy-white colour of the male's back, crossed by broken zigzag lines. *F. americana* or Red-head Duck is closely allied. Both, but especially the Canvas-back, are prized for the table.

Canzone is the name of one of the most important forms of Italian lyric poetry. It seems to have grown out of the *canzo* of the troubadours, which was in their hands, however, exclusively reserved for themes of love. The Italian canzone consists of a series of stanzas, of various metrical arrangements, and restricted to no set themes. In the Petrarchian canzone the stanzas exactly correspond in the number and measure of the lines, as also in the sequence of the rhymes. It often concludes with a short stanza, known as the *envoi*. Petrarch is the great master of the canzone in the earlier, and Leopardi in the later, period of Italian literature. In music, *canzona* and *canzonetta* or *canzonet* are songs of similar character to the madrigal, or instrumental imitations thereof. *Canzonetta* has also been extended to vocal solos, especially of a light order. The French *chanson* is simply a song.

Caoutchouc. See INDIA-RUBBER.

Cap. See BONNET, PERCUSSION CAPS, and MAINTENANCE (CAP OF).

Capacity, LEGAL, means the power to alter one's rights or duties by the exercise of free will, or responsibility to punishment for one's acts. Civil capacity depends on Age (q.v.) and mental condition (see INSANITY). But civil incapacity is often imposed as a punishment on persons of full age and undoubted mental capacity. Convicts and persons attainted are placed under a general civil incapacity, and partial incapacities are also imposed as punishments—e.g. where a person is found guilty of bribery he becomes incapable of a certain public office. The English law of infancy, imposing a general disability to contract (except for necessities) on all men up to the age of 21, is not founded on physiological fact, and requires alteration. The disabilities attaching to married women have been largely removed by recent legislation in both England and Scotland. For supposed political reasons aliens were for a long time debarred from ordinary civil rights, and they are still properly excluded from political rights until they naturalise themselves and adopt the obligations of a subject. Different tests of capacity are applied to different transactions, as Contract (q.v.) and testament.

Cap-à-pie (Fr., 'head to foot'), in the military language of the middle ages, was applied to a knight or soldier armed at all points, or from head to foot, with armour for defence and weapons for attack.

Cape Breton, a rocky island of irregular form in British North America, at the eastern extremity of Nova Scotia, from which it is separated by the Gut of Canso, 1 mile broad. It has an extreme length of 100, a breadth of 85, miles; area, 4000 sq. m., with a population of 131,500. The coast is greatly indented with bays, and an inlet, the *Bras d'Or*, entering the island on the east, forms a lake (50 miles long, and 20 broad) which renders most of the interior accessible by water, and which, now continued by a ship-canal ($\frac{1}{2}$ mile) to St Peter's Bay, on the south coast, bisects the island. The climate is moist, but milder than that of the adjoining continent; the principal exports are timber, fish, iron ore, and coal. The island produces maize and

other grains, though not in sufficient quantities for home consumption. Originally a French possession, it was taken by the English in 1745; but being subsequently restored to France, it was again captured in 1758, and in 1819 became part of the province of Nova Scotia. The city of Sydney has 22,500 inhabitants, the town of Glace Bay 17,000; the once famous Louisburg, stripped of its fortifications, is now unimportant.

Cape Coast Castle, a settlement of Great Britain in the Gold Coast Colony, in Upper Guinea, 315 miles W. of Lagos. The place lies in a chasm, and, as its name implies, is defended by the great castle near the water's edge, and by three small forts on the hills behind, one of which serves as a lighthouse and signal-station. Ceded by the Dutch to the English in 1665, Cape Coast Castle, from 1672, was possessed by several British African companies till 1843, when it was taken over by government. In 1875 it was superseded by Accra as capital of the Gold Coast. The town has a trade in palm-oil. There is a telegraph line to Accra, and a fair road from Cape Coast to Prahsue (75 miles). L. E. Landon died here in 1838. Pop. 11,000.

Cape Cod, properly a narrow peninsula of Massachusetts, in form somewhat like the letter L, which, with a length of 65 miles, forms the south-east boundary of the great bay of that state. The northern extremity, marked by a revolving light 183 feet high above the sea, is in 42° 3' 40" N. lat., and 70° 14' 48" W. long. A ship-canal across the neck of the peninsula, 25 feet deep, and 250 feet wide, was constructed in 1910-13.

Cape Colony. See CAPE OF GOOD HOPE.

Capefigue, BAPTISTE HONORÉ RAYMOND, French author, was born at Marseilles in 1802, and in 1821 came from Aix to Paris to complete his juridical course, but from 1830 devoted himself to literature. He died 23d December 1872. Historian, antiquary, and politician, Capefigue was first and foremost a romanticist. The best of his works, which fill nearly a hundred volumes, was almost the first—*Histoire de Philippe Auguste* (1829).

Cape Gooseberry, a somewhat unfortunate name for the GOOSEBERRY TOMATO (*Physalis peruviana*), a South American solanaceous plant of the same genus as the Winter-cherry (q.v.). It has been introduced in South Africa and elsewhere. The large bladdery persistent calyx turns red, and encloses a yellow fruit from which a not unpleasant jam can be made.

Cape Haytién, or LE CAP, a seaport of Hayti, on its north coast, 90 miles N. of Port au Prince; pop. 15,000.

Cape Horn, &c. See HORN (CAPE), &c.

Capelin (*Mallotus villosus*), the only species of a genus belonging to the salmon family, and nearly related to the smelt. It is one of the smallest members of the family, lives on the sea-bottom off the northern coasts of the Atlantic, comes to the surface to spawn, and furnishes one of the most important parts of the cod's food in northern regions. Vast shoals occur periodically off Newfoundland, and are much used as bait in the cod-fishery. The capelin is eaten fresh in Iceland, and is sometimes imported in dried form into Britain. The flavour is pleasant, and suggests affinity with herring rather than with salmon.

Capell, EDWARD, Shakespearean commentator, was born near Bury St Edmunds in 1713. He was educated at Bury and Catherine Hall, Cambridge, and in 1737 was appointed deputy-inspector of plays, in 1745 groom of the privy-chamber. His official duties allowed him ample time for his favourite studies, which resulted in 1768 in his edition of Shakespeare in ten volumes, the work of twenty

years. In 1774 he published the first volume of his commentary, but this part was recalled, and the whole published in 1783, as *Notes and Various Readings to Shakespeare* (3 vols.). Capell lived a very secluded life at London and Hastings, and died early in 1781. The best portion of his fine library he bequeathed to Trinity College, Cambridge. He was an acute textual critic, though his abilities are spoken of with contempt by Farmer and Dr Johnson. Others again gave him the credit of many of the notes of Steevens.

Capella, MARTIANUS MINEUS FELIX, a learned author who flourished most probably in the second half of the 5th century, was born in the north of Africa. The work which has preserved his name to posterity is the *Satiricon*, a kind of encyclopædia, highly esteemed during the middle ages as a work of reference. It is written in a medley of prose and verse, and is full of curious learning. Of its nine books, the first two are an allegory, *De Nuptiis Philologiae et Mercurii*, while the remaining seven are devoted to the 'liberal arts': grammar, dialectic, rhetoric, geometry, arithmetic, astronomy, and music. A passage in book viii., that on astronomy, contains more than a hint of the true theory of the solar system. As Copernicus knew Capella, and quotes from him, it has been suggested that probably he derived the first idea of his doctrine from this writer.

Capella, a bright star of the first magnitude, on the left shoulder of the northern constellation of Auriga.

Capelle, EDUARD VON, German admiral, born in 1855 at Celle in Hanover, entered the navy office in 1891, and advocated naval expansion. He was under-secretary in 1913-16, and as secretary 1916-18, in succession to Tirpitz, was responsible for submarine policy.

Cape of Good Hope is not, as often thought, the most southerly promontory of Africa; in reality, it lies half a degree farther north than Cape Agulhas. The Cape (as it is called *par excellence*) is situated 30 miles south of Cape Town, in 34° 22' S. lat., 18° 29' E. long., and is the southern extremity of Table Mountain range and of the Cape Peninsula, which forms the western side of Table Bay in the north and of False Bay in the south. On Cape Point, a precipitous headland near the Cape of Good Hope proper, stands a lighthouse, 840 feet above sea-level. Rounded, perhaps, by the Phœnicians in their 'periplus,' c. 600 B.C. (see Herodotus's *Melpomene*), this 'southern point of Airic's coast,' as Camoens describes it in his *Lusiads*, was doubled and sighted by Bartholomew Diaz (q.v.) in 1487 or 1488—before Columbus, likewise seeking the Indies, but by a different route, discovered America. Fierce gales, such as kept the *Flying Dutchman* out of Table Bay, led the Portuguese mariner to dub the headland *El Cabo Tormentoso* (Cape Tempestuous); but his sovereign, John II., renamed it more happily *El Cabo de Boa Esperança* (Cape of Good Hope). In 1497 Vasco da Gama, following up Diaz's discovery, found his way to India *via* the Cape; in 1503 another Portuguese, Antonio Saldanha, landed in Table Bay and climbed the Mountain. Sir Francis Drake, homeward bound in 1580, doubled the Cape, 'the most stately thing and fairest cape we saw in the whole circumference of the world.' The opening up of this ocean-route to India transferred Eastern trade supremacy from Venice and the republics of Italy to the states of western Europe, made the Cape Peninsula a valuable half-way house, and led to the first European settlement in South Africa in 1652 by the Dutch. Thus this Cape gave its name to the Cape Colony, or Colony of the Cape

of Good Hope, since 1910 the Cape Province of the Union of South Africa.

The CAPE PROVINCE, largest and first settled of the colonies forming the Union, occupies the southern end of the African continent, extending eastward from 16° E. to beyond 30° E., and southwards from 25° S. to nearly 35° S.; its area is 277,000 sq. miles, about seven-twelfths of the total area of the Union. On the north-west it is coterminous with the mandated territory of South-west Africa; on the north with the Bechuanaland Protectorate; on the north-east with the Transvaal, Orange Free State, Basutoland, and Natal.

The coast, washed on the west by the Atlantic, on the south and east by the Indian Ocean, curves regularly, like the arc of a circle, with few promontories and inlets. The bays are mostly wide and exposed. The chief harbours are Table Bay (Cape Town), Simonstown on False Bay (the Cape naval station), Mossel Bay, Algoa Bay (Port Elizabeth), and Buffalo Harbour (East London), all on the south coast. Saldanha Bay (on the west coast), the best natural harbour, lacks fresh water; Knysna (S.), a timber port, is narrow of entrance; Port Nolloth (N.W.) ships Namaqualand copper; Port St John's (N.E.) serves Pondoland. Islands are scanty, small, and rocky. Chief among them are the Ichaboe or Northern group, off the coast of South-west Africa (these, with Walvis Bay, were Cape, not German, territory long before the war of 1914-18), and the Colonial group, scattered along the west and south coasts. Robben Island in Table Bay is a leper settlement; the other islands are uninhabited, but yield guano, seal-skins, and penguin eggs. Perennial rivers are few and non-navigable, with rapids and sand-bars. The most important, the Orange River (q.v.), which separates the Cape from the Orange Free State and South-west Africa, rises in Basutoland and dwindles as it crosses the continent to the sea. Other rivers are the Olifants and Great Berg River (west coast); Breede, Gouritz, Gamtoos (south coast); Great Fish and Great Kei (east coast). Intermittent streams are common in the wet season; rain hollows out deep *spruits* and *dongas*, and causes serious soil erosion. There are no real lakes, but variable *vleis* and salt-pans are formed by rain-water in shallow depressions on the coast and the inland plateaus.

The province consists roughly of an ascending series of plateaus. Beyond a narrow coast belt lies the first terrace (Coast Flats), 500 or 600 feet in elevation. Some 3 to 30 miles inland comes the lowest of several concentric chains of mountains—the Olifants-Drakenstein-Langeberg-Outeniqua ranges, through *kloofs* (ravines) in which rush the rivers of the 'Western Province.' North of the Outeniqua Mountains—midway along the south coast—lies the Little or Southern Karoo (1500 feet), cut off from the Great or Central Karoo, still farther north, by the Zwarteberg, with peaks from 6000 to 7000 feet in height. The Great Karoo (see KARROO) runs east and west for between 300 and 400 miles, and has an elevation of 2000 to 3000 feet. Between it and the Northern Karoo (3000 to 6000 feet), which contains the drainage basin of the Orange River, rises the steep escarpment of the Nieuwveld and Sneeuwbergen ranges, continued north-eastwards by the Stormberg and Drakensberg (or Quathlamba) Mountains, north-westwards by the Roggeveld Mountains. This curving watershed lies from 100 to 150 miles from the coast. Compass Berg, near Graaff-Reinet, in the Sneeuwbergen attains over 8000 feet.

Climate.—The Cape as a whole enjoys an excellent climate, eminently healthy for Europeans. The heat is tempered by cool sea-breezes, and made tolerable by altitude. The high, dry, sun-baked air of the plateaus works wonders with lung troubles.

The coast climate is moister and more equable than inland; in the drier midlands winter is colder, summer hotter; in the higher regions of the interior the extremes are still more marked. Winter (roughly April to September) is the rainy season in Cape Town and the south-western corner; in the eastern, central, and northern regions summer (October to March) brings the rains. The north-west (Namaqualand) is almost rainless; the north and central districts have an annual fall of 5 to 15 inches, the south coastal belt 15 to 25, and the extreme east (Transkeian Territories) 25 to 35 inches. The rainiest regions lie east of Cape Town (35 to 40 inches), round Knysna (40 inches), and along the Pondoland coast (50 inches). Prolonged drought at times afflicts the land. Snow is rare, save on the mountains, but hailstorms are frequent and destructive in summer. Frost is not uncommon inland, where the daily range of temperature is much greater than on the sea-board. The mean annual shade temperature is between 60° and 65° F. practically everywhere, except in the far north and extreme east, which are hotter; but whereas the daily range of temperature averages 17° in Cape Town and 14° in Port Elizabeth, it is as much as 30° in Aliwal North (180 miles from and 4300 feet above the sea) and Kimberley (340 miles inland, 4000 feet above sea-level). In January (the hottest month) the mean maximum temperature is 78·5° in Cape Town and 75° at Port Elizabeth and East London; 84° at Prince Albert (60 miles inland, 2100 feet above sea-level) in the midlands; 91° at Kimberley and 94° at Kenhardt in the north. In July (the coldest month) the mean minimum is 47° in Cape Town, 50° in Port Elizabeth and East London, 40° at Prince Albert, 37° at Kimberley, and 34° at Kenhardt. Cape Town basks in bright sunshine for an average of 7½ hours daily; Kimberley's average is 9½ hours (78 per cent. of the total possible).

Fauna.—The native fauna, formerly so numerous and varied, has been sadly reduced. The lion, the hippopotamus, the rhinoceros, the quagga, the giraffe, once common, have disappeared. Thanks to game preserves and stringent regulations, certain 'royal' or big game have been saved from utter extinction. A few herds of elephants survive in the Knysna forest and Addo Bush. Leopards (called 'tigers' in South Africa) still abound in hilly parts. The spotted serval (Cape Dutch *tijger bosch-kat*), the wild-cat, and the lynx (*rooi-kat*) are among the smaller felidae. Jackals and wild-dogs (Cape hunting dogs) ravage small stock. The *aardwolf* ('earthwolf') or *maanhaar* ('mane'), a kind of small hyæna, is accused of killing lambs, as are baboons, which in troops rob orchards and mealie-fields. There are no bears. Eland, buffalo, and zebra are all but extinct; these, with bontebok, blesbok, gemsbok, hartebeest, klipspringer, koodoo, rietbok, and wildebeest are protected. Over thirty species of antelope are found in South Africa; some, like the bontebok, are very scarce, others common, like the duiker and steinbok; they range in size from the foot-high blue-buck (*blaaubok*) and tiny klipspringer to the 1000-lb. eland and the massive koodoo. The gemsbok (*oryx*) and the vanished black wildebeest (gnu) figure in the Cape coat of arms. The springbuck still 'treks' or migrates, though no longer in the innumerable herds of yore. Among other characteristic animals—some peculiar to South Africa—may be mentioned the wart-hog, the *aardvark* or ant-bear, and the pangolin (scaly ant-eater); dassie (hyrax), Cape badger or ratel, *meerkat* (suricate or mongoose), *mushond* (polecat), golden mole, Cape mole (*blesmol*), elephant shrew, spring-hare (*Pedetes Capensis*). Insects and reptiles are all too plentiful. Locust swarms and white ants do much havoc. Among

venomous snakes are cobras and puff-adders. There are over a thousand species of birds in South Africa. Weaver birds, waxbills, lousies, and sunbirds are common; long-tailed sugar-birds haunt the Proteaceæ. The wild ostrich survives north of the Orange River. The Cape partridge and Cape pheasant are francolins. The secretary bird is peculiar to the country. The penguin, like the Cape fur seal, frequents the islands off the coast. For Cape fish, see under *Fisheries*.

Vegetation.—Owing to deforestation, bush-cutting, veld burning, and sheep-rearing, denudation through storm water, and other causes, South Africa has been undergoing a process of desiccation. Though better provided than the rest of the Union, the Cape is poorly timbered, fires and reckless felling having depleted already scanty forests. Only 1 per cent of the province is under indigenous forest; virgin timber is almost exhausted. The largest timber forest (area c. 120,000 acres) is at Knysna, in the middle of the south coast. Smaller patches occur on seaward mountain slopes and kloofs from north of Cape Town round to Natal. The trees are chiefly evergreen. Most valuable is the Clanwilliam cypress in the Cedarberg Mountains. Other useful woods—yellow-wood, stinkwood, sneeze-wood, &c.—are utilised for furniture, wagons, railway-sleepers, fence-posts, and similar purposes. The south-west corner of the Cape is scrubland—woodland vegetation with many proteas and shrubs, heaths, bulbous and tuberous plants. The south-eastern region (coast and Eastern Up-lands), with its summer rains, consists of grassland with thorn scrub (chiefly acacias, with aloes, euphorbias, and other succulents). The north-east coast is in the palm belt; the north-west coast is more or less sandy desert. The heart of the province is Karoo, a desert-like region devoid of trees and shrubs. Here mesembryanthemum, crassula, aloes, and other succulents prevail, with tuberous and bulbous plants; prickly pear has spread broadcast. Rain, like a magician's wand, transforms the dull, flat basin into a glorious glowing carpet (due to various marigold-like flowers called 'goudsbloem'). The Northern Karoo is a great, treeless, elevated expanse, dotted with flat-topped hills. It grows shrubs and bushes, and turns a magenta colour when the *Mesembryanthemum spinosum* is in flower. North of latitude 30° S. the Karoid plateau meets grassland (veld tufted with short, wiry grass), which stretches away to the Kalahari and Rhodesia. The Cape Peninsula is one of the richest regions in the world for flowers. On Table Mountain grow orchids (e.g. red and blue disas), watsonias, gladioli (e.g. the perfumed brown Afrikaner lily), ixias, nerines, anemones, and hundreds of beautiful flowers and heaths. Caledon (90 miles from Cape Town) boasts 300 or 400 varieties of heath, and its annual wild-flower show is unique.

Industries.—Farming is the chief industry, about a third of the male European population and the vast majority of the natives being engaged therein. Although mining products still account for the major share (in value) of South African exports, agricultural and pastoral produce has substantially augmented its proportion within the present century. Cultivated land, while extending, forms but a tiny fraction of the total farm-land in the province. The pastoral branch of the industry far exceeds the agricultural and horticultural side. The irrigated area is being increased by irrigation boards with the aid of government loans. Van Wyk's Vlei dam (Carnarvon district) and various Oudtshoorn works served as pioneers; more recent undertakings on a big scale are the Olifants River (Van Rhynsdorp), Kamanassie River (Oudtshoorn), Nels River (Oudtshoorn), and Sundays River

(Uitenhage) schemes. 'Dry farming' is also making headway in regions where the rainfall is scanty. Thanks to better implements, more scientific methods inculcated by the Union Department of Agriculture, and co-operation, notwithstanding locusts, East Coast fever, ticks, scab, drought, and the thousand and one enemies of the farmer, the country has been converted in a very few years from an importer to an exporter of many food-stuffs. (As an instance in point, the Union imported in 1913 over 20 million eggs; in 1921 it exported as many.)

Domestic Animals.—Sheep-breeding is the oldest and most general pastoral industry, few parts being unsuited thereto, although farms with abundant summer and winter natural grazing are exceptional. Sheep flourish on the Karoo vegetation, but have often to be trekked or driven to fresh pasturages. The native Cape sheep (Afrikander) is particularly coloured, has long lop-ears, a fat tail (6 to 10 lb. in weight), and wiry hair instead of wool. Merinos and other breeds were imported from Holland, France, and England, and wool began to be exported early in the 19th century. To-day it ranks next to gold among the Union exports. The quantity shipped in 1921 (230,422,000 lb.) was almost double the figure for 1910. Of this 95 per cent was grease wool, only 5 per cent. being scoured. The Cape restocked the Transvaal and Orange Free State after the Boer war in 1902, and (with 10,500,000 woolled and 3,000,000 other sheep in 1920) still owns half the sheep in the Union. Woolled sheep tend to increase, native sheep to decrease in numbers. Disease, drought, locust ravages, and the abattoirs severely reduced flocks after 1912, when there were 13,000,000 woolled and 6,000,000 other sheep. Scab, kraaling (enclosing in pens), and slovenly methods affect both quality and quantity of wool, and dirty wool has kept down prices. Jackals, the cause of kraaling, are being fought by fencing; scab is combated by compulsory dipping and quarantine, but trekking flocks spread infection. Over 5,000,000 sheep-skins were exported in 1920. A large import trade in mutton has given place since the Union to an export trade, which should grow as the non-woolled Cape sheep is improved by crossing with imported breeds. The Cape woolled sheep are inferior to Australian sheep, though good Cape stud flocks rival those of the Commonwealth. Sheep farms are very extensive, breeders in the Karoo owning as much as 20,000 to 50,000 morgen (a morgen equals 2.116 acres).

The ox in South Africa was long regarded not as so much butcher meat, but as a draught animal or—to the native—a unit of wealth and barter. Afrikander trek-oxen are unrivalled, but railways and motor-traction are putting many on the retired list, and farmers are now paying more and more attention to cattle for slaughter and dairy purposes. Drought, the Boer war (1899–1902), rinderpest, and other plagues combined to thin South African herds, and huge quantities of frozen meat were imported annually. In the first decade of the Union not only was Argentine beef 'frozen out,' but the foundation of an export trade was begun. However, after the Great War it was realised that the quality of South African beef must be improved ere it could gain a secure hold on the English market. By importing sires, improving breeds and feeding methods, a marked advance has been effected of late in the quality of Cape cattle, although in numbers a big drop was recorded (1,600,000 in 1920, as against 2,700,000 in 1911). Before unification (1910) a heavy importer of dairy produce, South Africa now supplies its own needs, and exports large quantities of butter and excellent cheese. Hides also form an important

export item (though bad branding too often lowers the value), and supply raw material to Cape tanneries and the active local leather industry. Friesland are favoured in the west, shortlions in the east. The Afrikander has a decided hump, large dewlap and long wide-spreading horns, yields poor beef, little (but rich) milk, and is a splendid draught animal. East Coast fever ravages natives' herds in the Transkeian Territories, otherwise excellent cattle country.

Ostrich domestication began about 1860, but little progress was made for another decade, when incubators were introduced. A 'boom' in the early 'eighties was followed by a ruinous slump. After the war of 1899–1902 prices soared anew, and by 1913 the domesticated birds numbered 757,000, having more than doubled in ten years. Then over-production provoked a fresh slump, which the Great War and vagaries of fashion accentuated. By 1920 flocks had been cut down to 277,000, only birds of superior plumage being preserved. In the record year 1913 over 1,000,000 lb. of feathers, valued at well-nigh £3,000,000, were exported from South Africa (practically all from the Cape). The average value per pound fell to 16s. in 1915, as against £5, 8s. in 1880. The chief ostrich districts are Oudtshoorn, Graaff-Reinet, and round about Grahamstown in the Eastern Province. The birds are kept in large fenced camps, or fed in paddocks on lucerne, to grow which irrigation has been freely adopted. The perfection of plumage through selective breeding, the absence of cruelty in clipping the birds, the virtual monopoly enjoyed and jealously guarded by South Africa, ensure the success, despite set-backs, of ostrich-farming in the Cape, whose two most valuable exports are (rather precariously) both articles of luxury and adornment—diamonds and feathers (see OSTRICH).

Angora goats were first imported from Asia Minor in 1838. The herds multiplied till, by 1912, the Angoras exceeded 3,668,000. Drought brought this total down by half in 1920. Exportation of mohair began in 1857, and in half a century rose to over 20,000,000 lb., valued at £1,000,000. South Africa supplies the major share of the world's needs in mohair; most goes to Bradford. Cape mohair is less fine than Turkish, but more attention is now being paid to stud flocks. Other goats are raised profitably for mutton and skins, especially in the dry north and north-west and districts where sheep do not thrive. Horses are not indigenous, but Arabs were introduced from Java in the 17th century. Soon horse-breeding was taken up; from 1769 onwards remounts were exported, and Cape racers became famous in India. The Karoo offers a favourable breeding-ground, but deadly 'horse-sickness' prevails in some regions, and 'salted' (i.e. immune through having had and recovered from the disease) and inoculated horses are in demand. Excellent mules are also bred for export, or to take the place of oxen when faster draught animals are needed. Asses are reared in Bechuanaland, and do well where horses cannot live.

Cultivated Plants.—Maize is the chief grain crop. Mealies, to use the Cape name, are the staple food of the natives, yield a more certain crop than other cereals, and have an unlimited market at home and abroad. Since 1907 a big export trade has been built up (in 1921, 1,000,000,000 lb. of maize and maize-meal were shipped from Union ports, valued at £5,000,000). The best Cape maize-region lies inland east of Port Elizabeth. By the erection of grain-elevators at the ports and in the maize-districts, production is being stimulated. Kaffir-corn (sorghums and durras), more suited to drier regions, provides the natives with food and drink (Kaffir beer), and is also used as fodder or for ensilage. Wheat grows well in some south-western

districts; oats are a more general crop, being sown largely for hay, and in poorer soil. Rye and barley are also produced. Malmesbury is the chief grain-district.

Tobacco (Virginian) for pipe-smoking and cigars has long been grown in Oudtshoorn and Stockenström districts in the east, Piquetberg in the west; since 1905 Turkish tobacco has been successfully introduced in the French Hoek and Drakenstein valleys near Cape Town, and colonial Turkish cigarettes have ousted the imported article. Wattles are planted in the Transkeian Territories, and their bark (yielding valuable tannin) is exported. Cotton, tried before in the eastern coast regions, is being experimented with afresh.

The country is highly favoured in the matter of fruit. The climate stimulates home consumption, and Cape soft fruit, reaching London in winter, has the market to itself. The first half of the year sees the deciduous fruit of the Western Province ripen—luscious peaches, plums, nectarines, apricots, pears, and grapes. The second half of the year brings the citrus fruits—oranges, naartjes, lemons—and pineapples of the Eastern Province, besides Stellenbosch strawberries. With figs, guavas, quinces, apples, loquats, Cape gooseberries, melons, and what not, these make the fruit season last the year round. Ever-increasing quantities are being canned and bottled, made into jam and jelly, or dried (peaches, apricots, and prunes; currants and raisins). The export trade, begun at the end of the 19th century, is expanding rapidly; additional cold-storage is demanded; and orange-growing in particular has attracted attention since the Great War ended.

The vine was introduced—for brandy—by the first Dutch settlers, and the wine industry, the pioneer industry of South Africa, was established by the Huguenots (1689) in and around Paarl and Stellenbosch. Wine-farmers prospered; Cape wines—especially Sweet Constantia (port)—won a name for themselves in England and Europe, and by the mid-19th century a big export trade was carried on. Nearly a million gallons were shipped in 1858. The withdrawal of colonial preference by the United Kingdom in 1860, the reduction of duties on French wines, the outbreak of phylloxera (1886), and the Cape farmers' fatal proneness to put quantity before quality combined to kill this flourishing export. The introduction of new stocks from America and better methods gradually improved matters, and good light wines (chiefly white) are now produced; half a million gallons were sent oversea in 1920, colonial preference having been restored. Brandy production has also greatly increased since the Union, and pernicious 'Cape smoke' or *dop* (brandy distilled from husks) is being driven out by excess excise duties. Raisins and currants and vinegar are also made, and delicious table grapes exported in huge quantities.

Minerals.—The discovery of diamonds (at Hope-town, on the Orange River) in 1867 altered the whole history of the Cape. Drought and depression threatened the land with bankruptcy when this unsuspected source of untold wealth was revealed. In like manner, some twenty years later, the shadow of disaster was dispelled in South Africa by the discovery of the Rand gold-mines. Diamonds, however, differ from gold in being a luxury, not a necessity with a standard value. Their price is liable to sudden and violent fluctuations. Only by carefully regulating the supply can high prices be maintained. Hence, not satisfied with amalgamating (1891) the Kimberley mines in the De Beers Consolidated Mining Company, which to-day controls practically the entire output of South African diamonds, thereby enjoying a world monopoly (Brazil and Belgian Congo stones are the only competitors of consequence), Cecil Rhodes founded the

London Diamond Syndicate (1893) to purchase all South African stones, and control prices and quantities put on the market. World crises always hit the diamond industry hard. The depression of 1907 in America and Europe reduced the output of Cape diamonds in value from six millions to three millions sterling. The outbreak of war in 1914 brought it down from seven millions (1913) to quarter of a million (1915). The post-war trade-slump and flooding of the market with stones sold by Russians and other ruined Europeans led to the temporary closing down of the Kimberley mines in 1921, and a drop from the record production of 1,364,706 carats, valued at £9,500,000 in 1920, to 238,470 carats, worth but £1,300,000 in 1921. The river diggings, which began in earnest at Klipdrift, near Barkly West, on the Vaal, in 1870, were soon completely overshadowed by the discovery of great diamond pipes in the dry fields, in the midst of which Kimberley (q.v.) rose like a mushroom. Primitive surface diggings in time gave place to open works 500 feet in depth and underground shafts six times as deep, costly machinery, and highly scientific methods of recovery. In 1920 over 31,000 men (10 per cent. of them white) were employed in diamond-seeking—half in Kimberley mines, and half in the alluvial diggings. Alluvial stones fetch two or three times as much per carat as the less pure mined stones; Cape mine stones are twice as valuable as Transvaal mine diamonds of the same weight. In 1919 alluvial stones touched the record price of 261s. 6d. per carat, as against 87s. 10d. for Cape mine stones (which before the war fetched about half that price). Alluvial stones represent approximately a tenth of the total South African production. In half a century (1870–1920) the Cape diamond output totalled roughly 100,000,000 carats, valued at £200,000,000, the record year (for weight, not value) being 1906, when 2,742,868 carats, worth £7,000,000, were exported. In 1917 an export duty was imposed on rough diamonds, with a view to transferring the lucrative industry of diamond-cutting to South Africa (see DIAMOND).

Copper, the first metal worked by Europeans in South Africa, ranks next to diamonds among Cape minerals. The only productive mines are in the north-west corner of the province, in Namaqualand, where ore was discovered as early as 1685. Working began in 1852 at Springbokfontein, and in seventy years copper to the value of some £20,000,000 was extracted (mainly by partial pyritic smelting) from the mines near O'okiep (mostly by the Cape Copper Company and the Namaqua Copper Company), and taken by rail to Port Nolloth, 90 miles away. Extraordinarily rich in the past, the first-grade ores were nearing exhaustion when the war began in 1914, and in 1918–19 the heavy drop in prices led to the suspension of productive operations. Copper also occurs at Mount Ayliff (East Griqualand) and in Hay, Gordonia, and Prieska divisions in the far north.

Asbestos has, since 1893, been produced in the Hay and Prieska districts, near the Orange River, and still farther north at Kuruman and Barkly West. The first thirty years of working the deposits yielded some £600,000 worth of asbestos, the output rising to 3000 or 4000 tons, valued at over £20 per ton. The Cape 'blue asbestos' (asbestiform crocidolite) fibre, at first viewed askance, is now acknowledged superior for the manufacture of certain articles.

Coal outcrops in the Stormbergen, and is worked chiefly at Indwe (Wodehouse), Engcobo (Tembuland), and Cyphergat (Molteno). This coal proved very useful in the early days of the diamond-mines and railway development. The output rose to 200,000 tons by 1900, but in the next twenty years shrank to 5000 tons. Yielding poor coal, and

expensive to work, the Cape mines cannot compete with other South African mines since opened, and now only supply local needs.

Gold has been found in different parts of the province, notably at the Millwood diggings (Knysna) and small mines near Mafeking, but the output is trifling. Tin (cassiterite) is worked at Kuils River (16 miles from Cape Town). Granite, iron ore, corundum, lime, salt (from 'pans') also contribute to the mineral production. Nickel occurs at Insizwa. Crocidolite (cat's eye, or hard *chatoyant* variety) is found plentifully at Naauwport, west of Kimberley, and is exported for jewellery purposes.

Fisheries, though fish abound along the coast, are not fully developed. The Agulhas bank is said to be one of the finest fishing-grounds in the world, sole being plentiful. Staple fish are silver fish, 'Hottentots,' pangas, red stumpnose; geelbek and kabeljauw (a kind of cod), both called 'Cape salmon,' and stockfish (hake) are migratory. Snoek (barracouta), once most common, is salted and sent to Mauritius. Steenbras (stone bream) is the biggest edible fish. Sharks abound. Crayfish swarm in Table Bay, and are now canned and exported in millions. Many rivers have been successfully stocked with trout. Cape whaling stations capture hundreds of whales yearly, and whale-oil is shipped to England. The government guano islands yield in good years as much as 10,000 tons of valuable guano, in great demand as a fertiliser; over 10,000 seal-skins have been secured in a season; and from Dassen Island 500,000 penguin eggs.

Manufactures, while increasing steadily, are yet comparatively unimportant. In 1920 3000 factories were in operation, employing 63,000 persons (mostly coloured); half of these worked in the Cape Peninsula, and one-tenth in Port Elizabeth, the only other industrial centre of note. Most of these industries are dependent for their raw materials on Cape farming, forestry, and fisheries—e.g. wine, brandy, jam, leather, and tobacco industries; wagon-building and furniture; fish-curing, crayfish-canning, whale-oil extracting. Other manufactures import raw materials to supply mines, railways, and farms with machinery, explosives, &c., or to satisfy everyday needs (tailoring, printing, chemical-works, building and contracting). The great mass of its manufactured articles the Cape still gets from overseas. There is a dynamite factory at Somerset West. Uitenhage has railway workshops and wool-washeries. As agriculture progresses, population increases, cost of living decreases, and transport arrangements are improved, local manufacturing industries are bound to take a fairer share in the country's development.

Communications.—Country roads are managed by the provincial administration, and divisional councils can levy local road rates. The mileage of main and other roads is rising rapidly; the ox-wagon still goes its leisurely way from outspan to outspan (untying-place), but the motor-car is invading even the back-veld. Bridges are superseding *drifts* (fords); several span the Orange River, linking the Cape and the Orange Free State. Railways have forced their way into the remotest regions of the province, ousting the 'kurveyor' or transport-rider. These are almost all Union government property. The first line, Cape Town to Wellington, 58 miles in length, was built in 1859-63, and was taken over by the Cape government in 1873. By 1883, thanks to the discovery of the diamond-fields, the Cape railway system had extended to over 1000 miles, a total which had quadrupled by 1915, when to facilitate military operations the line was carried across the Orange at Prieska and rapidly linked up with the railway in (then) German South-west Africa at Kalkfontein—a stretch of 315 miles across most trying

country. The main line from Cape Town reached Kimberley in 1885, Bloemfontein in 1890; two years later Johannesburg was connected by rail not only with Cape Town, but also with the rival ports, Port Elizabeth and East London. The 'Cape to Cairo' line pushed on from Kimberley to Mafeking in 1894, then crossed the Bechuanaland Protectorate and Rhodesia to the Belgian Congo, with Lake Tanganyika as next objective. Lateral railway extension (neglected in favour of lines from the coast to the inland mines) is now in full swing in the Cape Province. The only isolated line is the Cape Copper Company's track from Port Nolloth to O'okiep. Save in the case of a few private or branch lines the gauge is 3 feet 6 inches. The rivalry of Cape, Natal, and Portuguese East Africa ports, and the difficulty of adjusting satisfactory railway rates for the Rand traffic, long caused inter-colonial friction, but ultimately helped to hasten the Union of South Africa. The Union shipping line, which amalgamated with the Castle Company in 1900, carried the English mails from 1857. The first telegraph line (Cape Town to Simonstown) was opened in 1860. Cables of the Eastern Telegraph and associated companies connect the Cape with Britain, Australia, South America, India, and the Far East. Wireless stations have been erected at Slangkop (Cape Peninsula) and Port Elizabeth.

Administration.—The Cape Province consists of (1) the Province proper (including, for administrative purposes, Bechuanaland); (2) Transkeian or Native Territories (composed of East Griqualand, Tembuland, Transkei, and Pondoland); (3) Walvisch or Walvis Bay (q.v.). The Cape (with its Native Territories) elects directly to the Union House of Assembly fifty-one members, who, with the Cape provincial council, nominate eight members of the Union Senate. The chief executive officer of the province is an Administrator, appointed by the Governor-general in Council and aided by an executive committee of four, elected from and by the provincial council. This council, also consisting of fifty-one members, is elected for three years (by the Union parliamentary constituencies), meets in Cape Town—like the Union legislature—and passes ordinances dealing with purely provincial affairs, and taxation therefor—e.g. school education (till assumed by the Union Parliament), hospitals, municipal institutions and divisional councils, roads, bridges, markets, fish and game preservation. In the Cape, more advanced than the rest of the Union, there is no colour bar as regards the franchise, and non-whites may be—and are—elected to the provincial council. All national affairs are under control of the Union parliament. (See SOUTH AFRICA.)

Local Government.—The Province proper is partitioned into some ninety fiscal divisions (of unequal extent) under divisional councils, which manage local roads, bridges, rating, public health, &c. Instituted in 1855, these councils control rural affairs, and do not exist in the other provinces of the Union. There are 120 municipalities in the Province proper, and 7 in the Native Territories. Some of these are tiny *dorps* of but 500 or 600 inhabitants, white and coloured. Smaller local units are under village management boards.

Herschel division, next Basutoland, is administered by a magistrate under the Native Affairs Department, as is Glen Grey (adjoining the Transkeian Territories), which, like nearly all districts in the territories, has also a district council, consisting of native members with the resident magistrate as chairman. Representatives of the district councils in the Transkei, Tembuland, and East Griqualand unite annually in the Transkeian Territories General Council, with the chief magistrate as pre-

sident; those in Pondoland unite in the Western Pondoland General Council. These councils are advisory, and give natives a voice in such matters as education, roads, public health. The Union Native Affairs Act of 1920 provides for the extension of this system of local native councils, first introduced by Rhodes's Glen Grey Act (1894).

Population.—The following table gives the total population and the white population of the Cape Province and its component parts at the 1921 census:

	Area, sq. miles.	White Pop	Total Pop	Total 1911
Cape Province proper	209,661	612,706	1,693,958	1,568,150
Bechuanaland	51,524	20,642	110,678	99,553
Transkeian Territories	(16,951)	(14,726)	(968,131)	(894,186)
East Griqualand	6,602	6,252	264,786	243,222
Tembuland	8,339	4,695	235,479	227,432
Transkei	2,504	2,278	197,911	188,895
Pondoland	8,906	1,500	264,955	234,687
Walvis Bay (and Travellers)	480	2,420	4,398	3,076
Cape of Good Hope	276,966	651,554	2,781,185	2,564,965

(1) **White Population.**—The 1921 census thus recorded a total population of 2,781,185, of whom 651,554 were European or white. When the first census was taken in 1865, the whites numbered 132,000; by 1891 this figure was doubled; the 1911 total was 582,000. The European inhabitants are outnumbered by more than three to one. They are divided among themselves into two sections, whose mother tongue is English and Dutch or Afrikaans respectively (many are bilingual, especially those of Dutch descent). Eight out of nine are African-born (Afrikaners); immigration proceeds slowly. Immigrants from Europe are generally townsmen; Dutch Afrikaners or Boers are mostly farmers. Males outnumber females, but the margin is no longer great. More than half the whites attend Dutch churches; Anglicans come next in numbers, then Methodists, Presbyterians, Roman Catholics, and Jews. There is no state church. Dutch colonials predominate in the rural districts, English in the larger towns. Cape Town, Port Elizabeth, Kimberley, and East London are the only urban areas with over 10,000 white inhabitants; except Grahamstown, King Williamstown, Oudtshoorn, Paarl, Queenstown, and Uitenhage, other towns have less than 5000 Europeans. *Dorps* (villages) are scattered broadcast.

Education.—Higher education is controlled by the Union government. Since 1918 Cape Town and Stellenbosch (a Dutch divinity and law centre) have universities; Huguenot University College (Wellington) and Rhodes University College (Grahamstown) are among the constituent colleges of the University of South Africa (which succeeded the examining University of the Cape of Good Hope). School education remains under provincial control till the Union parliament decrees otherwise. In the Cape the schools for white children are under local school boards; between seven and sixteen (or till Standard VI. is passed) education is compulsory; primary education up to Standard VI. is free. The percentage of attendance (over 90) is high, considering the distances involved.

(2) **Coloured Population.**—The other-than-white or non-European population—2,130,000 in 1921—consists of Bantu and other natives, Euraficans and others of mixed race, and Asiatics. Half the coloured population live in the Cape Province proper, half in the Transkeian Territories and Bechuanaland, the addition of which to the old Colony profoundly altered the ratio of white inhabitants to coloured. In the Province proper there are three Europeans to every five non-Europeans; in the

Territories natives outnumber whites by sixty-eight to one. More prolific, the natives are increasing faster than the white inhabitants. No longer decimated by inter-tribal wars and wars with Europeans, the Bantu, instead of disappearing like the coloured races of other British Dominions, multiply at a rate which complicates the already intensely difficult native problem of South Africa. With the introduction of better hygiene, and the reduction of the high infantile mortality rate, this tendency to outdistance the white population will be accentuated, failing a heavy influx of white settlers from overseas.

The Cape natives are nearly all Bantu of various nations. In the east (Transkeian Territories) are Xosas, in the north Bechuanaas. The chief tribes of the Ama-Xosa (*Ama*=people of, men of) are the Ama-Mtembu (Tembus or 'Tambookies'), the Ama-Gcaleka (Galekas), the Ama-Rarabe (including the Gaikas or Ama-Nguika), and the Ama-Mpondo (Pondos). According to tradition, Zwide (fl. 1500) had three sons, Mtembu, Xosi, and Mpondo, who divided their father's tribe and founded separate branches of the Ama-Xosa. These made their way southwards from the lake regions of Central Africa, and reached the Kei River before the end of the 17th century. The brothers Gcaleka and Rarabe were descendants of Xosa, and their tribes figured most prominently in the border wars of the 18th and 19th centuries. The Tembus farther inland, and the Pondos farther up the east coast, suffered severely at the hands of Tshaka and his merciless Zulu *impis*. The Ama-Fengu or Fingoes ('wanderers') were also victims of Tshaka, being driven from Natal, scattered, and forced to seek refuge among the Xosas. The Xosa yoke they found so heavy and galling that from 1834 they threw in their lot with the British in the Kafir wars, and some were settled within the bounds of the Cape Colony. The Fingoes served as a sort of buffer between their white allies and their Xosa foes. Still viewed somewhat askance by their fellow-blacks, the Fingoes have, as a rule, shown more aptitude for education and European civilisation than the other Bantu tribes of the Cape.

Before the Ama-Xosa took possession of the Transkeian Territories another group of Bantu invaders from beyond the equator had established themselves in the interior, in the north—the Bechuana. In that part of Bechuanaland which is included in the Cape of Good Hope (British Bechuanaland—as distinguished from the Bechuanaland Protectorate) the Bechuana nation is represented mainly by the Batlaping and the Barolong tribes. The Batlaping followed the Bakalahari south into the central plateau and drove them into the Kalahari desert, and then in turn were ousted by the Barolong. Moffat opened a mission-station at Kuruman among the Batlaping. Lacking the bravery of the Xosas and the Zulus, the Barolong were terrorised by Mosekatse and his Matabeles. Montsioa of Mafeking, the Barolong chief, fearing Transvaal aggression, appealed for British protection, which followed Sir Charles Warren's expedition of 1884-85, thus keeping open for the British Empire the road to the hinterland of South Africa, to which Cecil Rhodes's far-seeing eyes were turned.

Natives other than Bantu include Hottentots, such as the Namaquas and the Korannas, and a sprinkling of Bushmen in the remote north-west (Bushmanland). Griquas (Hottentots of mixed descent, with an infusion of European blood) fled north to escape from the early Dutch settlers at the Cape, and installed themselves near the junction of the Orange River and Vaal (Griqualand West). Hence, owing to difficulties with the Orange Free State, Adam Kok and his Griquas were transferred by Sir

George Grey in 1861 to Griqualand East, between Pondoland and Basutoland.

About a fifth of the non-European population is of mixed race. Eurafrians—or 'coloured people,' as they are often called, in contradistinction to natives and Asiatics—are chiefly congregated in the Cape Peninsula and south-western districts and in the larger towns. Very few are found in the Native Territories. Asiatics, who number several thousands, comprise chiefly (1) virtually indigenous Malays, resident in the Cape Peninsula, descendants of slaves introduced by the early Dutch settlers; and (2) Indian immigrants. Chinese have been excluded since 1904, and as the Union Immigration Law admits from overseas no male Asiatics over sixteen, this section of the community is dwindling.

Religion and Education.—Of the non-European population nearly half (including practically all those of mixed race) are classed as Christian. Among the Bantu the Wesleyan Methodists have most adherents; among the 'coloured people,' the Dutch and Anglican Churches. The separatist African Methodist Episcopal or Ethiopian Church makes marked headway. The first mission sent to South Africa was Moravian (1737); the pioneer Moravian station, Genadendal, some sixty or seventy miles east of Cape Town, dates from 1792. The London Missionary Society entered the field soon afterwards; John Philip, John Mackenzie, the Moffatts, Livingstone, among others, worked for this society, especially among the Bechuana. James Stewart made Lovedale (q.v.) pre-eminent in South Africa among institutions providing 'higher education' to the native. For long native education was left entirely to missionary effort. White and coloured pupils have separate schools. There are now over 2000 state and state-aided schools for coloured children in the Cape, with some 150,000 scholars (two-thirds being Bantu). About one-tenth of the natives can read and write, and about a fourth of the mixed coloured population. The Territories evince a growing desire for secular schools. To satisfy demands for higher education for non-Europeans the South African Native College was opened in 1917 at Fort Hare, near Lovedale, in Victoria East division. This is intended to provide coloured students of all races with education of university standard, and train them for the learned professions and higher branches of agriculture, commerce, &c. Natives already range in civilisation from raw savages to university graduates and accomplished newspaper editors, publicists, preachers, and teachers, and the whole question of native education, higher and elementary, is one of the most difficult South Africa has to solve.

History.—The history of Cape Town was long the history of the Cape; the history of the Cape was long that of South Africa—indeed, the two terms are still often used synonymously. Three coloured races and three white races have in turn played their part in the story. The original inhabitants, the Bushmen (or *Sana*), dwarfish hunters, fleet of foot, skilful with bow and poisoned arrows, retired before the dumpy Hottentots, but left behind them remarkable drawings on the walls of caves—the earliest extant Cape records. The Hottentots (*Khoi-khoi* = men of men), nomad pastoral tribes, were in possession when the first white men arrived in Table Bay. Down on these primitive inhabitants swept Bantu hordes from the north—the so-called Kaffirs who now constitute the native population of the Cape. Squeezed between white invaders advancing from the south-west, and black invaders encroaching from the north-east, the yellow-skinned Hottentots and Bushmen had no chance; to-day pure specimens of these races are very rare, and are to be found

only in remote Namaqualand or the Kalahari desert. The Bantu were superior not only in numbers, but in physique and civilisation, being agriculturists and artisans as well as warriors.

The Portuguese discovered the Cape; the Dutch colonised it; the British conquered it. No attempt to occupy South Africa was made by the Portuguese. Diaz, Da Gama, Saldanha came and saw—and departed. Diaz landed in Algoa Bay (Algoa means 'to Goa,' just as Delagoa means 'from Goa') in 1487-88; Vasco da Gama anchored in St Helena Bay and Mossel Bay in 1497; Saldanha entered Table Bay in 1503. But the death of D'Almeida, Viceroy of India, in 1510, at the hands of Hottentots near Table Mountain, gave the Cape a bad name, and made the Portuguese confine their attention to East and West Africa.

The foundation of the English and Dutch East India Companies (1600, 1602) opened a new chapter in Cape history. Dutch and English Indianen regularly put into Table Bay for water, and to leave and take up letters hidden near inscribed 'Post-office stones.' In 1620 Captains Fitzherbert and Schillinge hoisted the English flag on Signal Hill (at the foot of which Cape Town was to arise), and annexed 'the whole continent near adjoining' in James I's name. Unfortunately their act was never ratified, and it was left to the Dutch to establish the first European colony in South Africa. In 1652 the worthy Johan van Riebeeck, a surgeon, founded Cape Town for the Dutch East India Company, as a station where their ships could get fresh meat and vegetables, and their sick receive attention. Steadily the station grew in population and area under a succession of governors, most notable among whom was Simon van der Stel. During his régime (1679-99) agriculture and tree-planting were encouraged, Government Avenue and Gardens were laid out, the Namaqua copper mountains were explored, Stellenbosch was founded, and a couple of hundred Huguenot refugees were settled (1688-90) in and around French Hock. These new-comers made an appreciable addition to the European colony; they promoted viticulture; and, though they had to give up their French tongue, they founded some of the most outstanding and enduring families of South Africa (e.g. De Villiers, Malan, Marais, Joubert). Under Adriaan van der Stel, who succeeded his father as governor, discontent shook the settlement, and he was recalled by the company in 1707. Many Asiatic and African slaves had been imported, and half-castes of all shades—'Cape people'—were added to the community.

Penetrating ever farther inland, the pioneers came more and more in conflict with Hottentots and Bantu. Smallpox, which ravaged the Colony in 1713, swept away many surrounding Hottentots, and their territory was taken over by the white settlers. Under Swellengrebel, the first South-African-born governor, Swellendam was founded (1746). In 1756 the white population, swept afresh by smallpox, numbered little over 5000. The governorship of 'Father' Tulbagh (1751-71) ushered in what has been called the Golden Age of the Cape. Such were the growth and display of wealth that sumptuary laws had to be imposed. By 1770 the white population had risen to 10,000. Cape Town gave itself airs as the 'Paris of the South.' The declining Dutch East India Company's selfish and repressive rule, however, drove many settlers to trek inland. In the north the Orange River was explored, and named after the Stadhouder of Holland. The Fish River was declared (1778) the eastern boundary, and Kaffir wars ensued (1779, 1789). War between Britain and Holland (1780) added new complications, and gave the finishing blow to Dutch East India Com-

pany rule. The States-General of Holland, taking over the government of the Colony, sent out a commission of inquiry. When the Prince of Orange fled to England and the Batavian Republic sided with France, a British force in 1795 occupied the Cape. Liberty was extended and prosperity restored ere it was handed back to the Dutch in 1803, after the Peace of Amiens. For three years wisely administered as a Netherlands colony, and no longer exploited by a grasping company, the Cape was soon to pass once more into British hands—this time for good. Hostilities were renewed between Holland and Britain. A British force under Sir David Baird landed in Table Bay, and at Blaauwberg, 18 miles from Cape Town, defeated a motley Dutch army, under General Janssens, on 8th January 1806. Cape Town capitulated, and in 1814 British possession was finally recognised by the Netherlands, which received £6,000,000 in return for this and other territory. When the Cape was thus permanently ceded to Britain, the population of the Colony consisted of 26,700 whites, 29,000 slaves, and 18,000 free Hottentots.

Cape Colony, 1807–1910.—The clash of races provides the *motif* of Cape history in the 19th century; the conflict of black and white, of white and white, of black and black explains most of the failures and successes of the Cape of Good Hope from its inception as a British crown colony in 1807 till it was merged in the Union of South Africa in 1910 as an original province thereof. Six Kaffir wars (1812, 1818, 1835, 1846, 1850, 1877) were waged on the eastern frontier of the Colony, where Grahamstown became the military headquarters; the home government vacillated in policy, the pioneer settlers suffered severely, but the bounds of the Colony were pushed ever farther east. Outstanding events of this protracted strife were the landing of 5000 British immigrants (the 'Albany Settlers') at Port Elizabeth in 1820—the nucleus of that portion of the Colony which became known as the Eastern Province as distinguished from the Western Province, whose *point de départ* was Cape Town; the great Kaffir Rebellion of 1850–53; the wholesale killing of their own cattle and neglecting of their fields (1857) by Xosas deluded by a witch-doctor's predictions of a kind of Kaffir millennium—this led to the depopulation of Kaffraria by starvation or migration and its repopulation by whites (including many Germans), the rise of East London and King Williamstown, and the incorporation in the Colony of British Kaffraria—between the Keiskama and Kei rivers—in 1865, another stage in the *Drang nach Osten*, which ended only in 1894 when Pondoland became part of the Colony, and the last gap between the Cape and Natal was closed. Since 1877 the history of the Cape has, compared with some of its neighbours, been singularly free of native risings. This may be attributed to its more generous native policy. Among the first acts of the British administration were to prohibit the slave trade (1807), to emancipate those in the Colony (1834), and to put all free coloured people on a level politically with Europeans (1829)—the native *Magna Carta*, as it has been called. Cecil Rhodes advocated 'equal rights for all civilised men south of the Zambesi' regardless of colour, and his extension of a measure of self-government to the Native Territories, by the Glen Grey Act (1894), made for peace between black and white, and set an example to South Africa as a whole.

While black struggled desperately with white in the east white contended bitterly with white in the west. British rule inevitably roused Boer discontent. Conservative and jealously independent, the descendants of the first Dutch settlers resented not only the arbitrariness of imperial governors and the ignorance of a remote British

government, but salutary reforms as well. The new régime enforced gentler methods of treating the native, freed slaves with inadequate compensation and disastrous results to their owners, imposed English as the official language (1828: Dutch was not recognised in the Cape parliament till 1882), substituted civil commissioners and resident magistrates for *landdrosts* and *heemraden* (1828), and so inflamed Dutch indignation that an abortive rebellion took place in 1815—its stern suppression at Slachters Nek causing much bad blood for generations to come—and twenty years later 10,000 *voortrekkers* set off heroically, in bullock-wagons, to find freedom in a new world beyond the Orange River. This Great Trek (1835–38) led to the foundation of Boer republics in Natal, the Transvaal, and the Orange Free State. When Natal was proclaimed British in 1843 racial bitterness became still more intense, and a new grievance was created for the Dutch colonists—the non-possession of a sea-board. In the Cape itself Anglo-Dutch rivalry was largely a question of east (predominantly English-speaking) versus west (still mainly Dutch-speaking), of town versus country; in South Africa it was a question of British coast colonies versus inland Boer republics. The discovery of diamonds in 1867 introduced a new line of cleavage; mining displaced farming as the 'backbone' of the country. The diamond-fields meant men and money to the Cape. These came from Europe. The Dutch Afrikaner chafed at this invasion, which he was powerless to stop—and by which he was soon to profit. The mines gave the agriculturist not only markets but railways far sooner than otherwise they would have come; the mining industry relieved the farmer of taxation which otherwise he would have had to bear. Nevertheless the new-comers (by no means free of undesirables) were stamped as *Uitlanders* (foreigners) or *verdoende rooimels* ('damned rednecks', from their ruddy complexions), and new elements of dispeace were let loose in South Africa. Unite or fight was soon the fateful choice before the four states. Lord Carnarvon's federation scheme in 1875 proved premature, like that of Sir George Grey in 1858. Only after the ordeal of two wars was Union to be achieved. The Boer war of 1880–81 ended in the recognition of the independence which had been taken away from the Transvaal (q.v.) in 1877. The Afrikaner Bond, a political organisation formed in the Cape in 1881, constituted a pan-Boer focus and fostered the racial antagonism which, accentuated by the Jameson Raid in 1895–96, again convulsed South Africa in the war of 1899–1902. Some Cape colonials sided actively with the republics, the Colony was invaded in the north, and the sieges of Kimberley and Mafeking ranked among the most memorable events of the war.

But differences were not confined to those between black and white, Boer and Briton. When the governor was not at loggerheads with Downing Street he was often at variance with the Cape colonials. South Africa was the 'grave of reputations' for civilian administrators and soldiers alike. Cape Town discovered that, if its citizens combined, it could at times overrule the governor and even defy Downing Street. Thus John Fairbairn and Thomas Pringle, the poet, secured the freedom of the press despite the efforts of Lord Charles Somerset (governor, 1814–26) to suppress it. Thus, too, the colonists, by agitation and passive resistance (1848–49), defeated the British government's attempt to make the Cape a penal settlement. Among notable governors who followed Sir Charles Somerset were Sir Harry Smith (1847–52), Sir George Grey (1854–61), Sir Bartle Frere (1877–80), Sir Hercules Robinson (1881–89; again as Lord Rosmead, 1895–97), Sir Alfred Milner (1897–1901), and Sir Walter

Hely-Hutchinson (1901-9). The Cape governor also held the office of High Commissioner for South Africa (created 1878) till 1900.

Natal formed part of the Cape Colony 1844-56, as did Basutoland from 1871 to 1883. Permanent annexations which added greatly to the Colony were British Kaffraria (1865; a British province since 1847), Transkei and Griqualand East (1879), Griqualand West (1880), Tembuland (1885), Pondoland (1894), and British Bechuanaland (1895). In 1834 the first step towards self-government was granted by the institution of a legislative council including nominated colonists, to work with the governor and a small executive council (Council of Advice). Twenty years later representative government was conceded; two elected houses were set up—a Legislative Council and a House of Assembly, but the executive council was nominated in London as before. Responsible government was not introduced till 1872, Sir John Molteno being the first prime-minister (1872-78). Eleven more ministries filled the period till Union in 1910, including those of Sir Gordon Sprigg (1878-81; 1886-90; 1896-98; 1900-4), Cecil Rhodes (1890-93; 1893-96), W. P. Schreiner (1898-1900), Dr Jameson (1904-8), and John X. Merriman (1908-10). While eschewing ministerial rank, J. H. Hofmeyr ('Onze Jan') dominated the Afrikaner Bond till his death in 1909. 'Dr Jim' was leader of the (English-speaking) Progressive or Unionist Party; the veteran Mr Merriman, who had been a member of the first Cape cabinet as he was of the last, led the South African Party (mainly Dutch). It was only fitting that the movement which ended in the Union of South Africa (1910) and the combining of the Unionists with the South African Party under General Smuts (1920) should have been initiated by the mother colony of the sub-continent, when, in 1907, the Cape parliament passed a resolution advocating closer union.

For Cape history, see works by Leibbrandt, Theal (1907-20), and Cory (1910 *et seq.*); for commerce, resources, &c., Playne's *Cape Colony* (1911); for the diamond-fields, volumes by Gardner Williams (1903), P. A. Wagner (1914); for the Transkeian Territories, a book by C. C. Henkel (1903); for natives, S. M. Molema's *The Bantu Past and Present* (1920), Dudley Kidd's *Essential Kaffer*, and the South African Native Races Committee reports (1901, 1908); also Lady Anne Barnard's *South Africa a Century Ago* (1901), and Olive Schreiner's *Story of an African Farm* (1883). Further relevant information will be found in this work in the articles AFRICA, BASUTOS, BECHUANALAND, BOERS, CAPE TOWN, DIAMOND, GRIQUALAND, JAMESON (SIR L. S.), KAFFIRS, KIMBERLEY, NATAL, ORANGE FREE STATE, OSTRICH, RHODES (CECIL), SOUTH AFRICA, TRANSVAAL, WALVIS BAY.

Capercailzie, or CAPERCAILLIE, also called Wood-grouse, or Cock of the Woods (*Tetrao urogallus*), the largest of the game birds of Europe, is a species of Grouse (q.v.), almost equal in size to the turkey; the male, which is about a third larger than the female, sometimes weighing fifteen pounds or more. In figure and appearance it much resembles the blackcock, but the male has a rounded, not forked, tail, and elongated head-feathers. The general colour of the adult male is brownish-black, minutely freckled with grayish-white and with lighter brown; the quill-feathers dark brown; the tail-feathers nearly black, some of the longer tail-coverts on the sides of the tail tipped with white; the chest is of a shining dark green; there is a small scarlet patch of naked skin above the eye, and the bill is whitish. The general colour of the female and of young males is dark brown, freckled with yellowish-brown; the front of the neck and the chest are yellowish-chestnut; and the feathers of the under parts are generally edged with white. The feet are feathered to the toes, but these are naked. It is an inhabitant

of pine-woods; feeds on berries, seeds, worms, insects, &c., and on the young shoots of the Scots pine, which it greatly prefers to the spruce; occasionally also eating, at least in winter, the buds of the birch and other trees. The females and young feed largely on insects and worms. The female makes her nest on the ground, and lays from six to twelve eggs, of a pale-reddish or yellowish brown, spotted with other shades of brown, and more than two inches long. The young birds keep by the mother till winter. Like the blackcock, the capercailzie is polygamous. In

Capercailzie.

spring the males indulge in untiring love-song, and in grotesque play to attract the females. Fights between rival males are of common occurrence. The geographical distribution is very extensive: it is found on the pine-covered mountains of all parts of Europe, from Spain and Italy almost to the North Cape, and is abundant in the northern parts of Asia. It was at one time found both in Scotland and Ireland, but was completely extirpated about the end of the 18th or beginning of the 19th century. Through the exertions, however, of the Earl of Fife and other proprietors of great Highland estates, but particularly of the Marquis of Breadalbane, it was restored to the forests of the Highlands of Scotland. It is very capable of domestication, and breeds readily if allowed the range of a space containing pine-trees. It is much esteemed for the table, and is imported from Sweden. See Brown's *Capercailzie in Scotland* (1879), and J. G. Millais, *British Game Birds* (1909).

Cape River, or RÍO DE SEGOVIA, or COCO (properly *Vauvau* or *Wauwau*), a river of Nicaragua, follows a generally north-east course of nearly 300 miles to the Caribbean Sea, forming part of the boundary between Honduras and Nicaragua.

Capernaum, was in the time of Christ a prosperous city of Palestine. Though called 'his own city,' it was one of the three which he upbraided 'because they repented not.' The site of the place is in dispute. It has been given as Khan Minia beside the spring Et Tineh, on the north-east corner of the plain of Gennesareth. The site generally accepted, however, by pilgrims and travellers from the 4th century onwards is at Tell Hum or Telhum, a ruined village with traces of a great synagogue, on the north-western coast of the Sea of Galilee. The name Tell Hum or Telhum is held to be a common linguistic corruption of Tankhum. A village of that name (Kaphir Tankhum) was closely identified with Kaphir Nakhum, the traditional tomb of the prophet Nahum. Hence the connection between Tell Hum and Capernaum, or 'village of Nahum.'

Capers are the pickled flower-buds of the caper-

bush (*Capparis spinosa*). They have an agreeable pungency of taste, with a slight bitterness, and have long been in very general use as a condiment and ingredient of sauces, along with boiled mutton, &c. They are of a grayish-green colour, to improve which copper is sometimes used; this, however, as in the case of other pickles (see ADULTERATION), renders them poisonous.—The Caper-bush is a native of the Mediterranean countries, and is cultivated in some parts of the south of France and in Italy, but most of all in Sicily. It succeeds in the open air even at Paris, but in Britain requires the aid of artificial heat. It is a trailing, rambling shrub, loving dry places, and often growing on rocks or walls. It begins to flower early in summer, and continues flowering till winter. The buds are gathered every morning, and are immediately put into vinegar and salt; at the end of the season they are sorted according to their size and colour (the greenest and least expanded being the best). The fruit is also pickled in the south of Italy, and in other countries both the buds and fruits of different species are used in the same way. Various substitutes for capers are sometimes used, as the flower-buds and unripe fruits of the Indian Cress (*Tropaeolum majus*), those of the Bean Caper (*Zygophyllum Fabago*), and it is said even 'the buds of the Marsh Marigold (*Calitha palustris*).—The Cape Tree (*Capparis Jamaicensis*), of the West Indies, South America, and Florida, is a small tree with a very hard wood.

Capet, HUGO, founded the third Frankish dynasty in 987. The name has been derived from *cappa*, the 'monk's hood,' which he wore as lay abbot of St Martin de Tours. Soon after the rise of the Capetian dynasty Paris became its capital. With the House of Capet the history of France may be said really to begin; and it ruled France till 1328. See FRANCE.

Cape Town, mother city of South Africa, capital of the Cape Province, seat of the legislature of the Union of South Africa, is situated between the north base of Table Mountain and Table Bay, in 33° 56' S. lat., 18° 29' E. long. The view of the city from the bay, with the steep and massive mountain close behind it, is most imposing. No less striking is the prospect of Table Bay and Cape Town from the mountain, villas and gardens and vineyards straggling up towards the pine and oak and silver tree plantations which clothe the lower slopes. The Table proper (3582 feet; 2 miles long) often has its top covered by the south-east wind (the 'Cape Doctor') with a rolling mass of white cloud—the 'table-cloth'; it is joined by the Saddle to Devil's Peak (3300 feet) on the NE., and by Kloof Nek to Lion's Head (2100 feet) on the NW.

For long after the landing of Van Riebeeck in 1652, the history of Cape Town (*Kaapstad*) and that of the Cape Colony were identical (see CAPE OF GOOD HOPE). The town was laid out by its Dutch founders with mathematical preciseness, the main streets intercrossing at right angles. The houses of old Cape Town are mostly flat-roofed, oblong, and whitewashed. Church towers and mosque minarets rise here and there, in this motley metropolis, with an occasional factory chimney to show the encroachment of industry. In the heart of the city lie the rich and beautiful Municipal Gardens. Alongside these runs, for three-quarters of a mile, a fine old oak avenue. On its western side is Government House, a heavy, irregular building, commenced c. 1740. The Houses of Parliament (opened in 1885; extended in 1910 for the Union legislature), the South African Public Library (founded in 1818), St George's Cathedral and Grammar School, the Supreme Courts, and the dozen Dutch Reformed Church (with an early

18th-century clock tower) are clustered about the entrance to Government Avenue; near its top end are the South African Museum and Art Gallery, and the South African College (1829), merged in the university of Cape Town in 1918. Adderley Street—the old Heerengracht—Cape Town's chief thoroughfare, prolongs the line of the Avenue to the shores of Table Bay, and ends in a pleasure-pier. Outstanding edifices in Adderley Street are the Railway Terminus, the General Post Office (where the wild-flower sellers display their lovely wares), and the Standard Bank. Elsewhere notable buildings include the City Hall, opened in 1903; the Old Town House (1755), now holding the Michaelis Art Collection; the quaint old Koopman De Wet house, to-day a museum of Cape furniture, &c.; the Opera House; and the Royal Cape Observatory, instituted in 1820. From Adderley Pier an esplanade stretches southwards on reclaimed ground towards the Castle, which, erected in 1666–80, is the oldest building in South Africa of European construction, and is still intact with its ravelins, glacis, ditches, sally-port, &c.

The earliest conception of the Dutch in settling at the Cape was to make it a place of call for passing vessels. Despite the Suez Canal route, Cape Town, besides being the 'Gateway of South Africa,' is still a 'Tavern of the Seas,' a half-way house on the road to India and Australia. The docks were opened in 1870, the graving-dock in 1882; the breakwater is 3640 feet in length. The dock property covers over 240 acres, and much of the work was done by convict labour. Table Bay Harbour is owned and managed by the Union government. Principal port of the Union, Cape Town handles well over half the country's exports and more than a quarter of its imports.

The population of Cape Town, when it finally became British in 1806, totalled some 6000 or 7000 Europeans and about 11,000 Asiatics and blacks. Since 1867 the city has been governed by a mayor and town council. In 1913 the adjoining municipalities of the Cape Peninsula (Wynberg and Simonstown excluded) were amalgamated with Cape Town, which, embracing Green Point and Sea Point, Woodstock, Maitland, Mowbray, Rondebosch, Claremont, Muizenberg and Kalk Bay, thus extends across the Cape Flats to False Bay, and covers some 60 square miles. In 1921 the population was 183,000, whereof 102,000 were white. The coloured population comprises chiefly Malays, Indians, and those of mixed race. A residential and commercial rather than a manufacturing city, Cape Town's local industries include fruit-growing, viticulture, wine-making, brewing, fishing, whaling, printing and publishing, leather, tobacco, and tea preparation, milling, &c. The environs are exceptionally charming. On one side are the seaside suburbs of Sea Point and Camps Bay, on the other the up-to-date bathing-resort, Muizenberg; between lie a succession of sylvan homes and lovely villages nestling among trees, all connected by electric tram and railway; and behind ever towers Table Mountain with its glorious crags and woods. Rhodes's historic house at Groote Schuur, Rondebosch, is by his prophetic legacy the official residence of the prime-minister of the Union. Portions of the estate are given over to the superb National Botanical Gardens (about 400 acres at Kirstenbosch, established 1913) and as a site for the university of Cape Town.

Cape Verde, the most westerly headland in Africa, jutting out into the Atlantic Ocean, between the rivers Gambia and Senegal, in 14° 41' N lat., 17° 30' W. long. It was discovered by the Portuguese in 1443, and is said to have derived its name from a group of gigantic baobab-trees adorning its summit.

Cape Verde Islands (*Ilhas do Cabo Verde*), a group of Portuguese islands, lying in 14° 45'–17° 30' N. lat., and 22° 30'–25° 10' W. long., and distant 350 miles west of the cape from which they take their name. They comprise ten inhabited islands (Leeward group: Santiago, Fogo, Mayo, Biava; Windward group: St Antonio, Boa Vista, St Nicholas, Sal, St Vincent, St Lucia), besides several rocky islets. Total area, 1486 sq. m.; pop. (1834) 55,833, (1914) 144,000. The islands are all very mountainous, and owe their origin to the action of submarine volcanoes. The highest elevation is reached in a volcanic peak, 9157 feet above the sea, on the island of Fogo, which was active so recently as 1847. The climate is unhealthy during the rainy season (August to October), fever and dysentery being the chief scourges; and long droughts have sometimes given rise to great famines, as in 1730–33 and 1831–33, which latter cost 30,500 lives. Though water is deficient, vegetation is luxuriant, yielding African and southern European products. The chief exports are pignolia-seeds and coffee. Sugar, manioc, yams, maize, tobacco, and indigo are also grown; the woods have of late years begun to increase; and cattle breeding is an important industry. Turtles are abundant in the surrounding seas; amber and ichil are found on the coasts; and much salt, though not so much as formerly, is procured from the lagoons on the shores, especially on the island of Sal. The inhabitants, who are mostly negroes and mulattoes, indolent but harmless, speak a bastard Portuguese. They are all Catholics. The islands are a colony under a governor-general. Porto Grande, on the island of St Vincent, is a coaling station. The capital is Praya (pop. 5000), in Santiago. The islands were discovered in 1441–56 by the Portuguese, who shortly after colonised them. Slavery was gradually abolished between 1834 and 1878. See Darwin's *Volcanic Islands* (1844), Ellis's *West African Islands* (1885), and Vasconcello's *As Colonias Portuguezas* (1903).

Cape Wrath, a pyramidal promontory of granite gneiss of unrivalled wildness and grandeur, forming the north-west extremity of Scotland and of Sutherland, 69 miles NW. of Lairg. It is 523 feet high, and on it is a lighthouse, built in 1828, and seen 27 miles off.

Capgrave, JOHN, chronicler and theologian, was born at Lynn in 1393. He studied some time at a university, most probably Cambridge, and was ordained priest about 1418. He early entered the order of Augustine Friars at Lynn, and he ultimately became provincial of his order in England; at Lynn he died in 1464. Capgrave was an industrious writer. His works include, in Latin, commentaries on many of the books of the Bible, sermons, various edifying and expository treatises; *Nova legenda Anglie* (printed by Wynkyn de Worde in 1516), *De illustribus Henricis*, giving the lives of six emperors of Germany, six kings of England, and twelve famous men, all of the name of Henry; and *Vita Humfredi Ducis Glocestriae*, a life of his patron, Humphrey, Duke of Gloucester. Among his English works are a metrical Life of St Katherine (ed. by Horstmann, 1893); *A Chronicle of England from the Creation to A.D. 1417*; and *Ye Solace of Pilgrimes* (ed. by C. A. Mills, 1911). The *Chronicle* and the *De illustribus Henricis* were edited by Hingeston for the 'Rolls Series' in 1858.

Capias, in common law, a writ directed against the person, so called from the Latin commencement of the process, has various applications, the principal of which are the following:

CAPIAS AD RESPONDENDUM is a writ still used sometimes, instead of a justice's warrant, for the arrest of one against whom an indictment for mis-

demeanour has been found. Formerly, when bail was given in civil actions, it was the writ by which most common-law actions were commenced. Now, under the Debtors Act, 1869, the writ can be used and bail obtained only where the defendant is about to leave the country and his evidence is essential.

CAPIAS AD SATISFACIENDUM, or **CA. SA.** This is one of the writs by which a plaintiff can put a judgment recovered by him in execution. The object of it is to imprison the debtor till satisfaction, but it is rarely used since the abolition of imprisonment for debt. One of the returns to this writ is the famous *non est inventus*. See on the subject of Capias generally, **ARREST**, **ATTACHMENT**, **EXECUTION**, and **BAIL**.

Capillaire, a medicinal syrup, used as a pectoral in chronic catarrhs, formerly prepared by adding sugar and orange-flower water to an infusion of the maidenhair fern, now more generally applied to any flavoured syrup.

Capillaries. The tubes which convey the blood from the heart to the various parts of the body are termed arteries, while those which return it to the heart, after it has discharged its various functions in the body, are known as veins. The name of capillary (from *capillus*, 'a hair') is given to the minute vessels which form the connection between the terminal branches of the arteries and the commencements of the trunks of the veins. These little vessels are of various sizes, some admitting only one blood-corpuscle at once, while others are large enough to allow of the simultaneous passage of two, three, or more corpuscles. In the muscular tissue their average diameter is 0.003 of a line; they are smallest in the brain, and largest in bone. Their arrangement varies in different parts. In the accompanying figure, which represents their distribution in muscular tissue, they run for the most part parallel to one another; in other cases (as around fat-cells) they have a spherical arrangement, and in the skin and in parts of the intestines they form loops; and many other forms of distribution might be mentioned. These various arrangements have been discovered by the microscopic examination of tissues that have been successfully injected with coloured fluids.

The circulation of the blood through the capillaries may be readily seen in the web between the toes of the hind-foot of the frog, in the tongue of that animal, in the tail or gills of the tadpole, in the wing of the bat, &c. The wall of a capillary is formed of a single layer of flattened cells, attached to each other by their margins (which may be rendered apparent by nitrate of silver), and continuous with the corresponding layer lining Arteries and Veins (q.v.).

The principal uses of the capillary system of vessels will be noticed in the articles **DIGESTION**, **RESPIRATION**, and **SECRETION**.

Capillarity. When a number of clean glass tubes of very fine bore, each open at both ends, are immersed in water, or in any other liquid capable of wetting them, the water rises in each to a higher level than that at which it stands outside,

Capillaries:
a, the artery; b, the vein;
c, the intervening capillaries.

and the finer the bore the greater is the height of the water. Moreover, the surface of the water is always concave outwards. The accompanying diagram (a) shows the phenomenon in question.

When similar tubes are immersed in mercury the results are just the opposite of the above. The

mercury now stands at a lower level inside than outside each tube, and the mercury-surface is always concave downwards. The diagram, if turned upside down, will correspond to this effect. In both cases it is to be observed that the curvature of the surface of the fluid is greater the finer the bore of the tube.

These are the fundamental facts which constitute the phenomena of capillary action, the tubes, with their fine hair-like bores, being called *capillary tubes*, from *capillus*, 'a hair.' The phenomena of capillarity may, however, be produced without the use of capillary tubes. Thus, if two plates of clean glass be set vertically and parallel to one another in a dish of water, the liquid will rise up between them, but the rise is only half of that which would occur in a capillary tube whose diameter is equal to the distance between the plates. As in the case of capillary tubes, the height of the water increases as the distance between the plates diminishes, and the water-surface is concave outwards. If mercury be used in place of water, the mercury will be depressed, and its surface will be convex.

If the plates have two vertical edges in contact, while the opposite edges are kept separate by a thin wedge, the water will rise between the plates to different heights, the height at any point being inversely as the distance between the plates at that point. The intersection of the water-surface with the plate thus forms a curve which is known as the equilateral hyperbola. The diagram (b) shows the phenomenon in question.

In order to understand the cause of capillary action it is necessary to refer to what is known as the surface-tension of fluids. The particles of a body of moderate dimensions are kept together by powerful molecular forces which have one main characteristic, that they are only sensible at insensible distances. From this it is at once evident that there must be an essential difference in state between parts of a liquid close to its surface and others in the interior of its mass. The result of this difference is that every liquid may be regarded as bounded by a surface-film which behaves like a stretched membrane. The tension of this film is what is termed the surface-tension of the fluid. Now, when a soap-bubble is blown at the mouth of a funnel, and the neck is left open, the bubble shrinks and expels the contained air. The air within the bubble is thus proved to be at a pressure greater than that of the atmosphere, otherwise it would not rush out; and it can be proved by mathematical methods that the effect of the surface-tension of the soap film is to make the pressure per unit of surface on the concave side exceed that on the convex side by the expression $2T \left(\frac{1}{R_1} + \frac{1}{R_2} \right)$, where T is the intensity of the surface-tension, and R_1 , R_2 , are the radii of curvature of any two sections normal to the surface and to each other.

We are now in a position to explain the fundamental capillary phenomena. The water-surface is concave outwards, and therefore the water im-

mediately under the surface-film has a less pressure than that of the atmosphere to which its concave side is exposed; and thus by the ordinary hydrostatic law it belongs to a higher level than the undisturbed water, the pressure on which is equal to that of the atmosphere. In the case of mercury, on the other hand, we see that, since the fluid surface is convex outwards, the mercury immediately under the surface-film must have a greater pressure than that of the atmosphere, and must therefore stand at a lower level than the undisturbed mercury.

It can be shown mathematically that the height of elevation of water, or depression of mercury, varies inversely as the radius of the tube. This agrees with the experimental fact that the finer the bore the greater is the capillary action, and is also a direct consequence of what has been stated above. The finer the bore, the greater is the curvature of the surface, and therefore the greater is the difference between the pressure on the concave and that on the convex side of the film. Thus we account for the increased height of elevation of water and depression of mercury.

We have now to explain why the water-surface is concave and the mercury-surface convex.

When two fluids, such as water and air, are in contact, we have seen that the surface of separation is in a state of tension. Now, when a solid is in contact with two fluids, as in the case of water in a capillary tube, there is a different tension in each of the three surfaces separating a pair of media. Further, since the solid cannot alter its form, the angle at which the surface of contact of the two fluids meets the surface of the solid, called the *angle of capillarity*, must depend on the value of the three surface-tensions. When the two fluids are air and water, or air and mercury, the tension of the surface separating the two fluids exceeds the difference between the tensions of the surfaces separating the solid from each of the fluids; and thus the angle of capillarity will be acute or obtuse, according as the one or the other of the latter tensions exceeds the other.

The effect of heat on capillary action may be noted in passing. When heat is applied, it is found that the tension and curvature of a water-surface are diminished, and thus, on both accounts, the height to which water rises, or the depth to which mercury is depressed, in a capillary tube, becomes less as the temperature rises.

The depression of mercury in a fine glass tube makes it necessary to use a correction in reading off the height of the mercurial column in the barometer, which, owing to it, stands always a little lower than the height due to the atmospheric pressure.

There are many phenomena which can easily be explained by the help of capillary action. Thus, when two light bodies, such as two pieces of cork, are left to float on still water, near each other, they soon come together, moving at last with a rush. The water wets the floating bodies and rises round them, and thus, when they are near each other, the space between them becomes like part of the interior of a capillary tube; and, the pressure between the bodies being less than that outside, the bodies are driven together, and therefore seem to attract one another. This is always the case with any two bodies each of which is wetted by the water, and it is also true when neither is wetted. If one of the bodies is smeared with oil to prevent the water from wetting it, the two will behave as if they repelled one another. Again, when a drop of water is placed between two very true plates of glass, the pressure produced by the capillary action forces the plates together, thus increasing itself not only by the enlargement of the wetted surfaces, but by increasing the curvature round the edges. The pressure produced in this way may be sufficiently

great to crack the plates. The action of a boy's 'sucker' is explainable in a similar manner.

Capistrano, GIOVANNI DA, born 24th June 1386, at the little town of Capistrano, in the Abruzzi, entered the Franciscan order at the age of thirty, and there distinguished himself by his eloquence and devotion. From 1426 he was employed as legate by several popes, and acted as inquisitor against the Fraticelli (q.v.). In 1450 he preached a crusade in Germany against Turks and heretics, appealing to the masses, not the nobles, and successfully opposed the Hussites in Moravia, although from Bohemia he was expelled by George Podiebrad; his fanaticism led to many cruel actions, such as the racking and burning of forty Jews in Breslau, on a charge of profaning the Host. When Belgrade was besieged by Mohammed II. in 1456, he led a rabble of 60,000 to its relief; but his enthusiasm was greater than his strength, and he died at Illock, on the Danube, 23d October 1456. He was canonised in 1690.

Capital, DISTRIBUTION PER, is a familiar expression in the law relating to wills and succession. It means that where the persons claiming under a will consist of, e.g. three families of grandchildren, the estate or fund is divided equally among all the grandchildren (whatever the size of the family), and not equally among the three families. The opposite principle of division, viz. among families, is called distribution *per stirpes*. It is surprising how frequently testators fail to make their meaning clear on this simple point.

Capital. See COLUMN.

Capital, in the ordinary sense, is the means with which business is carried on, and may consist either of money or of property convertible into money. In the more accurate language of political economy, capital is wealth appropriated to reproductive employment. It is wealth used for producing more wealth. That which distinguishes capital from other forms of wealth is the purpose to which it is applied. A painting, so long as it adorns the room of a private gentleman, cannot be regarded as capital; in the hands of a dealer, who sells it in order to make a profit, it becomes a form of capital. Capital is one of the three requisites of production, the other two being land and labour. Capital is usually divided into two classes—*circulating* capital, which consists of the wages paid to the workmen, and of the raw material used up in the processes of industry, &c.; and *fixed* capital, consisting of buildings, machines, tools, railways, telegraphs, canals, shipping, &c. Circulating capital is being continually used up, and disappears in the using, while fixed capital may last for a long time, and may be used over and over again. Railway lines, canals, and docks, may last for generations, and with the necessary repairs, renewals, and improvements, continue as effective as ever. It should be remembered, however, that such distinctions are only generally valid, and that a very definite line between fixed and circulating capital cannot be drawn. Thus with regard to railways, while the stations and permanent way are undoubtedly fixed capital, we may justly hesitate as to the engines and wagons, which only last a few years.

With reference to fixed capital, it should also in general be said that its permanence is only one of degree. Machinery, tools, and shipping, have only a limited duration, as they either become worn out, or, as more frequently happens, are superseded by more effective appliances. Docks, canals, bridges, and great works for the reclaiming of agricultural land, are more adapted for permanence. But though considerable, they are only a limited part of the capital of a country. The vast

proportion of capital needs from time to time to be replaced.

Capital is the result of the industry of past generations used to promote and facilitate the industry of the present and future. In every form of capital we can trace the labour, ingenuity, and foresight of the men who have lived before us. The history of capital is a process of development, of invention, adaptation, and accumulation, which is observable in different degrees at different epochs of the world, but during the last hundred and fifty years has been vastly more active than at any former period. It is usual to say that capital is the result of saving or abstinence, but such a formula gives a very misleading conception of the motives which have led to the growth of capital. The growth of capital is a mixed process, the real motives of which can be truly and adequately understood only by a study of the historical facts. No doubt there has been abstinence, but there have been many other moral qualities displayed in the process. For the development of capital it is of course necessary that production should exceed consumption, leaving a sufficient margin for future increase. In the modern development of capital the energy and inventiveness with which natural resources have been utilised for the production of wealth have been unexampled, resulting in the formation of new forms of capital, and in a gigantic accumulation of it absolutely unparalleled. The productive power of capital is indeed practically unlimited. This enormous development of capital has offered new problems to the economist, or at least presented the old questions in a new light.

The history of capital is a process of evolution which can be rightly understood only in its connection with the general history of society. It must specially be studied in connection with the other requisites of production, land and labour.

CAPITALISM, in social and economic discussion, means the rule of the capitalists or owners of capital. These are the controlling power in the present industrial system, and have taken the place formerly held by the landed aristocracy as the pivot of the social and political order. See **SOCIALISM**.

Capital Account. Such is the name given to what concerns the capital stock of a railway or other public company. In authorising a railway company, parliament or congress gives power to raise so much money by shares, and so much by borrowing. This money forms the capital of the company; and constitutes the *Capital Account*. On this fund the directors of the company make drafts to pay for the land, and all the works connected with the line, as also rails, locomotives, carriages, and, in short, everything involved in perfecting the railway up to the point of working. After the railway is opened, all working expenses and renewals of line and plant should be charged to Revenue Account, but extensions of the line and additional plant should be charged to Capital Account. The same principle applies to all joint-stock companies. It is of the utmost importance that these two accounts be kept quite distinct, and that nothing be charged to capital which ought to be defrayed by revenue. It is by neglecting this precaution that an appearance of fallacious prosperity has often been produced, which has ultimately ended in ruin.

Capital Punishment in criminal jurisprudence is the punishment of death (Lat. *capitis poena*). This extreme penalty, notwithstanding the practice of the world from the remotest times down to the present day, has frequently been reprobated by philosophers and philanthropists, who have even gone so far as to deny the right so to punish by any earthly power. Thus many

hold strongly that, while higher animals may destroy the lower, man being the highest created existence on earth can be lawfully deprived of life by God alone. They argue that the voluntary destruction of human life by man is in all circumstances a violation of moral law—an argument which seems to involve the absolute prohibition not only of capital punishment, but of war. The weight of opinion, however, among the most generally accepted authorities appears to be in favour of capital punishment, on the ground that the execution of malefactors is, in certain circumstances, necessary for the protection of society against the repetition of certain forms of crime. The Marquis Beccaria and others, however, strongly argued against the capital sentence being carried out in any case, denying the right, in fact, of government so to punish, and maintaining, besides, that it is a less efficacious method of deterring others than the continued example of a living culprit condemned, by labouring as a slave, to repair the injury he has done to society. Bentham, on the contrary, holds that death is regarded by most men as the greatest of all evils; and that especially among those who are attached to life by the ties of reputation, affection, enjoyment, hope, or fear, it appears to be a more efficacious deterrent than any other. On the question of right, Beccaria is still more pointedly refuted by Sir Samuel Romilly, who did so much to mitigate the severity of the criminal law: 'Beccaria and his disciples confess that it is not the greatest of evils, and recommend other punishments as being more severe and effectual, forgetting, undoubtedly, that if human tribunals have a right to inflict a severer punishment than death, they must have a right to inflict death itself.'

In all discussions on this subject it is necessary to bear constantly in mind the principles of punishment in general. These have been a fruitful subject of controversy for many centuries, but the general rule can hardly be better stated than in the words of Plato (*Gorgias*, § 525) 'Every one who undergoes punishment, if that punishment be rightly inflicted, ought either to be made better thereby, and profit by it, or serve as an example to the rest of mankind, that others, seeing the sufferings he endures, may be brought by fear to amendment of life.' And again (*Protagoras*, § 324) he says: 'No one, when punishing a criminal, directs his thought to the fact, or punishes him for the fact of his having committed a crime; but he who wishes to inflict rational punishment acts with regard to the future, that the man who is punished, and all who see him punished, may be deterred from doing wrong again.' On this principle, capital punishment for murder is justified only in so far as it tends to prevent murder; and if there be a mode in which the murderer's life can be spared without sacrificing other lives, then capital punishment is inadmissible. Thus we are driven back on the teaching of experience. The question can be answered only relatively, and statistics seem to show that the same answer will not be always and everywhere the true one. In some states of society—especially in half-settled or semi-civilised communities—criminal statistics afford strong confirmation of the theory which maintains the superior efficacy of capital punishment as a deterrent. On the other hand, the experience of many states in Europe, where the death penalty has been abolished, is difficult to reconcile with the view that the maintenance of the extreme penalty affords the best security for human life.

While the primary ends of punishment are to prevent the repetition of the crime by the wrong-doer, and to deter others by making the wrong-doer a warning, it is necessary to keep in mind that the administration of criminal justice owes

a great part of its strength and effectiveness to the instinct of retribution and the demand for vengeance. The conception of punishment or retribution, or, in other words, the principle that as a man deals with others so should he himself be dealt with, is fundamental in the early history of criminal law (see CRIMINAL LAW). 'Thine eye shall not pity; but life shall go for life, eye for eye, tooth for tooth, hand for hand, foot for foot' (Deut. xix. 21). This conception of penal justice still holds a firm place in popular thought, and it has been maintained by distinguished lawyers and philosophers. Thus it finds terse expression in the statement of Lord Justice Fry: 'The object of punishment is to adjust the suffering to the sin.' Similarly Kant holds that punishment cannot rightly be inflicted for the sake of any benefit to be derived from it either by the criminal himself or by society, and finds the sole and sufficient justification of it in the principle that an evil-doer should make satisfaction for the wrong he has done by suffering according to his deserts.

In recent years there has grown up a sentiment of compassion for the criminal. The sense of the reality of guilt is less strong. There is a tendency to consider the criminal as a victim of circumstances, and to have regard to the moral and mental condition of the wrong-doer rather than to the quality of his act. Such sentiments, if they become excessive, are a source of danger in the administration of criminal justice. If a penalty appointed by criminal law is out of harmony with public opinion, or is generally regarded as unduly severe, the consequence is that juries, influenced by considerations springing from the nature of the penalty, refuse to convict. In this way the penalty comes to lack certainty—a feature without which no punishment can be effectual as a deterrent. That some influence similar to this is at work in recent years in Great Britain may fairly be inferred from the official statistics, which show that the proportion of convictions in charges of murder is much less than in charges of non-capital crimes.

Death was in former times in England the ordinary punishment for all felonies. It would be possible to extend almost indefinitely the list of offences for which men could be legally hanged at the commencement of the 19th century. It must, however, be remembered that the practice of the law had for many years been much less severe than the theory. Thus, while there were more than 200 offences in the statute-book for which capital punishment might be inflicted, there were only twenty-five offences for which any one had suffered death during the preceding three-quarters of a century. To the exertions of Sir Samuel Romilly we are mainly indebted for the reformation of our criminal code, and the removal from the statute-book of the obsolete relics of a barbarous age. From 1808 to his death in 1818 Romilly, undaunted by many discouraging failures, strenuously continued his humane efforts to destroy this cruel system. Later the cause of criminal reform found in Sir James Mackintosh a bolder and abler, if not more earnest, champion, and under his praiseworthy exertions, aided by the wise counsels of Peel, the inhumanity and impolicy of the old criminal code gave way to a course of legislation which has reduced the application of death as a punishment within its present humane limits. In 1823 five statutes exempting from capital punishment about a hundred felonies were passed by both houses without a dissentient voice, and Peel's subsequent efforts in 1826 to consolidate the criminal law were no less successful. The punishment of forgery with death ceased in 1832-37. Since the statute of 1861 there remain in England only four crimes punishable by death—setting fire to H.M. dock-

yards or arsenals, piracy with violence, treason, and murder. Practically it is only in the case of treason and murder that the capital sentence is ever pronounced; and even then it is not always carried out, for the crown may in its absolute discretion exercise the prerogative of mercy. In practice the Home Secretary, if for any reason he thinks the case a fit one for the interposition of the royal mercy, recommends this course to the king—the penalty of penal servitude being usually substituted.

In Scotland the administration of the criminal law has perhaps been, on the whole, as severe as in England. Erskine says that 'those crimes that are in their consequences most hurtful to society are punished capitally or by death,' a category that is certainly sufficiently indefinite. But in the more modern practice of Scotland capital sentence was only pronounced in the four pleas of the crown—viz. murder, rape, robbery, and wilful fire-raising, to which may be added housebreaking. By the Criminal Procedure (Scotland) Act of 1837, 50 and 51 Vict. chap. 35, it is enacted that capital sentences shall be abolished except on conviction of murder or of offences against the Act 10 Geo. IV. chap. 35, by which a variety of attempts to murder are made capital. The Children Act, 1908 (8 Edw. VII. chap. 67), enacts that sentence of death shall not be pronounced against a person under sixteen years of age. This enactment extends to England as well as to Scotland.

In the United States, each state has jurisdiction over its own territory, and the laws punishing crime differ in several respects. In many of the states murder is by statute divided into different degrees, differing from each other by the malice and premeditation which accompany the act. Death by hanging is the usual penalty for murder of the first degree, but in a few states imprisonment for life is substituted for capital punishment. In some states, as Michigan, Wisconsin, Rhode Island, and Maine, capital punishment has been done away with. In the states of New York and Iowa, on the other hand, the legislatures, having abolished the death penalty, were compelled by the consequent increase of crime to restore it.

In Holland there have been no executions since 1860, and capital punishment was totally abolished by law in 1870. In Rumania it was abolished in 1864, and Portugal has adopted the same course. In Belgium the punishment of death is practically abolished, for, though the death sentence is formally retained, no execution has taken place in that country since 1863. In Switzerland capital punishment was totally abolished in 1874, but, owing to a marked increase in the number of murders, by a federal decree of 18th June 1879 the cantons recovered the right of re-establishing the punishment of death in their respective territories. In many European countries in which the extreme penalty is still enforced, the law has been practically abrogated by the marked growth of more humanitarian sentiments.

For the various methods of execution, whether hanging as in England and most parts of the United States, beheading by sword or guillotine as in Germany and France, garroting as in Spain, and death by electrocution as in New York, see EXECUTION, and the articles on the several methods. In England, in 1868 (as in Germany since 1877), an act was passed directing that all executions should henceforth take place within the walls of prisons.

In Military Law, owing to the necessity of enforcing strict discipline, capital punishment has always held an important place. The offences to which the death penalty is attached are in Britain regulated by statute. The law on the subject as regards the army is contained in the Army Act,

the Reserve Forces Acts, the Territorial and Reserve Forces Act, 1909, and the Rules of Procedure. The Army Act, which now forms the foundation of the military law of the United Kingdom, is continued annually by act of parliament. Capital punishment may be incurred by various acts of sedition, violence, and gross neglect of duty. Any soldier who deserts His Majesty's service, or leaves without orders any guard or post, or offers violence to his superior officer, being in the execution of his office, or disobeys any lawful command of his superior officer, renders himself liable to the penalty of death, or such other penalty as the court-martial may inflict. Certain other specific offences are punishable by death only when they are committed on active service. In the ordinary case sentence of death can be passed only by a general court-martial, consisting of nine officers, of whom five are not under the rank of captain. On active service, however, a field-general court-martial, consisting of three officers, may award the death penalty. Another safeguard against undue haste and lack of consideration is found in the provision that no sentence of death can be pronounced by a court-martial unless two-thirds of the officers present, in the case of a general court-martial, and all in that of a field-general court-martial, concur therein. No sentence is valid unless it is duly confirmed by an authority independent of the court which pronounced the sentence. It is also provided that a judgment of death may be commuted for penal servitude for any term not less than four years, or for imprisonment for such term as shall seem meet. The system of military laws drawn up for the army is also applicable to a limited extent to the territorial force, especially when called out for service. In the army capital punishment is inflicted by the offender being either shot or hanged. In the United States the concurrence of two-thirds of a general court-martial is also required; and no sentence of death can be carried out until confirmed by the president, save in cases of persons convicted in time of war, as spies, mutineers, deserters, or murderers.

In the British navy, the law on the subject is covered by the Naval Discipline Act, 29 and 30 Vict. chap. 109, amended by a series of later acts which now constitute together the penal code of the navy. Formerly certain offences in the navy, whether on board ship or on shore, were punished with death absolutely, without any discretion in the court to alter or mitigate the sentence. It was under these unnaturally severe Articles of War, passed in the twenty-second year of Geo. II., under the influence of the Duke of Cumberland, that the unfortunate Admiral Byng (q.v.), having been found guilty of neglect of duty in an action against the French, was shot in 1757. On that occasion the court-martial, before passing sentence, sent to the Admiralty in London to know whether they were at liberty to mitigate the sentence, but were informed that they had no such power. The provisions of the present act, however, confine sentence of death, without alternative, to cases of murder or traitorous misconduct in the presence of the enemy. As regards all other offences, the courts-martial are authorised to abstain from pronouncing sentence of death, if they shall think fit, and to impose such other punishment instead, as the nature and degree of the offence may deserve. Further, except in the case of mutiny, the punishment of death, awarded by a court-martial, cannot be inflicted until the sentence has been confirmed by the Admiralty or by the commander-in-chief on a foreign station. In this discretionary sense the death penalty is retained in the navy in the case of a large number of offences, such as acting as a spy for the enemy, mutiny, cowardice, desertion to

the enemy. Judgment of death can only be passed with the concurrence of a two-thirds majority of the court-martial, or if the officers present do not exceed five, with the concurrence of four of them. In the United States all sentences of death must be approved by the president.

Capitals (*majuscula*), in contradistinction to small letters (*minuscula*), are larger and differently shaped letters employed in writing and printing to help the eye, to relieve the uniformity of the page, to increase the facility of keeping and finding the place, to mark the beginnings of sentences, proper names, &c. Among the ancients, and during the earlier part of the middle ages, no distinction between capitals and small letters was known; in a sense, writing was originally all capitals (UNICATS, q.v.); and after the practice had been introduced of beginning books and chapters with great letters, often adorned or illuminated with much artistic ability, it was long before capitals were employed in such a way as could afford much real advantage to the reader. Considerable diversity has existed at different times with regard to the employment of them, the books of the 17th and 18th centuries exhibiting a much greater proportion of them than those of the present day. In German books all substantives usually begin with a capital letter. Adjectives formed from proper names, as *English*, *French*, and the like, are generally begun with a capital in English books, but not in French nor in German ones. SMALL CAPITALS are so called as being smaller than the initial capitals. See ALPHABET, WRITING.

Capitation. For Capitation Grants, grants of so much per head, see EDUCATION; for Capitation Tax, see POLL-TAX.

Capito, GAIUS ATEIUS (c. 37 B.C.–22 A.D.), a Roman jurist, founder of the school opposed to Labeo, seems to have gained the favour of Augustus and of Tiberius by his subservience.

Capito, or KOPFEL, WOLFGANG FABRICIUS, reformer, born in 1478 at Haguenuau in Alsace, entered the Benedictine order, and became professor of Theology at Basel, where he showed in his lectures a tendency to shake off the trammels of the scholastic writers. He approved of Luther's action, but nevertheless in 1519 entered the service of Albert of Mainz; and it was not till some years later that he finally declared for the Reformation. He then entered zealously into its work, shared with Bucer the composition of the *Confessio Tetrapolitana*, and took part in the Synod of Bern in 1532. He died in November 1541.

Capitol (Lat. *Capitolium*), the great national temple of ancient Rome, situated on the southern summit of the *Mons Capitolinus*, the smallest but most famous of the seven hills on which Rome was built. The hill is an irregular oblong in figure, about three-quarters of a mile in circumference at its base, running from north-east to south-west, and terminating at its southern extremity within 250 yards of the river in a precipice with an abrupt fall of 80 feet—the 'Tarpeian Rock,' over which state-crime was thrown. On its northern summit, the higher and steeper of the two, stood

the *Arx* or citadel of Rome, the site of which is now occupied by the church of *S. Maria in Araceli*. Since the whole hill was fortified and regarded as the natural defence of the city, *Arx* is not unfrequently used as if synonymous with *Mons Capitolinus*, and similarly from the importance and reverence attaching to the temple the name *Capitolium* often means the whole hill. The Capitol was founded by Tarquinius Priscus, and completed by Tarquinius Superbus. It was burned down during the civil wars (83 B.C.), was rebuilt by Sulla, was burned again by the soldiers of Vitellius (69 A.D.), rebuilt by Vespasian, but burned a third time in the reign of Titus (80), and splendidly restored by Domitian, whose structure lasted to a late period of the empire. The original ground-plan, however, with that rigid conservatism so characteristic of Roman law and religion, was never altered. The temple comprised three distinct cells (*cellæ*), in closed by one roof, the middle cell dedicated to Jupiter, those on either side to Juno and Minerva. In the Capitol the Sibylline books were stored, and here the consuls on entering upon office offered up sacrifices and made their vows; hither also the victorious general on his triumph was borne in his triumphal car to give thanks to Jupiter.

The modern Capitol (*Campidoglio*), built on the site, and part of the basement of the ancient Capitol, was designed by Michelangelo, but is one of his inferior works.

On the Capitoline Mount there was also the temple of Jupiter Tonans, built by the Emperor Augustus; and the magnificent *Tabularium* (built by Quintus Catulus, 73 B.C.), containing archives. For the U.S. Capitol, the building in which Congress meets, see WASHINGTON; the state capitols are mentioned in the articles on the state capitals, ALBANY, AUSTIN, &c.

Capitularies (Lat. *capitularia*), the name given to the laws, or royal enactments, issued by the Frankish kings. These laws proceeded from the great assemblies of the king, nobles, and bishops, which formed the estates of the kingdom, as distinguished from the laws issued for the separate states, which were called *leges*. They were divided into general and special *capitularies*, according to the more or less general nature of the interests which they embraced, and the mode of their publication. They have by no means been all preserved. The most famous are those of Charlemagne and of St Louis. The first collection was made in 827. It contained in four books the capitularies of Charlemagne and his son Louis le Debonnaire. They were brought down to 845 by Benedict, deacon of Mainz, and later supplements were added by successive editors, until the number of capitularies reached 2100. These were all included in the great edition of Baluze (2 vols. Paris, 1677).

Capitulation, a treaty consisting of several specified conditions (Lat. *capitula*, 'heads'). In the military sense of the word, a capitulation is a treaty of surrender to an enemy. When a place can no longer be defended, on account of failure of ammunition or provisions, or the progress made by the besieging party, a white flag is commonly hoisted as a sign that the besieged are willing to capitulate. According to the kind and degree of peril in which the fortress is placed, so are the terms which the governor may reasonably look for from his successful opponent. Sometimes the arms and military stores are left to the besieged, but oftener they are taken by the besiegers, except articles of private property belonging to the officers and men. The 'honours of war,' the marching out with drums beating and colours flying, are usually stipulated for, unless the conqueror exacts very

severe terms. The mildest form of a capitulation is a *convention*, agreed to when the conqueror is not strong enough to insist on stringent conditions.

Capitulation is also the name given to an arrangement by which foreigners receive certain immunities in the state within which they reside, such as the grants made in the 17th century by the Porte to France, and later to other western countries. These capitulations were annulled by the Treaty of Lausanne (1923), and replaced by a convention regarding residence, business, &c. In like manner foreigners in Egypt and Japan used to be subject to their own consular jurisdictions, and exempted from native judicatories. See **CONSUL**.

Capo d'Istria, a fortified seaport of Italy (Austria till 1919), situated on a rocky island in the Gulf of Trieste, $9\frac{1}{2}$ miles SSW of the city of Trieste. Connected with the mainland by a stone causeway, nearly half a mile long, it has a modern cathedral, a Gothic town-hall on the site of a Roman temple, and a trade in pilchards, oil, salt, and wine. Pop. 10,000. In ancient times it was known as *Ægida*, and afterwards as *Justinopolis*, in honour of Justin II., who restored it.

Capo d'Istrias, IOANNES ANTONIOS, COUNT, president of the Greek republic from 1828 to 1831, was born 11th February 1776 in Corfu, where a monument was erected to him in 1887. His family had been settled there since 1873, but originally came from the Illyrian town of Capo d'Istria. He devoted himself to political life, and in 1809, after holding a high position in the Ionian Islands, he entered the diplomatic service of Russia. Here his policy tended to the separation of Greece from Turkey. In 1828 he entered on a seven years' presidency of Greece; but imbued as he was with Russian ideas, he aroused discontent by his autocratic measures; and on 9th October 1831 he was assassinated in a church at Nauplia. See his *Life* by Mendelssohn-Bartholdy (Berl. 1864). His feeble brother, Iony Augustinos (1778-1857) succeeded him, but resigned in the following April.

Caponier. See **CASEMATE**.

Caporetto, a village on the Isonzo, scene of an Italian defeat in 1917. See **WAR (GREAT)**.

Cappadocia, the name of a district of Asia Minor, the signification of which differed widely at different periods in its history. Under the Persian rule it included the whole north-eastern part of Asia Minor from Mount Taurus to the Euxine; but after its division into two satrapies, the central and inland came to be called Cappadocia proper; the other Cappadocia ad Pontum, gradually shortened to Pontus. In the former and stricter sense Cappadocia was bounded by Galatia and Lycaonia on the west, by Cilicia and Syria on the south, by Armenia on the east, and by Pontus on the north. It is a high upland region broken by detached mountains and groups of mountains; its eastern portion is traversed by the Anti-Taurus. The river Halys (Kizil Irmak) crosses the northern part of Cappadocia. Ruled under the Persians by hereditary satraps or tributary kings, Cappadocia was the ally successively of the kings of Macedonia, of Mithridates, and of the Romans, but ultimately (17 A.D.) became a Roman province.

Capparidææ, or **CAPPARIDACEÆ**, a dicotyledonous order allied to **Cruciferae**, including about 350 known species, herbaceous plants, shrubs, and trees, mostly natives of tropical and subtropical countries. Many of the species possess stimulant properties. Of this the species of *Capparis* furnish the most familiar example (see **CAPERS**); but *Cleome pentaphylla* (the mustard-caper) blisters the hand, and some are positively poisonous.

Cappello, **BIANCA**. See **MEDICI**.

Caprera, one of a group of small islands called the *Buccinari Islands*, in the Strait of Bonifacio, to the east of the northern extremity of Sardinia, from which it is separated by a strait less than 2 miles broad. Measuring 6 by 2 miles, and $10\frac{1}{2}$ sq. m. in area, it is rocky, bare, and unfertile, with no streams, and few places adapted either for the pasture of cattle or for the plough. In former times it was the abode only of wild goats—whence its name (Lat. and Ital. *capra*, 'a goat')—and rabbits, and was occasionally visited by goat-herds and fishermen. It was the much-loved home of Garibaldi from 1854 till his death here on 2d June 1882. He was buried behind his house. In 1885 the island was purchased from his heirs by the Italian government.

Capri (the ancient *Capreae*), a charming island in the Mediterranean, at the entrance of the Bay of Naples, $3\frac{1}{2}$ miles from Cape Campanella, and 21 S. of Naples. Only $3\frac{1}{2}$ sq. m. in area, it yet displays a rich variety of beautiful scenery, ruins of antiquity, and points of historical interest, and contains a population of 7000. The island is composed of two mountain masses, separated from each other by a depression like the seat of a saddle. That on the west, called Monte Solaro, has an elevation of 1918, that on the east of 860 feet. On a shelving rock at the base of the eastern mountain stands the town of Capri, with walls, gates, and drawbridges, and a population of 5000. It commands a beautiful prospect, and till 1870 communicated with Anacapri, on the western tableland, by a rock-hewn flight of 536 steps; now, however, there is a carriage-road between the two places. The coast is precipitous, with only two safe landing-places, both near Capri. The island was a celebrated place in the times of Augustus and Tiberius. Ruins are still found of Roman baths and aqueducts, and of the twelve grand villas or palaces built in honour of the twelve chief deities by the Emperor Tiberius (q.v.). The inhabitants now consist of fishermen, sailors, and a few traders, with vine-dressers and cultivators of olives in Anacapri. Wherever a tree can be planted, the hopeful and industrious people have prepared for it a soil by persevering toil in terrace-culture. The wine of Capri, both red and white, is well known in commerce. Delicious quails, which in vast numbers alight on the island during their migrations to and from Africa, in spring and autumn, are taken in nets, and form an important item in the resources of Capri. To the west of the town of Capri is situated the *Grotta Azzurra* (Blue Grotto), a remarkable cavern, entered from the sea by a narrow opening not more than three feet high. Inside, however, it is found to be of magnificent proportions and of marvellous beauty, the gorgeous colouring being said to be produced by the reflection and refraction of the sun's rays through the water. Elliptical in form, it has a length of 118 feet, a breadth of 98 in the widest part, and a height of 40 in the loftiest, with 39 feet of water beneath. See German works by Gregorovius (Eng. trans. 1879) and Allers (1894); and by Alan Walters (1893).

Capriccio, in Music, is a species of free composition, not subject to rule as to form or figure. The earliest application of the term was to pieces in a fugued style, upon a lively subject. Last century capriccios were of the nature of studies, in which one single figure predominates. It is used in the modern form 'caprice,' as equivalent to 'fantasia,' though sometimes deviating little from regular sonata or rondo form, as in Mendelssohn's several examples.

Capricornus, the *Goat*, the tenth sign of the Zodiac (q.v.). For the tropic of Capricorn, see **TROPICS**.

Capridæ, a term sometimes used to denote the Sheep and Goat family (Ovis and Capra), as distinguished on the one hand from Cattle (Bovina), and on the other from Antelopes (Antelopina). The term Ovina is more frequent.

Caprification, an ancient custom of hanging goat-fig or Caprificus branches on trees which produce edible figs. The wild fig is monœcious, the cultivated practically diœcious, since it is propagated by cuttings which retain the character of the branches from which they were taken. On the goat-fig, derived from branches which bear spring inflorescences, we find, as on those branches of the wild fig, (1) male flowers, and (2) sterile female flowers, which the eggs of an insect (*Blastophaga*) turn into galls. On the edible fig-tree we find normal female flowers which are not adapted to become galls. Their styles and stigmas are quite different from those of the female flowers on the goat-fig. Now, when the parasitic insects become mature and leave the galls of the female flowers on the goat-fig, they bear with them also the pollen from the male flowers of the same tree. They fly to the edible fig-tree, and there fertilise the normal female fig-flowers. The ancient custom is therefore very reasonable. The male and insect-containing female flowers of the wild-fig are hung on the edible fig-tree, that so the pollen of the male flowers may be carried by the liberated parasitic insects to fertilise the normal female flowers, and produce seed-bearing figs. Seedless figs, eaten fresh, require no pollination. See a work by Solms-Laubach (Gottingen, 1882); Ravasini, *Die Feigenbaume Italiens* (1911); Bicknell, *The Common fig-tree* (Bordighera, 1912); also FIG.

Caprifoliaceæ, a natural order of sympetalous dicotyledons, nearly allied to Rubiaceæ, from which they are mainly, though not infallibly, distinguished by the absence of stipules, and containing about 200 species of shrubs and herbs, natives of the north temperate zone. Many are cultivated in our gardens and shrubberies—e.g. the Honeysuckles (*Lonicera*), the Snowberry (*Symphoricarpos racemosus*), the Guelder Rose or Snowball (*Viburnum Opulus*), the Wayfaring Tree (*V. lantana*), the Laurustinus (*V. tinus*), the Elder (*Sambucus niger*), and the beautiful *Diervilla* (*Weigelia*) rosea, introduced from China or Japan. The charming little *Linnaea borealis* is one of the rarest of British plants, but common in parts of North America.

Caprimulgidæ. See GOATSUCKER.

Caprivi, GEORG LEO, GRAF VON, German imperial chancellor, was descended from a family originally Friulian, which settled in Silesia in the 17th century, and is sometimes called Caprivi de Caprara de Montecunli. Count Georg Leo, born in Berlin, 24th February 1831, entered the army in 1849, fought in the campaigns of 1864 and 1866, and in the Franco-German war of 1870 was chief of the staff to the 10th Army Corps. In 1883-88 he was at the head of the Admiralty; in 1888 he became commander of his old army corps. On the fall of Bismarck, in 1890, he became imperial chancellor and Prussian prime-minister. His chief measures were army bills and a commercial treaty with Russia; in 1894 he resigned. He died 6th February 1899. See his *Reden*, with Life by Arndt (1893).

Caproic, Caprylic, and Capric Acids are represented by the formulæ $\text{HC}_6\text{H}_{11}\text{O}_2$, $\text{HC}_8\text{H}_{15}\text{O}_2$, and $\text{HC}_{10}\text{H}_{19}\text{O}_2$, and are members of the acetic or fatty-acid series. They derive their names from *capra*, 'a goat,' in consequence of their more or less resembling in smell the odour of that animal. They may all be obtained from butter by pressing out the portion which remains liquid at 15.5°C ., saponifying this oil, and distilling the soap which is thus formed with sulphuric acid. The liquid

which passes over contains, along with butyric acid, these three acids, which, by being converted into bayta salts, are separable from one another. All three of these acids are also obtained by the oxidation of oleic acid by nitric acid; and capric acid is also obtained by acting upon oil of rue with fuming nitric acid; hence it is frequently called *rutic acid*. Each acid forms a series of salts, Caproates, Caprylates, and Caprates; but the inorganic ones, such as those containing barium, potash, and soda are of little importance. The Ethyl and Methyl salts, however, resemble each other, and by virtue of their pine-apple flavour, similar to that of Butyric Ether (q.v.), are sometimes used in making artificial fruit-essences.

Capsella. See SHEPHERD'S PURSE.

Capsicum, a genus of Solanaceæ, yielding the powerful condiment variously known as Pod Pepper, Red Pepper, Guinea Pepper, Chillies, Capsicum, &c. The species are all of a shrubby, bushy, appearance, and have more or less woody stems, although they are annual or biennial plants. Some of them are in very general cultivation in tropical and subtropical countries for their fruit, which is extremely pungent and stimulant, and is employed

Capsicum annuum.

in sauces, mixed pickles, &c. (*Chillies*), or dried and ground (*Cayenne Pepper*). It aids digestion, and prevents flatulence; while it furnishes a useful local stimulant, used especially as a gargle, and sometimes also as a liniment. The so-called *capsicin* is a mixture of resinous and fatty matters, with a volatile alkaloid. The species and varieties are not easily discriminated.

Capsule, in Botany, a dry fruit, formed of several united carpels (syncarpous). When the placentation is parietal or free-central (see PLACENTA), the capsule is of course one-celled; when axile, it is two or more celled. It may open by valves variously placed (see DEHISCENCE), as in foxglove, primrose, and rhododendron; or by pores, as in the poppy or snapdragon; or by a circular slit, as in the pimpernel or monkey-pot (see FRUIT). In bryophytes (see MOSSES, LIVERWORTS) the capsule in which the spores are borne is really, with its stalk, the sporophyte generation. Growing from the fertilised ovum, it carries the top of the archegonium upwards as a cap (calyptra), and sends its 'foot' down into the tissues of the parent moss-plant.—The word is also applied to gum envelopes for nauseous medicines, to metallic covers for bottles, and to little saucers used in chemistry.

Captain, MILITARY, originally a *head* or *leader*, irrespective of the number of men under him, but now a company or troop commander. In the

German army, where the infantry companies consist of 250 men each, the captain was a mounted officer; in the British army he marches on foot with his men, who look to him for everything, both in barracks and in the field. The cavalry captain belongs to a squadron, of which there are three in a regiment (four in the Indian army), each commanded by a major (see REGIMENT). The Royal Artillery and Royal Engineers used to have 'first captains' and 'second captains'; these ranks are now major and captain. In the Royal Engineers and the Indian army officers are promoted to the rank of captain after ten years' and nine years' service respectively, whether in command of men or otherwise employed. In the other arms promotion only takes place when a vacancy occurs. The officers of the Army Service Corps, the Royal Army Medical Corps, and the Army Veterinary Service have now combatant rank, and pass through the rank of captain. In other departments some of the officers rank as captains, but without the title. Honorary rank of captain is given to some quarter-masters, riding masters, &c. The badges of rank are three stars on each shoulder-stap.

In Spain and some other countries the rank of *Captain-general* is still retained, and is a very high command. In Queen Elizabeth's reign there was a captain-general of footmen, and Marlborough was Captain-general of the Forces. See COMMISSIONS (ARMY).

Captain, NAVAL, is the general designation for the officer in command of a ship of the royal navy, although some vessels of war are commanded by officers lower in rank than captain. Captains rise to the command of larger ships, with increase of pay, according to length of service. The captain is responsible for everything on shipboard, in discipline, navigation, equipment—all, in short, that concerns the *personnel* or *matériel* of the ship. If his ship belongs to a particular fleet or naval station, he is responsible to the admiral or commodore; if not, he is directly responsible to the Admiralty. The captain of that particular ship in a fleet which carries the admiral is called *Flag-captain*, and has local precedence over the others. The number of captains in the naval service on the active list is limited to one hundred and seventy-five, most of whom are employed. They rank with lieutenant-colonels in the army (in the United States, with colonels); and after three years' service, with colonels. Post-captain is an obsolete title for a captain of three years' standing.

The Captain of the Fleet is a staff officer in large fleets; he promulgates the admiral's orders, and receives all the reports and returns, together with the Chief of the Staff. Among the seamen on board a ship, the chief of each gang is called captain—such as the captain of the fore-castle, of the hold, of the maintop, of each gun, &c. For half-pay captains, see HALF-PAY.

Capua, a fortified city of Italy, beautifully situated in a rich plain, on the left bank of the Volturno, 27 miles N. of Naples by rail. It has a fine cathedral, with a crypt and twenty-four ancient Corinthian columns from ancient *Casilinum*, upon whose site Capua was built in the 9th century; an antiquarian museum (1874); and a tower commemorating the sanguinary storming of the city by Cæsar Borgia in 1501. Population, 15,000.—The ancient *Capua*, which for wealth and population ranked second only to Rome and Carthage, was situated 3½ miles SE. of the present city, its site being occupied by the modern town of Santa Maria di Capua Vetere. It was founded by the Etruscans under the name of *Volturnum*, and was the chief of their twelve cities in this part of Italy. Its present name was derived from the

Samnites, who captured it in 423 B.C. After the battle of Cannæ, 216 B.C., the popular party opened the gates to Hannibal, whose army was greatly enervated by its luxurious winter-quarters here. The Romans obtained possession of the city in 211 B.C. In the 5th century A.D. Capua was devastated by the Vandals under Genseric. It recovered its prosperity again to some extent, but it was totally destroyed by the Saracens in 840. The citizens, who had fled to the mountains, were induced by their bishop to return some sixteen years later, and found the modern Capua. From the existing remains of the walls and fortifications of ancient Capua, it has been estimated that it had a circumference of 5 or 6 miles. It had seven gates. Among the Roman antiquities, one of the most remarkable is the amphitheatre, built of bricks, and faced with white marble. Well preserved arches, corridors, and seats for spectators still remain. Measuring 557 by 459 feet, and 150 feet high, it could hold 60,000 spectators, and must have been one of the most magnificent buildings of the kind in Italy. There is also a Mithræum.

Capuchin Monkey, or *CAI*, a name often given to *Cebus capuchinus*, and some other species of the genus *Cebus*, South American monkeys, which have the head covered with short hair, so disposed as to resemble the cowl of a capuchin, the face being almost naked, or only covered with a little down. *Pithecia chiropotes*, a South American monkey of a genus allied to *Cebus*, is also some times called the Capuchin of the Orinoco. *Cebus fatuellus* is known as the Brown Capuchin. The capuchin frequents wooded country in Guiana, Venezuela, and Peru; it keeps for the most part to trees, except when pillaging maize fields or the like; it is very shy, but easily tamed when young. Though the senses of sight and hearing are poor, its intelligence is very considerable, and can readily be educated. The mothers exhibit great affection for their young, and the captives soon become fond of their owners. As usual they are very thievish, inquisitive, and mischievous.

Capuchins, a branch of the order of Franciscans (q.v.), so designated from the *capuche* or cowl worn by them as their head-dress.

Capulets and Montagues, the English forms of the names of the Cappelletti and Montecchi, two noble families of northern Italy, according to tradition of Verona, chiefly memorable from their connection with the legend on which Shakespeare founded his tragedy of *Romeo and Juliet*. The first publication in which we recognise the essential incidents of Shakespeare's play is a novel by Luigi da Porto, printed at Venice in 1535. Another version was given by Bandello in 1554, and soon after a French version of the tale, by Pierre Boisteau, in Belleforest's *Histoires Tragiques*, which was translated into English in 1567, and published in vol. ii. of Paynter's *Palace of Pleasure*. Boisteau's novel had already in 1562 been formed, with considerable alterations and large additions, into an English poem of four thousand lines by Arthur Brooke, entitled *The Tragical History of Romeus and Juliet, written first in Italian by Bandell, and now in English*. There is evidence that an English play had appeared previously, and that before Shakespeare's time the story was so well known in England that it had supplied subjects for tapestries. Shakespeare's play seems to have been principally based on the English poem, almost the only variations being the compression, for dramatic effect, of the action from four or five months into as many days, and the bringing in of Paris to die at Juliet's bier by the hand of Romeo. But Shakespeare's faithfulness in following his text does not detract at all from the magnificent dramatic

intuition by which the old story has been fused into a tragedy of transcendent splendour and pathos

Caput Mortuum (Lat., 'dead head'), a phrase used by the old chemists for the residuum of chemicals after the volatile substances had escaped. It is still used metaphorically for a thing or institution which has been really destroyed though the form is left, the essence and valuable characters having been removed.

Capybara (*Hydrochaerus capybara*), the largest living rodent, nearly allied to the guinea pig. It is as large as a small pig, aquatic in its habits,

Capybara (*Hydrochaerus capybara*).

vegetarian in its diet, and often does great damage in sugar-cane plantations. It runs clumsily, but swims well, and can remain several minutes under water. The general structure is that of the guinea-pig, and differs but little except in having a grooved upper incisor tooth, and the last molar larger than those in front, and in the development of a web on the feet. It is a very plump animal, with coarse, thin, predominantly brownish hair; is inoffensive and easily tamed; and lives in pairs or families, in marshy places by rivers and lakes. Its habitat is the north of South America. It is sometimes called the water hog, which is a literal translation of its technical title. In Demerara it is called water-horse, a corruption of *water-haas*, Dutch for 'water-hare.' The flesh, except of old males, is good for eating.

Carabidae, a tribe of beetles, or coleopterous

Mormolyce phyllodes.

insects, of the section Pentamera (see COLEOPTERA). The species are extremely numerous, those already known numbering about tenthousand. They mostly feed at night on other insects, worms, snails, &c., and are extremely voracious and active, habits which are fully shared by their larvæ. One form at any rate, *Zabrus gibbus*, is exceptional in its vegetarian diet, and sometimes does considerable damage in wheat-fields. Some of them burrow in the earth; most of them live under stones, under the bark of trees, among moss, &c.; and their bodies are adapted to this mode of life, being very firm and hard. Their legs are in general pretty long, having on the anterior pair often

brush-like soles, and much more efficient than then wings. Some of them indeed are wingless, or have only rudimentary wings. Many exhibit much beauty of colour and metallic lustre. When irritated they eject an irritant, strong smelling fluid from glands situated posteriorly (see BOMBARDIER BEETLE). The Carabidae occur everywhere, even in the arctic regions, and blind forms occur in caves. With extremes of temperature they become readily dormant. The largest British species is only about an inch long, but some foreign ones are much larger. Some of the species of Carabus are among the most common British insects. Their wings are not fitted for flight.—A very large and singular insect of this tribe is *Mormolyce phyllodes*, a native of Java, which, in consequence of the extremely depressed form of its body and the expansion of its wing-cases, resembles some of the Mantidae (see MANTIS) and the insects known as Leaf insects (q.v.).

Carabobo, a state of Venezuela, between the Caribbean Sea and the state of Zamora, area, 2000 sq. m.; population, 125,000, mostly inhabiting the fertile depression of Lake Valencia, where large crops of coffee, sugar, and excellent cacao are grown. Capital, Valencia (q.v.); chief port, Puerto Cabello (q.v.).

Carabou. See REINDEER.

Caracal (*Felis* or *Lynx caracal*), a species of Lynx (q.v.) found in the warmer parts of Asia and throughout the whole of Africa; and more probably than any European species the lynx of the ancients. It is larger than a fox, about the same height, but much more powerful; of a uniform

Caracal (*Lynx caracal*).

deep chestnut or wine red colour, except two spots near each eye, the under parts of the body, and inner parts of the legs, which are white, and tufts of long black hair which terminate the ears. The young forms are spotted. The ears are about 3 inches in length. The caracal is powerful enough to tear a hound to pieces. It is often represented as of a very savage disposition, and certainly is most ill-tempered or probably semi-insane in captivity, but is capable of being tamed, and is in India employed for hunting hares and rabbits.

Caracalla, Roman emperor from 211-17 A.D., the son of the Emperor Septimius Severus, was born at Lyons, 188 A.D. He was originally named *Bassianus*, from his maternal grandfather, but his legal name, as it appears on medals and inscriptions, was *M. Aurelius Antoninus*. *Caracalla* was a nickname given him from his favourite dress, a long hooded tunic, made in the fashion of the Gauls, and so called in their language. After his father's death at Eboracum (York) in 211 A.D. he ascended the throne as co-regent with his brother *Fabius Septimius Antoninus Geta*, whom he after-

wards caused to be murdered. He next directed his cruelty against all the friends and adherents of Geta, of whom it is said as many as twenty thousand of both sexes—including the great jurist Papinianus—were put to death. Innumerable acts of oppression and robbery were employed to raise supplies for the unbounded extravagance of the despot, and to pay his soldiers. In his famous constitution he bestowed Roman citizenship on all his free subjects not citizens—who formed the majority, especially in the provinces—but simply in order to levy a greater amount of taxes on releases and heritages, which were paid only by citizens. After almost exhausting Italy by his extortions, he turned to the provinces, which had been in a great measure spared by the tyranny of former emperors. In 214 he visited Gaul, Germany, Dacia, and Thrace; and after a campaign against the Alemanni, assumed the surname *Alemannicus*. He was assassinated, at the instigation of Macrinus, prefect of the Praetorians, by one of his veterans named Martialis, on the 8th of April 217, on the way from Edessa to Carthage. All the historians combine to paint the life of Caracalla in the darkest colours. Among the buildings of Caracalla in Rome, the baths—Thermae Caracallae—near Porta Capena, were most celebrated, and their ruins are still magnificent.

Caracara, a Brazilian name applied to several of the falcon-like hawks, and especially to *Polyborus brazilensis*.

Caracara
(*Polyborus brazilensis*).

The name refers to the hoarse cry. They keep a good deal to the ground, and a web joins the base of the two outer toes to the middle one. Ibycter is a closely allied genus, and the southern caracara (*Ibycter australis*) the best-known species. Darwin, in his *Beagle* voyage, gives an interesting account of their mischievous and passionate habits. The bare skin of the face changes in colour according to the flow of blood associated with emotion. *Ibycter australis* frequents the

Falkland Islands; *Polyborus brazilensis* spreads from Brazil over a large extent of America, and even reaches occasionally the southern parts of the United States.

Caracas, the capital of the republic of Venezuela and of its Federal District, is beautifully situated in a nook in the mountains, 6 miles S. of La Guaira, its port. Built on the southern slope of the Avila (8635 feet), it is 3025 feet above the tide-level, and enjoys from this elevation a healthy air and a temperature ranging between 48° and 100° F. The streets, built at right angles, are broad and well paved. There are a handsome promenade, numerous public parks and gardens, and a statue of Bolívar; the town has excellent water and gas, electric light, telephones, electric tramways, and is the terminus of several railways. The most notable edifices are the Federal Palaces and other official buildings, including the president's 'Yellow House'; the university, whose library is open to the public; the archiepiscopal palace; the national museum; the Exhibition Palace (see BOLÍVAR); the cathedral; the magnificent basilica of St Ann; and over a score of hospitals and

charitable institutions. Besides the university, there are colleges of medicine, law, and engineering, and other technical schools, and several learned societies, and bodies devoted to the promotion of agriculture, industries, &c. Pop. 92,000. The Federal District, with an area of 700 sq. m., includes, besides Caracas and La Guaira, a number of other towns. Pop. 140,000. The neighbourhood is subject to earthquakes; in that of 1812, 12,000 citizens perished.

Caracci, or CARRACCI, a celebrated family of Italian painters, the founders of the Bolognese school of painting.

LUDOVICO CARACCI, the son of a butcher, was born at Bologna in 1555. As a student he was so snapt that his master recommended him to abandon the pursuit; but instead of that, he went to Venice and Parma, making acquaintance with the works of the great masters there, and returned to Bologna imbued with art principles quite opposed to the superficial mannerism then prevailing in his native city. In conjunction with two of his cousins, who, instructed by him, had imbibed the same ideas, he founded, in spite of great opposition, the Eclectic school which afterwards became so famous in the history of painting. The first principle of this new school was that 'observation of nature ought to be combined with imitation of the best masters.' The allied artists found numerous pupils, to whom they gave practical instructions in drawing from natural and artistic models, with theoretical lessons on perspective, anatomy, &c. So great was their success that in the course of a short time all other schools of painting were closed in Bologna. Some of the finest works of this master are preserved at Bologna—among others, the 'Madonna and Child Throned,' 'Madonna and Child Standing,' the 'Transfiguration,' and the 'Nativity of St John the Baptist.' He also engraved and etched a few of his own designs. Ludovico died in 1619.

AGOSTINO CARACCI, cousin of Ludovico, was born (1558) in Bologna. He became a disciple of his cousin, but he was of too versatile a genius to devote himself closely to any subject, though his magnificent painting of the 'Communion of St Jerome,' painted for the Certosa of Bologna, now in the gallery of that city, proves that he might have attained to very great eminence had he devoted his undivided attention to the art; but he was in the habit of abandoning his easel for literature, poetry, and engraving on copper. As an engraver, indeed, he holds an important position in Italian art. He accompanied his younger brother Annibale to Rome, and there assisted in some of the paintings in the Farnese Gallery; but his brother, who was a slave to his art, soon quarrelled with him for his inattention, and he left Rome, and went to Parma, where he died in 1602. As an engraver he ranks very high for his correctness of design and skill of execution.

ANNIBALE CARACCI, brother of Agostino, was born (1560) in Bologna, where he learned, under his father, the business of a tailor, from which he was called away by Ludovico Caracci. His progress in the study of painting was rapid, and at first he took principally for his models Correggio, Titian, and Paul Veronese. His picture of 'St Roche distributing Alms' first gained for Annibale Caracci a wide reputation. His fame reached Rome, and he was employed to paint the Farnese Gallery there, which is considered his greatest work, and the manner of which partakes somewhat of Raphael and Correggio. On this gallery he was employed some four years, and he received for his work the incredibly paltry sum of 500 crowns. After a visit to Naples he died in Rome in 1609, where his remains were interred, close to Raphael's tomb, in the Pantheon. His most celebrated easel-

picture is the 'Three Maries,' formerly in the Orleans collection, now at Castle Howard. Annibale Caracci was one of the greatest followers of Correggio, and in composition approached most nearly to the style of Raphael. Ludovico had a greater talent in teaching, and Agostino had a more versatile invention, but Annibale was unquestionably the greatest artist of the three Caracci.

ANTONIO MARZIALE CARACCI (1583-1618), natural son of Agostino, was a pupil under Annibale, and painted some excellent pictures.

FRANCESCO (styled FRANCESCHINO) CARACCI, nephew of Agostino and Annibale, was born in 1595, and distinguished himself as an eminent designer. He died 1622.—The best Italian masters of the 17th century—Domenichino, Guido Reni, Albani, and others—proceeded from the school of the Caracci.

Carac'ciolo, PRINCE FRANCESCO, was born in 1752 of a noble Neapolitan family, and had risen to the supreme command of King Ferdinand's navy, when in December 1798 he fled with him before the French from Naples to Palermo. Learning, however, of the intended confiscation of the estates of all absentees, he obtained permission to return to Naples, and there entered the service of the 'Parthenopean Republic,' in April being placed at the head of its marine. For two months he ably directed the operations of the revolutionists, and not till their cause seemed hopeless, though before the capitulation, did he quit the capital. He was captured in peasant disguise, and on 29th June 1799 was brought on board Nelson's flag-ship, tried by a court-martial of Neapolitan officers, and hanged from the yard-arm of a Neapolitan frigate. See NELSON, and books there quoted (especially Langton's); books named at HAMILTON (EMMA); Giglioli, *Naples in 1799* (1903).

Caractacus, a king of the Britons, for nine years (43-50 A.D.) warred gallantly against the Roman invaders, but at length was completely overthrown by Ostorius in a battle near the border of South Wales. His wife and daughters fell into the hands of the victors, and his brothers surrendered. Caractacus himself fled to Cartismandua, queen of the Brigantes, who delivered him up. He was carried to Rome, 51 A.D., and exhibited in a triumphal procession by the Emperor Claudius, who was greatly impressed by his dauntless bearing and language. According to tradition he died at Rome about 54 A.D., but there is absolutely no ground for supposing that the Claudia of 2 Tim. iv. 21 was his daughter. Sir John Rhys prefers the spelling (with accent) *Caratācos*.

Caraffa is the name of an ancient and famous Neapolitan family, to which several cardinals and Pope Paul IV. (q.v.) belonged.—CARLO CARAFFA, nephew of Paul IV., was born in 1517, fought in the Netherlands, joined the Knights of Malta, and was made cardinal by his uncle. Paul had ultimately to banish the cardinal and his brothers from Rome for extortion; and in 1561 Pope Pius IV. caused him to be put to death. See the work by Durny (Paris, 1883), and Canon Jenkins, *The Story of the Caraffa* (1886).

Caraites. See J.N.W.S.

Caramania is a name sometimes given to part of the central tableland of Asia Minor (q.v.), from the town of Karaman, a town of 7000 inhabitants, lying at the northern base of Mount Taurus. It is mostly in the province of Konieh.

Carambola, or COROMANDEL GOOSEBERRY, is the fruit of *Averrhoa Carambola*, a small East Indian evergreen tree belonging to the Oxalidaceæ. Its congener, *A. Bilimbi*, yields the acid fruit

known as the Bilimbi or Blimbing, and both species have been introduced into cultivation in the West Indies. They exhibit in a tolerably marked degree that sensitiveness familiar in other members of the order. See SLEEP OF PLANTS.

Carambole. See BILLIARDS.

Caramel is the name applied to the highly flavoured dark-brown substance produced by the application of heat to Sugar (q.v.). It is likewise formed during the roasting of all materials containing sugar, such as coffee, chicory, and malt (see BEER), and is one cause of the dark colour of porter and infusions of coffee. It is employed in the colouring of whisky, wines, vinegar, &c. Although caramel, as prepared by burning sugar, is used more as a colouring than as a flavouring agent, yet it, and bodies allied to it, play a very important part in nutrition. When meat is roasted, a very highly flavoured brown portion is produced on the surface. It is to this, a form of caramel, that the appetising flavour of roast meat is in part due, while to the same cause we can trace the distinctive flavour of toasted bread. The dark coloured gravy derived from roast meat owes its value in part to caramel; and recognising this, the cook frequently adds caramel or browning, as it is called, to make up for deficiencies. Experiments have shown that while life cannot be sustained on the tasteless fibrous meat from which the juices have been removed by water, yet the addition of caramel enables it to be assimilated as food.

Caran d'Ache (French spelling of the Russian for 'lead-pencil'), the name by which Emmanuel Poiré (1858-1909) chose to be known as a caricaturist. Born in Moscow, the grandson of a French prisoner of 1812, he settled in France, became a draughtsman in the War Office, and was soon known by his caricatures in various periodicals. Collections of his work appeared in *L'Album* and *Les Maitres Humoristes* (1907). Some of his later caricatures were toy pictures cut in thin wooden board.

Carapace, a term applied to the shield on the back of such crustaceans as Crab and Lobster, of the unique King Crab or Limulus, or of chelonians like Tortoise and Turtle. In the former cases it is a chitinous and calcareous cuticle (a product of the underlying living skin); in the last it consists of backbone and ribs, added to by dermal scutes and covered with epidermic scales.

Carat. Goldsmiths and assayers divide the troy pound, ounce, or any other weight into 24 parts, and call each a carat, as a means of stating the proportion of pure gold contained in any alloy of gold with other metals. Thus, the gold of our coinage and of wedding-rings, which contains $\frac{22}{24}$ of pure gold, is called '22 carats fine,' or 22-carat gold. The lower standard, used for watch-cases, &c., which contains $\frac{18}{24}$ of pure gold, is called 18-carat, and so on. The carat used in this sense has therefore no absolute weight; it merely denotes a ratio. This, however, is not the case with the jewelry carat used for weighing diamonds and other precious stones, pearls, &c., which has a fixed weight, and is divided into quarters, or 'carat grains,' eighths, sixteenths, thirty-seconds, and sixty-fourths. These carat grains are less than troy grains. Even the carat with fixed weight varied in various countries—from about 216 milligrams in Leghorn to 195 in Florence. In England it was 205.4090 milligrams; in France, 205.5000. The metric carat (abbreviated C.M.) of 200 milligrams came rapidly into general use throughout the world, and in 1914 it became compulsory in the United Kingdom.

The name seems to come through the Arabic *qirrat* from the Greek *keration*, the fruit of the Carob (q.v.),

used also as a weight. The origin of the word has also been sought in *Kuara*, the native name of the *Erythrina Abyssinica*, or coral-tree, the seeds of which, it is said, were very equal in size, and were used for weighing gold and precious stones.

Caravaca, a town of Spain, 40 miles NNW. of Murcia, in a rich wine country, has manufactures of woollen fabrics, soap, paper, leather, brandy, and oil. Pop. 16,000.

Caravaggio, a town in the Italian province of Bergamo, 3 miles SE. of Treviglio by rail. It has a famous church, *L'Apparizione della Madonna*, to which pilgrimages are made, and is celebrated as the birthplace of the painters Fermo Stella, Polidoro Caldara, and Michelangelo Merisi, all three surnamed Caravaggio. Pop. 9000.

Caravaggio, MICHELANGELO MERISI, or MORIGI DA, a celebrated Italian painter, was born in 1569 at Caravaggio (see above). His father, who was a mason, employed him in preparing plaster for the fresco-painters of Milan, and in this way the artistic genius of the boy was stirred. After studying the works of the great masters in that city for five years, and afterwards in Venice, where his colouring was for a time influenced by the paintings of Giorgione, he went to Rome, where he lived for some time in very reduced circumstances. At length a picture of his attracted the notice of Cardinal del Monte, who now patronised the young artist; his works became for a time popular, and even such painters as Guido and Domenichino found it necessary to imitate his style. But the ferocious and quarrelsome character of Caravaggio soon involved him in difficulties. Having fled from Rome to Malta on account of manslaughter, he obtained the favour of the Grand-master by painting an altar-piece in the church of St John, and other pictures. His fiery nature soon forced him to flee from Malta; and in making his way back to Rome, he was wounded, lost all his baggage, caught a violent fever, and on reaching Porto Ercole, lay down on a bank and died (1609), at the age of forty. Transcript of ordinary and often debased nature was the object aimed at by Caravaggio, who left the schools; and devoted himself to painting life as he found it in lanes, alleys, and other resorts of the lower classes. He studied no such matters as refined sentiment or the elevation of realities, but gave in his paintings expression to his own wild and gloomy character. His chiaroscuro is forced and untrue, but very effective. When he painted sacred subjects, he still remained faithful to the low realities of Italian life; so that several of his pictures executed for churches had to be removed from their places, on account of their want of harmony with sacred surroundings. Kugler, the German critic, has justly said of one of Caravaggio's most celebrated works, a 'Burial of Christ,' that it appears 'like nothing better than the funeral of a gypsy-chieftain.' One of his best paintings, 'The Fraudulent Gamblers,' is preserved in the Sciarra Gallery at Rome; his 'Christ and the Disciples at Emmaus' is in the National Gallery, London; and several of his works are in the Berlin Museum. See monograph by G. Rouchès (Paris, 1920).—For an earlier and less celebrated Italian painter, POLIDORO CALDARA DA CARAVAGGIO, see CALDARA DA CARAVAGGIO.—The name is shared by yet another painter, FERMO DA CARAVAGGIO, otherwise Fermo Stella.

Caravan (Persian *karwān*), in Africa and the East, a large company of travellers associated for mutual help and protection. Caravans following a sandy desert route employ camels, sometimes as many as 1000, which follow each other in single file; in journeys through a steep and rocky country, mules and asses are used. The term is pro-

perly confined to trading assemblages alone; for the caravans formed by pilgrims going to Mecca, the most famous of which are those which annually assemble at Cairo and at Damascus, see HAJJ. In trade-caravans, a leader, who is called *Karwan-Bashi*, or simply *Reis* ('chief'), is elected by the merchants from their own number. The leader of the Mecca caravans is called *Emir-el Hajj* ('prince of the pilgrims').

CARAVANSERAI, or KHANS, are the buildings erected in the East, generally as a pious charity, for the shelter of caravans or travellers; they are unfurnished, water only being provided. Generally erected just outside the walls of a town or village, they commonly consist of a square building of four wings built round a court-yard, in which the beasts of burden may be inclosed, and where there is usually a well, with a fountain-basin beside it; the lodgings are small rooms, generally on a second story, built over the arcade and storerooms which run round the court-yard. Always massive and strong, the buildings are often handsome and well proportioned; but in too many instances they have been allowed to sink into dilapidation and even ruin.

From 'a moving company, cavalcade, company in motion—e.g. out for a picnic,' *Caravan* had come in 1689 to mean a large covered car or conveyance capable of carrying such a company. Thence the transition was easy to the 'chimneyed house on wheels' of the Gypsy, the showman, or Dr Gordon Stables; and caravanning is now an accepted form of holidaying—as in the Countess von Aini's *Caravanners* (1909).

Caravellas, a Brazilian port, 475 miles NE. of Rio de Janeiro, on the Caravellas, 5 miles from its mouth. It exports fish-oil, coconuts, and coffee. A railway connects it with the interior. Pop. 4000.

Caraway (*Carum Carvi* or *Carui*), a species of Umbelliferae, which has long been cultivated in Europe and elsewhere for the sake of the well-known aromatic 'caraway seeds' which it bears; these being, however, in strictness not seeds, but the *mericarps*, into which the fruit in this order splits when ripening (see UMBELLIFERÆ). Their properties are due to the volatile caraway-oil, which is contained in the large oil-glands (*vittæ*) of the fruit, and is distilled on a large scale, chiefly for the preparation of the liqueur known as *kummel*, but also for use in perfumery and in pharmacy, as an aromatic stimulant and flavouring ingredient. Caraways are, however, chiefly used entire as a spice by bakers and confectioners, and the cultivation of the plant thus attains considerable importance, particularly in Germany and Holland. To the same genus *Carum* belong also parsley, and ajowan, whose seeds yield thymol.

Carbides, formerly termed *carburets*, are the compounds of carbon with the various metals. It is to the addition of carbon, in one way or other, that the valuable properties of cast-iron and steel are due. For the carbide of calcium, see CALCIUM; also ACETYLENE, GAS (LIGHTING); and Leeds and Butterfield, *Calcium Carbide and Acetylene* (1903).

Carbine is a very short rifle, which until recently was carried by cavalry soldiers, and on the limbs of the horse and field artillery. These troops are now provided with the infantry rifle, and the stock of carbines is used by school cadet corps. The weapons are not sighted to so long a range as the rifle, but are of the same calibre, with a smaller charge of the cordite explosive in the cartridge.

Carbineers, or CARABINEERS, meant formerly light horsemen, used chiefly to watch and harass the enemy, defend narrow passes, and act as

skirmishers. A corps under this name was raised in France in 1560; but the designation is no longer used in that country. In the English army all cavalry were at one time often styled carbineers, but now there is only one regiment, the 6th Dragoon Guards, known by this title; and the distinction between them and other heavy cavalry is merely nominal.

Carbohydrates, a class of chemical compounds of carbon, hydrogen, and oxygen, the two last in the same proportion as in water. See for the various members of the class the articles CELLULOSE, DEXTRINE, INULIN, STARCH, SUGAR; also DIET, DIGESTION, FOOD.

Carbohydrogens. See HYDROCARBONS.

Carbolic Acid, or PHENOL, C_6H_5OH , is one of the most important substances derived from coal-tar. Although called an acid, and forming salts, it is neutral to test-paper, and has more in common with the alcohols than with the acids (see ACIDS and ALCOHOLS). It is obtained by distilling coal-tar, reserving the portion passing over between 356° and 374° (180° — 190° C.). After rectification, this constitutes the crude carbolic acid used so largely for disinfecting purposes. By careful purification it can be obtained pure, when it forms minute white or colourless plates or needles, possessing a burning taste, and an odour resembling that of creosote. By exposure to the air it becomes pinkish, but is not otherwise injured. It rapidly absorbs water from the air, forming an oily liquid, which does not readily mix with water until about 15 volumes have been added, when it forms a solution. Carbolic acid is apt to be confounded with cresylic acid and creosote, which possess an odour somewhat similar. This remark applies only to the liquid acid, as neither of these substances can be crystallised. Liquid carbolic acid has no action on polarised light, in this respect differing from creosote. Carbolic acid is readily soluble in alcohol, ether, chloroform, glycerin, olive-oil, and volatile oils. Although called an acid, it forms but very weak combinations with the alkalis, some of the so-called carbolates used for disinfecting purposes being probably only earthy substances mixed with carbolic acid.

In solution carbolic acid coagulates albumen, arrests fermentation, destroys parasites, whether animal or vegetable, and prevents moulding or putrefaction. Owing to these valuable properties it has come largely into use as an antiseptic and disinfectant. Applied to the cavity of a decayed tooth it quickly relieves certain forms of toothache, acting as a local anæsthetic. Owing to its powerful action on the mucous membranes, it must not be allowed to touch the interior of the mouth. Taken internally, concentrated carbolic acid acts as an irritant poison, accompanied by a numbing of the stomach, which prevents the action of emetics. The antidote for carbolic-acid poisoning is any soluble sulphate. Medicinally, carbolic acid may be given in doses of one to three grains dissolved in glycerine or water. See ANTISEPTIC SURGERY.

Carbon (sym. C; at. wt. 12), one of the most widely diffused elements, occurs uncombined in Black Lead (q.v.), and in the Diamond (q.v.). It is much more abundant, however, in a state of combination. United with oxygen, it occurs as Carbonic Acid, CO_2 (q.v.), in the atmosphere, in natural waters, in limestone, dolomite, and ironstone. In coal it is found combined with hydrogen and oxygen; and in plants and animals it occurs as one of the elements building up wood, starch, gum, sugar, oil, bone (gelatin), and flesh (fibrin). Indeed there is no other element which

is so characteristic of plant and animal organisms, and it ranks as the only element never absent in substances obtained from the two kingdoms of organic nature. Wood charcoal, coke, lampblack, and animal charcoal are artificial varieties, more or less impure, of carbon. The specific gravity of the different forms of carbon greatly varies; that of the diamond being 3.330 to 3.550, while graphite is only about 2.300. Carbon, in its ordinary forms, is a good conductor of electricity: in the form of diamond, it is a non-conductor. Of heat, the lighter varieties of carbon, such as wood charcoal, are very bad conductors; graphite in mass has very considerable conducting powers. At ordinary temperatures, all the varieties of carbon are extremely unalterable; so much so, that it is customary to char the ends of piles of wood which are to be driven into the ground, so as by this coating of non-decaying carbon to preserve the interior wood; and with a similar object, the interior of casks and other wooden vessels intended to hold water during sea-voyages, is charred (coated with carbon), to keep the wood from passing into decay, and thereby to preserve the water sweet. Even as regards combustion there is a marked difference. Wood charcoal takes fire with the greatest readiness, bone-black (animal charcoal) less so; then follow in order of difficulty of combustion—coke, anthracite, lampblack, black lead, and the diamond. Indeed, black lead is so non-combustible, that crucibles to withstand very high temperatures for prolonged periods without breakage or burning, are made of black lead; and the Diamond (q.v.) completely resists all ordinary modes of setting fire to it. In the property of hardness carbon ranges from the velvet-like lampblack to diamond, the hardest of gems. In 1879 it was announced that a method of producing pure crystallised carbon, or diamond, had been discovered, but, so far, the artificial crystals obtained have only been of small size. See MOISSAN.

Besides the physical properties already alluded to, carbon possesses very remarkable absorbent powers; enabling it not only to decolourise syrupy liquids (see CHARCOAL, ANIMAL), but also to absorb gases. Thus freshly ignited wood charcoal will absorb ninety times its own volume of ammonia gas, and sixty-five times its volume of sulphurous anhydride gas. Owing to this property it has many important uses. When employed in the construction of respirators, so arranged that the air is drawn through a layer of charcoal, it is possible to breathe an atmosphere which otherwise would be irrespirable. Water and wine which have become tainted may be readily rendered wholesome by means of charcoal; while as a tooth-powder its value lies in the absorbent power referred to. But see BISCUITS. Gardeners find that when it is mixed with potting-soil it prevents the souring of the soil, which is so injurious to the finer varieties of plants.

Most of the filters so much in use nowadays for the purification of water contain charcoal, which not only removes organic matter, but even lessens the hardness of the water. For decolourising liquids bone-black is preferable. The varieties of carbon, as mentioned above, differ very considerably in the readiness with which they combine with oxygen; but when burned they all yield Carbonic Anhydride, CO_2 (see CARBONIC ACID). Carbon forms another oxide, called carbonic oxide, CO, when it is burned with only a limited supply of air. When heated with sulphuric acid carbon decomposes it, forming carbonic acid and sulphurous anhydride. Thus:

Carbon unites with metals to form Carbides (q.v.), the chief of which are those of iron. With hydrogen carbon forms a very important class of organic compounds, including such unlike substances as turpentine, oil of lemon, $C_{10}H_{16}$, and marsh gas, CH_4 . As carbon unites with nearly all the elements to form chlorides, bromides, &c., the number of carbon compounds is virtually unlimited (see AROMATIC SERIES), and those already known far surpass in numbers all other chemical compounds put together. When carbon is obtained sufficiently dense, it is found to be a good conductor of electricity, and to make an excellent electro-negative element in a galvanic pair. For this purpose graphite and the hard incrustation of carbon found in gas retorts are admirably suited; but, owing to their comparative scarcity, recourse is had to an artificial method of preparing dense carbon, devised by Professor Bunsen of Heidelberg. The carbons thus obtained for galvanic batteries, owing to their efficiency and cheapness, have given a great impetus to electrical work. The following are the more important steps in the process: A mixture of two parts of coke and one of coal in powder is placed in an iron mould and heated in a furnace. As soon as the liberation of gas has ceased, the mould is allowed to cool, and on opening it a carbon block is obtained which may be ground to the desired size. Although hard, it is still far too porous, and to remedy this it is soaked in thick gas-tar, allowed to dry, and finally heated in a fireproof crucible for some time. A second or even third time this may be repeated, care being taken to prevent the access of air to the crucible, and eventually a carbon very dense, sonorous when struck, and a good conductor of electricity, is obtained.

For a reference to the manufacture of charcoal, see separate article; and see ELECTRIC LIGHT.

Carbona'do, a form of carbon resembling hematite, but akin to the diamond, used like black diamonds in Boring (q.v.). See DIAMOND.

Carbonari (literally 'colliers' or 'charcoal-burners'), the name of certain secret societies, which flourished both in Italy and France at the beginning of last century. The aim of the societies was the overthrow of the despotic and reactionary governments then existing. They originated in Italy while under the rule of the Bonapartes. Botta, in his *Storia d'Italia*, states that, under Murat's government, the Neapolitan republicans, equally hating the French and King Ferdinand, escaped about 1808 into the wild defiles of the Abruzzi, and here, naming themselves 'Carbonari,' formed a secret society. The name of Carbonari was taken from the trade of charcoal-burning pursued in that part of Italy, and a great deal of the peculiar phraseology used in reference to their organisation and their proceedings was drawn from the same source. Thus one of their lodges was called a hut (*baracca*); an ordinary meeting, *vendita* (a sale); a meeting of great importance, *alta vendita*. But much of their ceremonial and phraseology was drawn from freemasonry and the Christian religion. Their motto or war-cry was 'Vengeance for the lamb torn by the wolf.' There were four grades in the organisation, with mystic rites of initiation. The name has been more recently extended to the revolutionary and republican organisations of Spain and Portugal.

The Carbonari played a considerable part in Italian history. Murat, the Bonapartist king of Naples, repressed them for a time, their leader Capobianco being put to death; yet they helped to overthrow French rule in Southern Italy. After the Bourbon restoration in 1815 the discontent continued, and Carbonarism attained to its greatest degree of prosperity. Priests, officers of the army,

and even women joined the organisation, which included among its members Charles Albert (afterwards king of Sardinia), Lord Byron, Silvio Pellico, and Mazzini. In 1820 its membership, variously estimated at 300,000 and 700,000, included most of the patriotism and intelligence of Italy. But its strength was broken through the unsuccessful risings of 1820 and 1821, the power of Austria, and of the reaction being too great for revolutionary Italy. Subsequently the more active portion of the revolutionary party in the peninsula was absorbed by the 'Young Italy' movement (1831) of Mazzini.

After the restoration of the Bourbons several secret political unions were formed in France, and in 1820 were confederated with the Carbonari. Paris, after the prosecutions against the secret societies of Italy, was made the headquarters of a Carbonarism which, adopting all the symbolic phraseology, rules, and regulations of the Italian societies, received from the rapidly systematising genius of the French an organic character which it had never before possessed. Lafayette was president of the supreme board, and many students and inferior officers in the army joined the societies. The initiated styled themselves *bons cousins*, and spoke of the uninitiated as *pagani* (heathens). Written documents and communications were strictly prohibited by the heads of the union, and treachery was to be punished by assassination. Following the example of their Italian brethren, the French Carbonari in 1821 attempted risings in several towns in France. Though unsuccessful, they revealed the considerable numbers and effective organisation of the societies, and they survived in sufficient strength to take a part in the revolution of July 1830. After that event several of the leading French Carbonari attached themselves to the new régime, and their society was gradually dissolved. In its place the new *Charbonnerie Démocratique* was founded, having for its object the establishment of a republican government on the communistic principles of Babeuf (q.v.). But this form of Carbonarism did not long continue. Since 1848 Carbonarism generally has disappeared. The discontent that produced it has either been satisfied by the concession of constitutional government, or has found expression in later phases of the revolutionary movement. See Heckethorn's *Secret Societies* (1875; new ed. 2 vols. 1897).

Carbonated or Acidulous Waters are those which contain a great excess of carbonic acid gas. They may be divided into the artificial and the natural. The former are treated of under Aerated Waters (q.v.), and the latter under Mineral Waters (q.v.).

Carbondale, a city of Lackawanna county, Pennsylvania, on the Lackawanna River, 16 miles NNE. of Scranton by rail, with foundries and planing-mills, and rich beds of anthracite coal. Pop. 19,000.

Carbonic Acid, CARBON DIOXIDE, or CARBONIC ANHYDRIDE, also called Fixed Air or Chokedamp, exists as a normal constituent of the atmosphere, of which it forms about $\frac{1}{1000}$ th part. While enormous quantities of it are poured into the atmosphere by the respiration of animals and by the combustion of fuel in our furnaces, this proportion scarcely seems to vary; for, as plants absorb carbonic acid by the leaves, and therefrom obtain the carbon necessary for the formation of wood, they remove it as fast as it is produced, and thereby keep the atmosphere in a state suitable for animal life. Carbonic acid also exists in combination as *carbonates*, the most largely distributed of which are the carbonate of lime, $CaCO_3$, either alone, or in combination with mag-

nesium as *dolomite*, the blackband ironstone (carbonate of iron, FeCO_3), malachite (basic carbonate of copper, $\text{Cu}_2\text{H}_2\text{O}_3\text{CuCO}_3$), &c. The term *carbonic acid* is hardly a correct one, and it is better to call the gas, CO_2 , carbon dioxide or carbonic anhydride, reserving the term carbonic acid for the solution in water. The gaseous carbonic acid is represented by the formula CO_2 , and contains 12 parts of carbon and 32 parts of oxygen by weight. It is a very dense gas, having a specific gravity of 1.529, that of air being 1.000. In consequence of this it can be poured from one vessel to another like a liquid; while in vats in which it is being disengaged by fermentation, it remains at the bottom, for some time even when freely exposed to the air, giving rise to fatal accidents when workmen carelessly enter them. Carbonic acid is a colourless gas, possessing a pleasant acidulous taste. Under a pressure of about forty atmospheres (600 lb. per square inch) it becomes condensed to a liquid. When the liquid carbonic acid is allowed to escape through a small jet, it rapidly evaporates and produces intense cold, with the result that a certain portion becomes frozen into a solid resembling snow. The solid carbonic acid volatilises without becoming liquid, and by the low resulting temperature produces strange phenomena. Thus when pressed on the skin it produces the sensation of burning, and when thrown into a hot crucible along with mercury, the latter (under suitable conditions) becomes frozen into a solid mass.

At ordinary pressures carbonic acid is soluble in about its own bulk of water, its solubility increasing with increased pressure. This property is taken advantage of in the manufacture of Aerated Waters (q.v.). Carbonic acid is used in the sugar industry and in the artificial preparation of ice. It is non-combustible, and it does not support combustion or animal life. A lighted taper is immediately extinguished when plunged into a vessel containing carbonic acid, and this simple experiment is used to test if workmen may safely enter a vat which has contained the gas. Although irrespirable by itself, acting as it does, like water, by causing spasm of the glottis, it can be breathed when diluted with air, and in such circumstances it acts as a narcotic poison, even so small a proportion as 4 per cent. acting rapidly. In much less quantity it causes depression and headache, but in aerated water works, where carbonic acid gas is liberated in quantity, it has never produced this effect, probably owing to the efficient ventilation. The French suicides who make use of a charcoal fire to terminate their existence, are partly poisoned by the carbonic acid, and partly by the Carbonic Oxide (q.v.) produced by the burning carbon.

Carbonic acid may be very readily prepared from chips of marble, water, and hydrochloric acid, which

are placed in a glass bottle furnished with suitable tubes (see fig.). The hydrochloric acid, HCl , acts on the marble, CaCO_3 , forming chloride of calcium, CaCl_2 , and water, H_2O , while the carbonic acid gas, CO_2 , escapes with effervescence, and may be collected in suitable vessels. Carbonic acid, as indicated before, is the principal product of combustion; the carbon of the burning substance (wood, coal, paper, coal-gas, &c.) uniting with the oxygen of the air to form carbonic acid. It is also a product of Respiration (q.v.), and is evolved more or less largely by all animals not only by the lungs, but also by the skin. During the Fermentation (q.v.)

of beer or wine it is liberated, while decaying vegetable or animal matters give off the gas in quantity. There is a popular prejudice against having plants in a bedroom during the night-time. This is based on the fact that plants give off carbonic acid in the dark, while they absorb it during the day. Plants also liberate carbonic acid during the flowering season, but the total amount from these two sources is so very small, that a single gas-burner will vitiate the air of a room more rapidly than a large collection of plants. The prejudice based on the carbonic acid theory seems therefore to be practically groundless. Carbonic acid forms two classes of salts, called *carbonates* and *bicarbonates*. The bicarbonates differ from the carbonates in containing twice as much carbonic acid gas relatively to the base. Thus carbonate of soda, Na_2CO_3 , may be regarded as consisting of soda, Na_2O , and carbonic acid, CO_2 ; while the bicarbonate, represented in the same way, would be $\text{Na}_2\text{O} + \text{H}_2\text{O} + 2\text{CO}_2$, or shortly, 2NaHCO_3 (see SODA, SODIUM). The bicarbonates very readily lose the extra molecule of carbonic acid, yielding then the ordinary carbonate. For carbonates of potash and of iron, see POTASSIUM, IRON AND STEEL.

The bicarbonate of lime is interesting as being the form in which most of the lime present in drinking water is held in solution. When the rain, impregnated with carbonic acid from the atmosphere, or charged with the gas from subterranean sources, percolates down through a chalky soil, it dissolves the chalk, or carbonate of lime, CaCO_3 , forming a bicarbonate, and thus becomes what is known as a *hard* water. Such a water may be readily *softened* by boiling, when the carbonic acid escapes, and the chalk, no longer soluble, falls to the bottom. This gives rise to the domestic phenomenon known as the furring of the kettle. A solution of slaked lime in water (the lime-water of the shops) forms a ready test for carbonic acid. Thus, if a little be placed in a wine-glass, and a steady stream of expired air from the lungs be blown into it, a turbidity will soon be noticed, due to the formation of carbonate of lime. On continuing to blow, the carbonic acid dissolves this up, and a clear solution of bicarbonate is obtained.

Other carbonates, such as those of silver, iron, copper, baryta, &c., are not of sufficient importance to warrant further notice here.

Carbonic acid in solution forms a refreshing drink in feverish states of the system, while in nausea and gastric irritation its value is very considerable. It acts also as a diuretic, and probably, when taken in moderation, as a stomach tonic. Owing to its sparkling properties it is used to conceal the taste of many drugs; and the granular effervescing preparations, such as citrate of magnesia, now so widely known, have come into use mainly on account of the ease with which nauseous drugs may be administered under the guise of an effervescing drink. In the form of gas, carbonic acid is said to be beneficial in the irritable states of the larynx, owing to its exercising a slight local anæsthetic action.

The carbonates possess mainly the medicinal properties of the bases, than which they are less irritating, the soda, potash, lime, and magnesia salts being recognised antacids. The magnesia salt, in the form of the bicarbonate, is well known as 'fluid magnesia,' which possesses both antacid and aperient properties.

Carbonic Oxide is the lower oxide of Carbon (q.v.), and is represented by the formula CO . It consists of 12 parts by weight of carbon and 16 parts of oxygen. It does not occur naturally, but may be observed burning with a pale-blue flame in fireplaces and stoves, especially in frosty weather. During the combustion of the fuel at the

lower part of the grate the oxygen of the air unites with the carbon of the fuel to form carbonic acid, CO_2 ; and this gas rising up through red-hot coal or carbon, C, has part of its oxygen abstracted by the carbon, and two molecules of carbonic oxide, CO , are produced, which taking fire on the top of the coals, burn with the characteristic blue flame, abstracting more oxygen from the air, and re-forming carbonic acid, CO_2 . Carbonic oxide can be prepared for experimental purposes by heating in a retort a mixture of oxalic acid, $\text{H}_2\text{C}_2\text{O}_4$, and sulphuric acid, H_2SO_4 , when the latter abstracts the water from the oxalic acid, and the other elements, C_2O_3 , escape as carbonic acid, CO_2 , and carbonic oxide, CO . On passing the mixed gases through a solution of potash, KOH , the carbonic acid is retained as carbonate of potash, K_2CO_3 , whilst the carbonic oxide remains as gas. Carbonic oxide is a transparent, colourless gas, with an oppressive odour. It is rather lighter than air, its specific gravity being only .968. In this it differs very markedly from Carbonic Acid (q.v.). For many years it resisted all attempts to liquefy it, but at last, on December 2, 1877, it yielded to the modern methods of combined cold and pressure. It burns with a blue flame, but is a non-supporter of combustion, and at once extinguishes a lighted candle introduced into it. It is very poisonous, and even when largely diluted with air, if inhaled, it produces a sensation of oppression and tightness of the head, and ultimately acts as a narcotic poison. It enters into many compounds known to the organic chemist, such as urea. It is used in Siemens's and other 'producer' gases, of which it is a principal ingredient; and is the most important reducing agent in blast-furnace processes.

Carboniferous System. The strata included under this system rest upon those belonging to the Devonian and Old Red Sandstone system, and are overlaid by the Permian. The system derives its name from the amount of coal and carbonaceous matter which it contains. It is strongly developed in the British Islands, as in Wales, the midland and northern counties of England, the central lowlands of Scotland, and over a large part of Ireland. The following are the chief divisions of the system recognised in the British area, arranged in descending order:

- | | |
|---|---|
| 1. COAL-MEASURES. | <ul style="list-style-type: none"> Red Sandstone Series. Upper Coal-bearing Series. Middle Coal-bearing Series. Lower Coal-bearing Series. |
| 2. MILLSTONE GRIT. | |
| 3. CARBONIFEROUS OR MOUNTAIN-LIMESTONE. | <ul style="list-style-type: none"> Yoredale Beds. Main or Scar Limestone. Lower Limestone, Shale (England), and Calcareous Sandstones (Scotland). |

The *Carboniferous Limestone* group is of very variable thickness, is widely distributed throughout the several districts in which the system is developed. In South Wales and the adjacent regions of England it is composed of a lower set of arenaceous and argillaceous strata, 200 to 500 feet thick, and an overlying massive gray or bluish limestone (500 feet thick) which is eminently of marine origin, being crowded with the debris of crinoids, corals, brachiopods, and other forms. Followed northward into the Pennine chain this limestone swells out to a thickness of 4000 feet, and is in that region overlaid by some 2000 feet of sandstones, shales, and limestones (Yoredale Beds). Passing into Northumberland and Scotland, the Carboniferous limestone series takes on quite a different character, the thick limestones of the more southern regions being represented by sandstones and shales, intercalated with which are seams of coal and ironstone, and only occasional beds of limestone. In Scotland the lower half of

the Carboniferous system consists of two well-defined groups—viz. the *Calcareous Sandstones*, and overlying these the *Carboniferous Limestone*. These may be taken as approximately of contemporaneous origin with the Carboniferous limestone series of England. The Calcareous sandstones comprise two groups: the lower or Red Sandstone group consisting chiefly of red, gray or white, and yellow sandstones, with subordinate beds of shale; and the upper (Cement-stone group) including a considerable thickness of white and yellow sandstones, and dark shales with beds of impure cementstones, thin limestone, coal, ironstone, bituminous shale, occasional seams of gypsum, &c. With the lower or Red Sandstone group are associated a most extensive series of volcanic rocks (chiefly andesites, basalt-rocks, and tufts) which form prominent ranges of high ground that sweep round the borders of the larger basins of Carboniferous strata. The hills that extend from the head-waters of the river Irvine to the shores of the Clyde, the Campsie Hills, the hill-ranges behind Burntisland, &c. in Fife, are examples. The Cement-stone group in the basin of the Firth of Forth is remarkable for its bituminous shales, now so largely worked for the production of mineral oils. Volcanic rocks are likewise associated with this group, but not so extensively as with the older Red Sandstone group. The Scottish Carboniferous limestone consists of a variable thickness of sandstones and dark shales, with which are intercalated seams of coal, fireclay, ironstone, and a few beds of limestone—the thickest of which rarely reaches 100 feet. The whole thickness of this series does not exceed 2700 feet as a maximum. Contemporaneous volcanic rocks occur in the series only in a few places.

In Ireland the Carboniferous system is represented chiefly by strata belonging to the mountain-limestone series. In the south and central areas the Welsh and English type appears—viz. massive limestones underlain by thick shales, &c. Towards the north the Carboniferous limestone series approximates in character to that of the Lower Carboniferous of Scotland. Contemporaneous igneous rocks are associated with the limestone series in various parts of Ireland.

The *Millstone Grit* consists of a series of grits, sandstones, shales, &c., varying in England, from 300 feet up to 5000 feet in thickness. In Scotland the maximum thickness is 900 feet, and in some districts the series is hardly recognised.

The *Coal-measures* comprise a variable thickness of sandstones, and dark shales with seams of coal, fireclay, and ironstone. In South Wales this series attains a thickness of 8000 feet or thereabout; in Lancashire, 6600 feet; in the Midland districts, an average of about 3000 feet; in Northumberland and Durham, 3000 feet; in Scotland the maximum is 2100 feet. In Lancashire and Scotland the coal-bearing strata of this series are overlaid by a set of barren red sandstones.

The changes which the Carboniferous strata undergo as they are followed from England into Scotland show that the sea in which the thick mountain-limestone accumulated shallowed away towards the north; the Lower Carboniferous strata of Scotland pointing to estuarine or brackish and fresh-water conditions, interrupted now and again by longer or shorter spells when these shallow waters gave place to terrestrial conditions. The very subordinate position occupied by the thin limestones in the Scottish series sufficiently demonstrates that the low-lying tracts of Scotland were only occasionally invaded by the sea. Thus it has come to pass that many of the most important coal-seams of Scotland occur on the same geological horizon as the pure marine limestones of England and Ireland.

The Carboniferous system appears in many other parts of the world. In Europe the most notable coal-fields after those of Great Britain are the coal-fields of Liège and Mons (Belgium), and that of Saarbruck in the Rhenish Provinces. Various coal-fields also occur in France (St Etienne, &c.), in Hanover, Westphalia, Saxony, Bohemia, and Silesia. In Russia the strata belong chiefly to the lower part of the system, and are generally unproductive. A considerable coal-field, however, occurs along the northern shores of the Sea of Azov. Carboniferous rocks likewise occur in the Western Alps, but they are generally much altered, and disturbed, and barren. They are also known in the north of Spain, where they yield some coal. In China, coal-bearing strata are extensively developed, but they are worked in a very unscientific manner. Coal of Carboniferous age is worked in Japan, and in Australia there is a considerable coal-field of the same age.

In North America the system attains a great development. The Carboniferous strata here are divided into two groups: the Lower or sub-Carboniferous (corresponding to the Carboniferous limestone of Britain) and the Carboniferous, comprising the millstone grit and the coal-measures. According to Professor Dana, the coal-bearing area of the North American continent is approximately as follows:

	Sq. Miles.
Rhode Island area	500
Alleghany area	59,000
Michigan area	6,700
Illinois, Indiana, West Kentucky	47,000
Missouri, Iowa, Kansas, Arkansas, Texas	78,000
Nova Scotia and New Brunswick	18,000

It is worthy of note that Carboniferous strata have likewise been detected in the Arctic regions, as in Melville Island, the northern coast-lands of Baffin Bay, in Bear Island, and Spitzbergen.

Economic Products.—The most important of these are of course the coals, ironstones, and limestones. The individual coal-seams vary in thickness from less than an inch up to many feet or even yards; these last, however, consist generally of several seams which have come together, owing to the thinning-out of the beds that separate them elsewhere. The total thickness of workable coal naturally varies in the different coal-fields—in some of which we may have a greater thickness of strata or a larger number of seams. In South Wales—the largest coal-field in Britain—the total thickness of coal exceeds 200 feet; in Lancashire the workable coals give an aggregate of 100 feet; in Northumberland and Durham the aggregate is 47 feet; in Lanarkshire the united thickness of workable coal-seams (true coal-measures) varies from 30 to 70 feet or more, and 15 feet in the limestone series; in Midlothian there is an aggregate in the coal-measures proper of 43 feet, and in the limestone series of 68 feet. The coals vary much in character (see COAL), some being used for ordinary household purposes, others for steam, &c., others for the production of gas, mineral oil, &c. In the American coal-measures (with a maximum thickness of 3000 feet) the maximum of included coal is 120 feet. In Britain the bedded iron ores are principally clay-ironstones, and the carbonaceous variety called Blackband Ironstone (q.v.). Hematite also occurs as very large masses in the thick limestones (Cumberland and Northumberland). Ores of zinc, lead, and antimony are likewise met with in the limestones, as in Derbyshire, Cumberland, Yorkshire, Wales, &c. The fireclays are largely worked in many places for the manufacture of bricks, &c. The sandstones likewise are held in great repute for building purposes, some, however, being much more durable than others. The thin-bedded varieties again are largely used for flags or paving-stones.

Other kinds of sandstones are employed for millstones, grindstones, crushers, &c., and some of the harder kinds for road-metal. The limestones are in extensive request for mortar, cement, agricultural purposes, &c., some of the black and coloured or highly fossiliferous varieties being in considerable demand for ornamental mason-work. Amongst the shales the bituminous kinds are the most important, but from others sulphur and sulphuric acid are extracted, while some are employed in the preparation of alum and sulphate of iron. Locally certain minerals occur in sufficient quantity to be of economic importance, such, for example, as *fluor-spar*, used for ornamental purposes, and *Baryta* (q.v.), or heavy-spar.

Life of the Period.—Among the most characteristic and abundant fossils are, as might have been expected, the plants. Among the most abundant types were Pteridosperms, seed-bearing plants, represented now and again by stems, but chiefly by their fern-like foliage, which were long believed to be true ferns, such as *Sphenopteris*, *Pecopteris*, *Neuropteris*, &c. Tree-ferns, however, did occur, and are known by their stems, such as *Caulopteris*. Besides these there were great lycopodiaceous trees such as *Lepidodendron* (q.v.), tall Equisetaceæ such as *Calamites* (q.v.), and the remarkable sigillarioid trees, as to the affinities of which there is still doubt (see SIGILLARIA). Another characteristic tree is *Cordaite*, which has relations both to cycads and conifers. Large coniferous trees (*Aracarioxylon*) are also met with now and again. The contemporaneous land-fauna has left but few traces. Here and there, however, specimens of true air-breathers are met with. Amongst these are amphibians, such as *Archegosaurus* (q.v.), millepedes, and insects of various kinds, such as extinct forms of May-flies, cockroaches, crickets, locusts, &c., and others which cannot with certainty be referred to any existing type, for they seem to have affinities with various widely separated modern forms. Scorpions abounded, and these ancient forms closely approximate in character to the living type. Land-snails have also been found, not differing much apparently from the living *Pupa*. The fauna of the seas and lagoons is much better represented than that of the land. The minute foraminifera swarmed in places—their shells occasionally forming beds of limestone. Corals were likewise extremely abundant, their remains crowding many of the limestones. Common forms are *Lithostrotion*, *Clisiophyllum*, *Zaphrentis*, *Favosites*, &c. Other great limestone-formers were the crinoids (such as *Platycrinus*, &c.), the columns and detached plates of which are among the most abundant fossils in the limestones and calcareous shales of the system. The peculiar armless blastoids, *Pentremites*, are likewise characteristic Carboniferous fossils. Crustaceans were represented by a few *Trilobites* (q.v.), the last survivors of that great family, and by ancestral forms of our ostracods, phyllopoas, and king-crabs, as well as by the extinct group of eurypterids. Polyzoa, such as *Fenestella*, are very common, as are also brachiopods; among the more frequently occurring forms being *Productus*, *Spirifer*, *Terebratula* (q.v.), &c. *Lamellibranchs* are fairly represented, especially by the *Aviculoid* group—some of the forms having apparently frequented estuaries or lagoons. Gasteropods and pteropods also occur, and are locally abundant, but they are not so common fossils as the brachiopods. Cephalopods are not infrequent, especially *Orthoceras* (q.v.), of which over 150 species are known from this system. Other notable forms are *Nautilus* (q.v.) and *Goniatites* (q.v.). Fishes are tolerably common. They come under the two groups of Ganoids and Placoids. The former are represented

by such forms as *Rhizodus* and *Megalichthys*; and the latter by numerous large and often finely sculptured fin-spines, and hard palatal crushing teeth. These large sharks preyed upon the smaller ganoids, whose teeth and scales are common in the *Coprolites* (q.v.), or fossil droppings of the former.

Carborundum, an abrasive material produced by fusing sand and coke (mixed with sawdust and salt) in the intense heat of the incandescent electric furnace. The product is a mass of bright blue crystals, nearly as hard as diamond, and more satisfactory than corundum for various kinds of work.

Carbuncle (Lat. *carbunculus*, 'a little coal'), a beautiful deep-red mineral called *Pyrope* (q.v.) by mineralogists. The carbuncle of the ancients was probably the deep-red variety of noble garnet. The mythical carbuncle laid by a goldfinch rendered its bearer invisible.

Carbuncle (so called from the redness and the burning pain), an inflammation more severe than an ordinary Boil (q.v.), is caused by some vitiated condition of the blood, or some atmospheric influence, attacking a patch of skin on the shoulders, nape of the neck, or indeed on any part of the body. The part swells slightly, feels hard, and this hardness extends deeply into the tissues; the pain is very severe, and the patient much depressed with loss of appetite, and general derangement of the secretions. As the disease advances, the redness assumes a dark purple or livid hue, the cuticle rises in blisters, and many small specks of matter appear on its surface, which discharge, and leave apertures like those in the rose of a watering-pot; through this a viscid purulent fluid escapes, and after some time the small sloughs or cores of the true skin which have been killed by the disease. In some cases the apertures meet, forming large openings, and in others the whole patch of skin sloughs and comes away.

The treatment of carbuncles consists in restoring the secreting organs to a healthy condition, the agents for which must depend on the individual case; in supporting the patient's strength by easily digested food, wine, soups, and tonics; relieving pain by opiates, and encouraging suppuration with warm poultices. Sulphide of calcium in small doses is sometimes useful in arresting the disease. Free incision is practised when the carbuncle has definitely formed, to allow the escape of the dead material; and the interior is often swabbed with pure carbolic acid. Occasionally the presence of a carbuncle is due not merely to a debilitated state of health, but to some serious constitutional disease, like diabetes. For this careful medical examination and special treatment are necessary.

Carburet. See CARBIDES, CARBON.

Carburetted Gas is used for lighting purposes. Water-gas is passed over heated hydrocarbon material. Benzene and other volatile substances mix with the water-gas, forming the mixture known as carburetted gas.

Carburetted Hydrogen is a term formerly applied to several compounds of carbon and hydrogen. For light carburetted or mono-carburetted hydrogen, CH_4 (marsh gas or fire-gas), the principal constituent of coal-gas, see GAS, METHYL. For heavy carburetted or bi-carburetted hydrogen, C_2H_4 , see OLEFIANT GAS.

Carburettor. See INTERNAL-COMBUSTION ENGINE, MOTOR-CAR.

Carcagente, a town of Spain, 25 miles SSW. of Valencia by rail, on a rich plain near the right bank of the Júcar. The plain is a vast rice-field, cut up by innumerable canals. Pop. 15,000.

Carcassonne (the *Carcaso* of Cæsar), a town in the French department of Aude, on the river

Aude, and the Canal du Midi, 56 miles SE. of Toulouse by rail. It is divided by the river into two parts, the old and the new town, which are connected by two bridges dating from 1184 and 1846. The new town is well and regularly built; but the old town or *cité*, built on a height, is much more picturesque, with its ramparts and towers, some parts of them dating from the time of the Visigoths, and the rest, with the many-towered castle, from the 11th or 13th century. In 1210 this old town suffered greatly at the hands of the fierce bigot Simon de Montfort and his crusaders, who here burned 400 of the Albigenses. In 1566 it effectually resisted the Black Prince. Of several fine churches the finest is St Nazaire. Cloth-making is the staple industry; and there are also manufactures of paper, leather, linen, and soap. Pop. 30,000. See books by Viollet-le-Duc (1858) and by Boyer (1884).

Carcharias. See SHARK.

Carcharodon, an extinct genus of sharks, the large conical and sharply notched or saw-edged teeth of which are not uncommon fossils in the Tertiary deposits. Teeth of the same character were dredged in considerable numbers by the *Challenger* expedition from great depths. See SHARK.

Car'chemish, an ancient city on the Upper Euphrates, NE. of the modern Aleppo, was long the southern capital of the Hittites (q.v.), and was a city of great size and importance. It was identified by Mr George Smith with Jerablús or Jerábs, and has been excavated since 1911.

Carcinoma. See CANCER.

Cardamine. See CRESS.

Cardamoms are the capsules of certain species of Zingiberaceæ (q.v.), particularly *Elettaria Cardamomum*, a flag-like perennial, abundant in the moist shady mountain forests of the Malabar coast, where they are largely cultivated on small clearings. The three-celled capsules contain numerous wrinkled seeds, which form an aromatic pungent spice, weaker than pepper, and with a peculiar but agreeable taste. On account of their cordial and stimulant properties they are employed in medicine, very generally to qualify other medicines; they are also used in confectionery, although not to a great extent in Britain; but in Asia they are a favourite condiment; and in Russia, Scandinavia, and Northern Germany they are used in almost every household to flavour pastry. Other plants belonging to the same order yield drugs employed under the same name, but all are of inferior value; thus *Amomum Cardamomum* of Siam, &c. yields Round Cardamoms, *A. xanthoides* Wild or Bastard Cardamom, &c.

Cardan, JEROME (Ital. Girolamo Cardano, Latinised Hieronymus Cardanus), a celebrated sixteenth-century Italian mathematician, naturalist, physician, and philosopher, was born at Pavia, September 24, 1501, the natural son of a jurist of Milan. His education was as irregular as his birth, but he finally completed his studies at the universities of Pavia and Padua, graduating in medicine at the latter. He became professor of Mathematics at Milan, at the same time practising medicine, and though at first obscure and poor, gradually gained a high reputation. In 1552 he visited Scotland, on an invitation from Archbishop Hamilton, and managed to cure the prime of an inveterate asthma, which had defied the skill of the most celebrated physicians. In 1559 he became professor of Medicine at Pavia, later at Bologna, where he continued teaching till 1570, when we find him in prison for heresy or debt, or both. Having regained his liberty in 1571, he

went to Rome, where he was speedily admitted a member of the medical college, and pensioned by Pope Gregory XII. The rest of his life he spent, without public employment, in Rome, where he died September 2, 1576, a few weeks after finishing his remarkably candid and interesting autobiography, *De Propria Vita*. Some writers have asserted, but on no sufficient authority, that he starved himself to death, to fulfil a prediction which he had made as to the time when he should die. He was a devoted astrologer, and cast horoscopes for himself and others, while he believed himself one of the five or six celebrated men who had, like Socrates, a familiar demon. Cardan was one of the most remarkable men of his age, and reveals throughout his works an intellect of rare subtlety and force, with a really sound conception of scientific method in spite of all the empiricism and imperfection of his knowledge. He too often spends his strength in merely futile attempts at explanations of natural phenomena for which the necessary data were not to be collected for centuries later; but he occasionally lets fall hints of scientific principles so profound, looked at in the light of after-years, that he himself cannot at all have even guessed at their significance. A summary of his notions on physics and metaphysics is given in his two works—*De Subtilitate Rerum*, in 21 books, and *De Rerum Varietate*, in 17 books. He wrote more than a hundred treatises on physics, mathematics, astronomy, astrology, rhetoric, history, ethics, dialectics, natural history, music, and medicine. A formula for the solution of certain kinds of cubic equations is called 'Cardan's formula,' and was published by him, as his own invention, in the *Ars Magna sive de Regulis Algebraicis* (1545); but it would appear that the formula was really the invention of Nicolo Tartaglia. His numerous writings were collected and edited by Charles Spon (10 vols. Lyons, 1663). See LIVES by Henry Morley (2 vols. 1854) and W. G. Waters (1898).

Cardboard, or **CARD**, is made by pasting together several layers of paper, according to the thickness and quality required, the outside sheets being generally white. *Bristol-board*, used by artists for pen-and-ink drawings, and many other purposes, is made in a similar manner, but of a very much finer quality of paper, and has a beautifully finished surface. According to the number of layers, they are called *three*, *four*, *six*, or *eight* sheet boards. See **MILLBOARD**, **STRAWBOARD**.

Cardenas, a seaport of Cuba, on the north coast, 75 miles E. of Havana, with which it is connected by rail. It has a good harbour, and exports sugar. Pop. 33,000, mostly whites.

Cardi. See **CIGOLI**.

Cardia (Gr.), the heart; also the upper orifice of the stomach, called, on account of its vicinity to the heart, by the same Greek name.—**CARDIALGIA** is the name commonly applied to the particular variety of pain called *heartburn*, arising from a disordered stomach, and accompanied by acid eructations. See **INDIGESTION**.

Cardiaceæ. See **COCKLE**.

Cardiff (*Caer-Taff*, 'fort of the Taff'), a parliamentary, municipal, and county borough, city with Lord Mayor (1905), and seaport, the county town of Glamorgan, South Wales, situated on the river Taff, about a mile from its mouth in the Bristol Channel. The largest town and chief seaport of Wales, in recent years it has made remarkable progress. The population rose from 2000 in 1801 to 10,077 in 1841, 56,911 in 1871, 128,849 in 1891, 182,259 in 1911, and 200,262 in 1921. Only a small percentage of these speak Welsh. Cardiff, with

the urban district of Penarth, returns three members to parliament. The city's parks cover 350 acres, the largest being Roath (166 acres). Cathays Park (60 acres), specially reserved for public buildings, contains a group of strikingly handsome edifices, all erected in the 20th century, including the City Hall, in Renaissance style; Glamorgan County Hall; Assize Courts; the University College of South Wales and Monmouthshire (first established 1883), the largest of the four constituent colleges of the University of Wales, the Registry of which is also in Cathays Park; the National Museum of Wales; and the Technical Institute. Among corporation undertakings are the water-works, electric lighting and tramways, baths, markets, abattoirs, central and branch libraries.

The port of Cardiff is the outlet for the large mineral and manufactured produce of the central portion of the South Wales mineral-field, in which are the populous districts of Merthyr-Tydvil, Rhymney, Aberdare, and the Rhondda Valley, with which this port is connected by the Taff Vale, the Rhymney, the Barry, and the Ely Valley Railways, and the Glamorganshire Canal. The port, which includes the harbours and docks of Penarth and Barry, now boasts the highest tonnage of shipping cleared at any port in the kingdom, and is the premier coal-exporting city in the world. Owing to less abundant imports, Cardiff's total shipping, entered and cleared, is surpassed by London and Liverpool. In 1912 the tonnage cleared was 9,168,115 (exclusive of coasting trade); the total exports were valued at £13,913,682, including 17,822,467 tons of coal, worth over £13,187,000—ten times the quantity exported in 1860. The growth of Cardiff began with the opening (1794) of the canal from Merthyr-Tydvil to the sea. The Bute Docks, with an area of 163 acres, constructed at the expense of the Bute estate, have cost nearly six millions sterling, and with the Glamorganshire Canal are now vested in the Cardiff Railway Company. They consist of five docks. The first, or West Bute Dock, was completed in 1839. The second, or East Dock, dates from 1854. The Roath basin followed twenty years later, and the Roath Dock in 1887. The latest, Queen Alexandra Dock, opened in 1907, has an area of over 50 acres, and is capable of taking in the largest vessels afloat. There are powerful cranes and staiths on the quays of the docks, with machinery by which the breaking of the coal is almost entirely prevented. Some of the staiths are capable of shipping 340 tons of coal per hour. There are also a tidal harbour and a low-water pier 1400 feet in length. The Penarth Docks, about one mile to the westward, form another outlet for the trade of the district. The Barry Docks (1888), of about 114 acres, add enormously to the shipping facilities of Cardiff. The imports to Cardiff include iron ore, timber (pit-props), cattle, frozen meat, foreign fruit and vegetables, corn and flour, &c. Cardiff has ironfoundries and tinplate-works; and iron and steel rank next to coal in her export tables. Shipbuilding is also a leading industry. Cardiff is on the Great Western Railway system, about 170 miles W. of London.

The ancient city of Llandaff (q.v.), now a mere village, is almost connected with Cardiff. Cardiff Castle, built in the 11th century, is partly now in ruins. The third Marquis of Bute, to whom nearly the whole of the modern town belonged, spent large sums in rebuilding the castle, using parts of it as a private residence. Robert, Duke of Normandy, brother of Henry I., died in the castle after twenty-eight years' captivity. Cromwell (1648) got possession of the castle through treachery, after bombarding it three days; and he afterwards hanged the traitor, as an example to his own

soldiery. The town was an important one, under Britons, Romans, and Normans in succession.

Cardigan (anciently *Aberteifi*, 'mouth of the Teifi'), the county town of Cardiganshire, a municipal borough and seaport on the right bank of the Teifi, 3 miles from its mouth, and 117 miles N.W. of Cardiff by rail; the population is about 3500. With Aberystwyth, Lampeter, and Adpar, Cardigan till 1885 returned one member to parliament. Remains of a castle crown a low cliff on the Teifi, which is supposed to have been founded in 1160 by a Norman baron. The town suffered much in the struggles between the Welsh and the Normans. The Teifi is said to have been the last British resort of the beaver.

Cardigan, JAMES THOMAS BRUDENELL, seventh EARL OF, born in 1797, sat in the House of Commons from 1818 to 1837, when he succeeded his father. He entered the army in 1824, and rapidly bought himself into the command of the 15th Hussars, which he resigned in 1833, on the acquittal of an officer whom he had illegally put under arrest. From 1836 to 1847 he commanded the 11th Hussars, on which he spent £10,000 a year, and which he made the smartest cavalry regiment in the service. He never was in any degree popular with his officers, and his treatment of them brought about a duel with Captain Harvey Tuckett, for which in 1841 Cardigan was tried before the House of Lords, but escaped through a legal quibble. He commanded a cavalry brigade under Lord Lucan in the Crimea, and led the famous charge of the Six Hundred at Balaklava. He was inspector-general of cavalry 1855-60, and died 28th March 1868.

Cardigan Bay is a semicircular bend of St George's Channel, on the west coast of Wales, 54 miles wide from north to south, and 35 miles deep, with a sweep of coast of 130 miles. It has 3 to 30 fathoms water, with three reefs. A strong current sweeps round the bay from south to north. Almost all the harbours on the coast are obstructed by bars.

Cardiganshire, a maritime county in South Wales, on Cardigan Bay, with a crescent-shaped coast-line of 48 miles, a maximum width of 32 miles, and an area of 693 sq. m. The surface is hilly, interspersed with fertile valleys. On the Montgomeryshire border is Plinlimmon (2469 feet); and a rugged, bleak range of hills runs through the middle of the county from the south-west to the north-east, between the coast and the Teifi, ending abruptly in a shelving beach in the middle of the coast; but on other parts there are rich flat tracts. The county does not contain much wood. The chief rivers are the Teifi, which rises in a small lake near the centre of the county, and runs 70 miles south-east and east along the southern border, the Aeron, Claerwen, Ystwith, and Rheidol. The 'sweet shire of Cardigan' contains some romantic waterfalls, especially the Rheidol Falls and the Devil's Bridge, and above twenty small lakes or llynns, noted for their wild beauty. It reposes on Lower Silurian slates and shales, containing few or no organic remains. Rich veins of copper, lead, zinc, and silver occur. Cardiganshire is an agricultural county, two-thirds of its total area being cultivated; and the rearing of live-stock is a leading industry. There are some manufactures of coarse woollens and gloves, stockings and hats. Cardigan is the county town, the other chief towns being Aberystwyth, Lampeter, New Quay, Aberayron, Tregaron. Cardiganshire sends one member to parliament. Pop. (1801) 42,956; (1861) 72,245; (1881) 70,270; (1911) 59,879; (1921) 61,292. The county has many remains of British and Roman camps and roads, stone circles, cairns, and castles.

Many Welsh princes and bards were buried in the abbey of Strata Florida, 16 miles S.E. of Aberystwyth, and some of the records of the principality were kept here. The women still wear the Welsh costume; and besides a survival of 'bride-capture,' there is a curious custom of sending 'biddings' or presents to a newly-married couple, which, when sold, often realise £50. In 1843-44 Cardiganshire was disturbed by the Rebecca riots. See Meyrick's *History of Cardiganshire* (1810).

Cardinal. The word was first used of any cleric regularly settled (*incardinated*, 'inherited') in any church, then from the 8th century of the clergy in the cathedral, the bishop being regarded as the *cardo* or 'hinge' of the diocese. Next, the forged decretals (see CANON LAW) speak of the pope as the *cardo* or 'hinge' of the whole church, and Leo IX. claims a high and singular position for the clergy of the Roman Church; but not till the time of Pius V. was the title formally restricted to its modern use, according to which it signifies the counsellors of the pope who, next to him, hold the highest dignity in the church over which he rules.

The present college of cardinals has arisen (1) from the deacons who from early times assisted the Bishop of Rome, and who were originally seven in number; (2) from the presbyters who remained in the chief church, or administered *tituli*—i.e. subordinate churches erected as need arose in the city; (3) from bishops who resided in the Roman diocese and helped the bishop proper. The *Liber Pontificalis* makes mention of such assistant-bishops in Stephen IV.'s pontificate (768-72). After many fluctuations, the number of cardinal bishops was fixed by Sixtus V. at six, of cardinal priests at fifty, of cardinal deacons at fourteen. When Benedict XV. died in 1922, the Sacred College had 61 members, 9 short of the *plenum*, which is hardly ever reached: 30 Italian, 7 Spanish, 5 French, 5 German and Austrian, 2 American, 2 English, 2 Polish, and 1 each from Ireland, Belgium, Canada, Brazil, Holland, Hungary, Portugal, and Czechoslovakia.

The appointment (*creatio*) of cardinals rests with the pope, who generally consults the existing cardinals, and often receives proposals from secular governments. The same qualifications of age, learning, character, &c., are required in the case of a cardinal and of a bishop. The cardinals in Conclave (q.v.) elect the new pope, have constant access to him, and form his chief council. They have a vote at general councils, and since the 13th century, precedence over all other members. They have quasi-episcopal jurisdiction within the churches from which they take their titles. They have had since Urban VIII. the title of 'Eminence.' The body of cardinals is called the Sacred College. Their insignia are the red cardinal's hat which is given them by the pope, and not worn, but suspended in the church of their title, and placed on the bier at death; the red *biretta*, the sapphire ring, the mitre of white silk, the purple cassock, &c. Cardinals, however, who belong to a religious order, retain the colour proper to it in their cassocks. If a cardinal holds an episcopal see, he must reside there; otherwise he must not leave Rome without permission. At the head of the college of cardinals

Cardinal's Hat.

stands the dean, who is usually Bishop of Ostia and senior of the cardinal bishops. It is he who consecrates the newly-elected pope, if not already a bishop. We must add that the chief affairs of the Roman Catholic Church are in the hands of the cardinals not as such, but as the chief members of the Roman (administrative) congregation. But the cardinals possess no constitutional rights under the absolute government of the papacy. They cannot even meet together without the pope's leave. From Pole's death (1558) there was no resident English cardinal till Wiseman's time (1850); in the United States the first cardinal was McCloskey (1875).

Cardinal Bird, or **RED BIRD** (*Cardinalis virginianus*), also called Cardinal Finch, Cardinal

Cardinal Finch
(*Cardinalis virginianus*).

Grosbeak, and Virginian Night-ingale, one of the finest song-birds of America, belongs to the family of finches or Fringillidae, and differs from the true grosbeaks (*Coccothraustes*) in having the beak slightly bulging. The general colour of the male is red, the head being vermilion, and only a small portion of the plumage around the base of the bill and on the upper throat being black. The

feathers of the crown are long, and erected into a conical crest, like a red cap. The female is fallow brown above, and yellowish brown below. The cardinal abounds in Texas, Florida, and the southern states of America generally, migrating northwards in spring, but never farther than Massachusetts, where only a few stragglers are seen. Its loud, clear, sweet, and varied song is to be heard chiefly in the mornings and evenings. In size it exceeds any of the British Fringillidae, being about equal to the starling.

Cardinal Flower. See LOBELIA.

Cardinal Points. See COMPASS (MARINERS').

Cardinal Virtues (Lat. *cardinalis*, 'chief', from *cardo*, 'a hinge'). The cardinal virtues of the ancients were Justice, Prudence, Temperance, Fortitude; and were so called because the whole of human virtue was supposed to hinge or turn upon them. This mode of dividing the virtues is to be found as far back as Socrates, and these were regarded by the Catholic Church as the moral, in distinction from the theological virtues (Faith, Hope, Charity). But this classification into cardinal virtues is manifestly somewhat arbitrary; Whewell pointed out, for example, that it wholly omits the fundamental virtue of Benevolence. See ETHICS, SEVEN.

Carding is the process of disentangling and arranging in parallel rows the fibres of cotton or the like in order to spinning. See SPINNING.

Cardinia, a genus of fossil lamellibranchs. See BIVALVES.

Cardioid (i.e. 'heart-shaped,' from Gr. *kardia*, 'heart'), a curve generated by a point on the circumference of a circle which rolls upon an equal circle. If the diameters each equal a , its polar equation is

$r = a(1 + \cos \theta)$. It meets the fixed circle in a cusp, and is elsewhere external to it. It is a particular case of the limaçon, which may be defined as a curve traced by a point, at a fixed distance from the circumference of a circle, on a radius vector to the circle from a fixed point on the circumference. Its equation is $r = a + b \cos \theta$, where a is the fixed distance and b the diameter of the circle. Obviously, if $b = a$ the limaçon is a cardioid.

Cardium. See COCKLE.

Cardona, a town of Spain, 44 miles NW. of Barcelona, on the Cardoner, with a strongly fortified castle. Close by is a celebrated mountain of salt, which has a height of about 265 feet, and measures a league round; its caves are frequently visited by parties with torches to witness its singular and beautiful reflection of the light. Pop. 4000.

Cardoon (*Cynara Cardunculus*), a perennial composite of the same genus with the Artichoke (q.v.), a native of the south of Europe and the north of Africa. It much resembles the artichoke, but is of larger size, whilst the flower-heads are smaller. It has long been in cultivation, particularly on the Continent, for the sake of the blanched leaf-stalks and midribs, which are used as a salad, or more generally as a boiled vegetable during winter.

Cardross, a village of south Dumbartonshire, on the Firth of Clyde, $3\frac{1}{2}$ miles WNW. of Dumbarton by rail. King Robert Bruce died at Cardross Castle (1329), which stood between the village and Dumbarton. The suspension of the Free Church minister in 1858 led to a famous law-suit in the Court of Session.

Cards. The positive history of playing-cards commences about five hundred years back. Many theories and assertions have been hazarded as to the earlier history and origin of cards; but with regard to all of them the verdict of 'not proven' must be returned. The three chief opinions which have been held as to the origin of cards are: (1) That they had their birth in the East, and were thence transported to Europe. (2) That though there is evidence pointing to the use of playing-cards in India and China at a remote period, the appearance of cards in Europe is due to an original invention and not to importation. (3) That there is no satisfactory evidence to show that the origin of cards was other than European.

The first opinion can claim only the respect due to antiquity. It is asserted that the Arabs, Saracens, or Moors introduced cards into Europe by way of Spain. Covelluzzo (end of 15th century) states that cards were first known in Viterbo in 1379, whence they came from the country of the Saracens; but he merely chronicles an opinion prevalent in Viterbo a century later than the time of which he speaks. Bussi, the historian, who quotes Covelluzzo, states that he was rather a credulous person. Further, cards being originally called *nabi* in Europe, and the Hebrew and Arabic words, *nabi*, *naba*, *nabaa*, conveying the idea of prophecy, it is said that the name is derived from the Arabic, and that cards were first used for the purpose of divination. But no Arabic manuscript gives the meaning of playing-cards to the word *nabi*. Dr Willshire (*Catalogue of Playing Cards in the British Museum*, 1877) says that 'the theories in support of the connection of cards with early eastern occult philosophy and thaumaturgy are of too recondite and shadowy a character to admit of satisfactory argument.'

The Indian theory is based on a supposed resemblance between chess and cards, chess being probably of Hindu origin; and on the similarities between certain Indian and European cards and games. But the differences between chess and cards are much more notable than their resemblances.

Modern critics are of opinion that India has imitated the games of Europe, for the peculiarities which link eastern and western card games existed in the latter at least as early as 1488; and Europe had no continuous intercourse with India prior to 1494. Taylor's theory that cards made their way into Europe by means of the Gypsies is dismissed by Dr Willshire with the remark that 'whether the Zingari be of Egyptian or Indian origin, they did not appear in Europe before 1417, when cards had been known for some time.' See, however, the article GYPSIES.

If cards really had an early and separate origin in China, so had gunpowder, printing, and engraving. At all events the latest authorities reject the notion that cards were imported from China into Europe.

Hence it may be safely said that it is very doubtful whether the origin of playing-cards should be looked for in the East. Assuming, as most probable, that cards appeared independently in Europe about 1350, it has to be decided in what part of Europe they were first known. The majority of those who maintain the European origin of cards assign them to Italy. Dr Willshire gives a 'decided inclination' to Italy and to 'Venice, as that particular district which so modified them by changes connected with the emblematic series, and the addition to it of a numeral sequence, as to acquire a right of parentage in respect of modern playing-cards, not readily to be set aside.' A Swiss monk, Johannes, in a MS. dated 1377 now in the British Museum, says the *ludus cartarum* came to Switzerland that very year. In the registers of the *Chambre des Comptes* of Charles VI. of France, under February 1392, is the item, '*Donné à Jacquemin Gringonneur peintre pour trois jeux de cartes à or et diverses couleurs, ornés de plusieurs devises, pour porter devers le Seigneur Roi pour son ebatement LVI. sols Parisis.*' This date (1392) has never been contested. It will be observed that the payment is made for painting, not for inventing cards; hence it is concluded that cards were already known.

Prior to the invention of playing-cards, there existed a series of emblematic pictures, which it is supposed were used for the purposes of divination and sorcery. And it is conjectured that about the middle of the 14th century some inventive genius added a series of numeral cards to the emblematic ones, and so converted them into implements of play. The designs on these combined packs, or *tarots* (so called probably because they were *tarotée* on the back—i.e. marked with plain or dotted lines crossing diagonally), were in the one series emblematic of conditions of life and of human vicissitudes (numbered also with Roman numerals in a margin above the design), and were, in the other series, similar to those now in use. The Venetian pack in the beginning of the 15th century consisted of seventy-eight cards, twenty-two emblematic, and fifty-six numerals, divided into four suits of fourteen cards each—viz. four *coat* (or court) cards, king, queen, chevalier, and valet, and ten *point* (or pip) cards numbered from one to ten. The name *atutti* (*atouts*, or trumps) was given to the emblematic cards, because they were superior to the others. The game played with these cards was called *tarocchi*.

Soon after the first quarter of the 15th century cards spread rapidly all over Europe. As cards travelled, the pack underwent a variety of modifications, and the emblematic series gradually dropped out of use, though games with *tarot* cards are still played in some parts of southern Europe. No Spanish *tarots* are known to exist. In the first instance, a pack of fifty-two numerals appears to have been used in Spain, the queens being sup-

pressed. The French similarly removed a card from each suit, but they retained the queen and abolished the chevalier. The early German numeral cards were the same as the French; but afterwards the queen was displaced, and a superior knave (Obermann) was introduced instead. England appears to have been content to adopt foreign cards as she found them, either Spanish or French, about the middle of the 15th century.

The suits of numeral cards have always been four, but the signs or marks of the suits have differed among various nations. The earliest signs were cups, money, clubs (*batons*), and swords. These marks are still retained in *tarot* cards and in Italian and Spanish numerals. The Germans early employed hearts, bells, leaves, and glands (*acorns*). During the second quarter of the 15th century, the French adopted the signs of spades (*pique*), hearts, clubs (*trèfle*), and diamonds.

The origin of the marks of the suits and their meaning has been the subject of much speculation. It is said that they were originally emblematic, cups representing Faith; money, Charity; swords, Justice; and clubs, Fortitude. A good deal of ingenuity has been expended in explaining the meaning of modern signs; but, on the whole, it seems probable they were merely chosen as being well known and easily recognised. The symbol called in England spade, is evidently the German *grun* (leaf of the wild plum), with the Italian name (*spade*) of the corresponding suit (swords). Why the French, from whom we received it, called it *pique* is not known. The English club closely resembles the German acorn (*eichel*). The French formed it like a trefoil and called it *trèfle*; when we borrowed it, we gave the suit an Anglicised Italian name, clubs (*bastoni*). The German heart survives in French and English cards, and requires no explanation. It corresponds to the Italian and Spanish suit of cups. How money (Italian and Spanish) or bells (German) became transmitted into the French *carreaux* and the English diamonds is not known. The circular symbol has become a square one, possibly from a mere love of change.

Beyond occasional alterations in the devices on the cards, the fifty-two card pack has remained much the same as it now is ever since the middle of the 15th century. But numerous improvements have taken place in the manufacture of cards, which comprises many interesting processes. Of these a brief notice is appended.

The cardboard employed is generally formed of several sheets of paper pasted together. Usually the sheet which is to form the front surface is first printed with the court cards and pips; in former days stencil-plates were used for printing the fronts. The printed sheets are then interleaved with plain ones, and the requisite number are joined together with strong paste, to form boards. The boards are then subjected to high pressure in a hydraulic press, and are afterwards dried, flattened, and rolled, preparatory to receiving a coat of colour on the back. The colour is usually formed of tinted enamel. After enamelling, the boards are once more rolled under high pressure to prepare them for the printing on the back.

The ornamentation of the backs of playing-cards requires great skill, especially in the case of the more elaborate designs, which take seven, eight, or even more printings, each of which has to be accurately registered. Numerous designs by the late Owen Jones have thus been reproduced on the backs of cards by Messrs De La Rue & Co., the well-known London manufacturers. Generally, however, the cards used in clubs have their backs plain white or red. After printing, the boards must be once more pressed and polished. They are then cut up into separate cards. Each

card is then subjected to a very careful examination, all defective or marked cards being rejected. Those which pass the ordeal are formed into packs, and the packs have finally to be made ready for sale, and sealed with a stamped wrapper. The packs are variously named, according to their degree of excellence; the best are called *Moguls*; the second quality, *Harrys*; the inferior ones, *Highlanders*, *Andrews*, and *Hailequins*. Recently very elaborate machinery has been introduced for rounding off the corners.

It has also become the fashion to place small index pips at the corners of the cards, to indicate their value without feathering them out to any great extent. The indicator system was invented by the late Dr Normandy, and was first brought out in 1860. Another improvement was that of double-headed court cards, which enables players to read the kings, queens, and knaves, whichever way they may happen to be held up. Though a great number of the technical terms used by the workpeople engaged in the manufacture of cards are of French origin, it is not in evidence that the home manufacture can be traced back to the French.

In Russia the manufacture of playing-cards was a government monopoly, and was carried on at the imperial factory in Petrograd, where an enormous number of packs were produced. In England the manufacture has attained considerable magnitude, and the consumption is on the increase. In 1861, the last year of the shilling duty, 290,660 packs were sealed. In 1862, mostly at a shilling, but a small part at threepence, about 160,000 more packs were sealed. In 1863, the duty being threepence, 732,960 packs were sealed. After 1867 the number rose to 737,120, then to 813,920; and in 1873 it exceeded a million. In 1878 duty was paid on 1,115,200 packs of home manufacture, to which must be added large numbers exported which pay no duty; in 1902, on 1,785,840. In 1912-13 duty was paid on over 3,000,000 packs, about 500,000 being imported. In the United States the manufacture has attained enormous proportions.

A duty was first imposed on playing-cards in England in 1615. The amount was five shillings per gross of packs. In the reign of Charles I. this duty was complained of by the Commons as being arbitrary and illegal, and levied without the consent of parliament. In the reign of Queen Anne (1710) an act was passed to obtain a fund 'for carrying on the war and other her Majesty's occasions,' in which it was enacted that cards should pay a duty of sixpence a pack for a term of thirty-two years. Frauds having been discovered, it was made felony, punishable with death, in a subsequent amended act, to counterfeit or forge the seals, stamps, or marks which denoted the payment of the duties. In 1719 (George I.) further provisions for preventing fraud were passed, and the term of thirty-two years was extended indefinitely. In 1756 (George II.) an additional tax of sixpence a pack was imposed, and further measures were framed to prevent fraudulent evasions. Eleven years later the duty was raised to one and sixpence a pack. In 1789, and again in 1801, the duty was further increased, by sixpenny steps, to half a crown a pack. In 1828 the half-crown duty was reduced to a shilling. In 1862 the duty was reduced to threepence in hopes of suppressing the enormous evasion of the duty which notoriously prevailed, and for other reasons. It is believed that now there is no evasion; and the amount realised greatly exceeds that collected under the shilling tax. Since 1909 the duty has been treated as an excise, not a stamp-duty. Imported cards pay a customs duty of 3s. 9d. per dozen packs. Excise receipts mount steadily, while customs revenue tends to decline.

See W. A. Chatto, *Facts and Speculations on the Origin and History of Playing-Cards* (1848); E. S. Taylor, *History of Playing-Cards* (1865); W. H. Wiltshire, *Descriptive Catalogues of Cards in the British Museum* (1877); *Playing-Cards of Various Ages and Countries, from Lady Charlotte Schreiber's Collection* (3 vols. 1892-95); Jessel, *Bibliography of Works in English on Playing-Cards* (1905); H. R. d'Allemagne, *Les Cartes à Jouer* (1906); besides separate articles on BEZIQUE, BRIDGE, CRIBBAGE, ÉCARTE, ÉUCHRE, LOO, PIQUET, POKER, WHIST, &c.

Carducci, GROSUÈ (1836-1907), by his countrymen generally regarded as the foremost Italian poet amongst his contemporaries, was born at Val di Castello, near Pietra Santa, in the province of Pisa. He was the son of a physician, and his youth was spent in study. In 1860 he was appointed to a professorship in the university of Bologna. He was throughout his life a staunch Republican, and in 1867 was for a short while suspended from his professorship for having signed an address to Mazzini. In 1876 he was returned to the Italian parliament as member for Lugo di Romagna. His earliest poems, *Juvenilia* and *Levia Gravia*, were written in imitation of Manzoni and Alfieri. Cold and artificial, they contrast strongly with their author's later works. Signs of a transition in sentiment and in style appeared in the *Decennalia*, which dealt mainly with political events of the years 1860-70. The change became complete in the *Nuove Poesie*, in which Carducci, taking Hugo instead of Manzoni for his master, gave fiery expression to the most advanced political views. These poems are remarkable for the sustained power and dignity of the language and the frequent nobility of the thought. The *Odi Barbare*, written in metres borrowed from Horace, have excited the ardent admiration of Italians; to foreign critics, however, Carducci seems in these pieces to have erred in the rejection of rhyme. Carducci has been claimed as a leader by the *veristi*, on the strength, it would seem, of his revolutionary opinions and antagonism to the followers of Manzoni. See Life by Chialini, and books by Jeanmoy (1911) and Cioce (1920).

Cardwell, EDWARD, VISCOUNT CARDWELL, was born in Liverpool, 24th July 1818, and educated at Winchester and Balliol College, Oxford. He became a barrister of the Inner Temple in 1838, and M.P. for Clitheroe in 1842. In parliament he attached himself to Sir Robert Peel, who appointed him Secretary to the Treasury (1845-46). From 1847 to 1852 he was member for Liverpool, and he was returned for Oxford city in 1852. President of the Board of Trade under Lord Aberdeen (1852-55), he carried through the Merchant Shipping Act of 1854; was Secretary for Ireland under Lord Palmerston (1859-61); and as Secretary for the Colonies under Lord Palmerston and Russell (1864-66) abolished transportation. In Mr Gladstone's Cabinet (1868-74) he was Secretary for War, and in 1871-72 carried through his great scheme of army reorganisation, which included the abolition of the purchase of commissions, the retirement of officers, the short service system and army reserve, the localisation of regiments, and improvements in military education (see ARMY). Conjointly with Earl Stanhope he was Peel's literary executor, and edited his *Memoirs* (1856-57). Raised to the peerage in 1874, he died 15th February 1886. See *Lord Cardwell at the War Office*, by General Sir R. Biddulph (1904).

Care or Carl Sunday, the Sunday before Palm Sunday, so named from the practice of eating gray peas, called carlings, fried in butter, pepper, and salt, on this day; connected with the Catholic custom of eating hallowed beans fried at this time.

Carelia. See KARELIA.

Carême. See QUADRAGESIMA.

Carême, MARIA ANTONIN, *chef de cuisine* and author, born in 1784 in Paris, where he died in 1833, wrote *Les Déjeuners de l'Empereur Napoléon*, *La Cuisine Française*, and other works connected with his craft. As Talleyrand's cook, he played an important part at the Congress of Vienna.

Caret (Lat., 'is wanting'), a character of this form, ^, denoting that something has been omitted and is interlined.

Carew, THOMAS, poet, descended from an old family in Gloucestershire, was born about 1589, and after quitting Corpus Christi College, Oxford, without a degree, studied for a while in the Middle Temple. Between 1613 and 1619 he visited Italy, Holland, France; afterwards he rose into high favour with Charles I. Carew deserves mention chiefly as the precursor and representative of what may be called the courtier and conventional school of poetry, whose chief characteristic was scholarly ease and elegance, with a spice of indelicacy and even indecency. His poems, mostly lyrical, and treating of trifling subjects, are among the best of their kind, and exhibit much fancy and tenderness. He is often said to have died in 1639. The date however, is uncertain, and he may have lived much longer. His poems appeared in 1640; see editions by W. C. Hazlitt (1870), Ebsworth (1894), and Vincent (1899).

Carex, a very large and widely distributed genus of Cyperaceæ (q.v.), commonly known as Sedges, including many hundreds of species, distributed chiefly throughout temperate and arctic climates, about 60 species being natives of Britain. Though some grow in dry situations, the majority inhabit wet and swampy soils, of which they often form almost the sole vegetation. They are of no value as fodder, and in general occur only in very inferior pastures, from which drainage generally causes them to disappear. They are sometimes of use in converting swamps into dry ground; and their creeping rhizomes are often of service in binding the sands of the sea-shore, *C. arenaria* being carefully planted along the shores and dikes of Holland. The rhizomes of this and other species are sometimes used medicinally under the name of German Sarsaparilla, but are little esteemed. The leaves of other species are used for packing, and those of *C. brizoides* are a source of the 'sea-grass' of upholsterers, which is used as a cheap substitute for horse-hair. Some of the larger growing species are sufficiently conspicuous and graceful to be worth employment in appropriate situations by landscape-gardeners, and a variegated variety of *C. japonica* is cultivated by the florist. See a book by F. C. Crawford (1910).

Carey, HENRY, poet and musician, is believed to have been an illegitimate son of George Savile, Marquis of Halifax. The date of his birth is unknown, but his first volume of poems, published in 1713, was produced when he was very young. He wrote innumerable songs, witty poems, burlesques, occasional pieces, farces, and dramatic pieces, sometimes composing the accompanying music. He published over 200 works in all. His best-known poem is 'Sally in our Alley'; there seems no sufficient ground for attributing 'God save the King' to him, as is often done. He died suddenly, by his own hand apparently, in 1743.

Carey, HENRY CHARLES, political economist, was the son of Mathew Carey (1760-1839), a journalist and publisher, who in 1784 had emigrated from Ireland to Philadelphia, where Henry was born, 15th December 1793. He early became a partner in his father's bookselling business; and when in 1835 he retired from business to devote himself to his favourite study, he was at the head of the largest publishing concern in the United

States. He died 13th October 1879. His *Principles of Political Economy* (3 vols. 1837-40) had a marked influence on economic speculation. In 1838 he published *The Credit System of France, Great Britain, and the United States*; and in 1848, *The Past, the Present, and the Future*, a work marked by great vigour and originality. In 1853 appeared the *Letters on International Copyright*; in 1858-59, *Principles of Social Science* (3 vols.); in 1867, *Review of the Decade 1857-67*; and in 1872, *The Unity of Law*. The most important of these have been translated into most European languages. Carey was originally a zealous free-trader, but was ere long recognised as the head of a new school of political economy. According to his system, free trade was impossible in the existing state of American industry; it might be the ideal towards which the country should tend, but a period of protection was an indispensable stage in the progress toward it.

Carey, SIR ROBERT, youngest son of Lord Hunsdon, was born about 1560, and rose to eminence in the service of Queen Elizabeth, for the last ten years of whose reign he was English warden on the Border marches. He was present at her death-bed (1603), and in two and a half days galloped with the news to Edinburgh. Charles I., at his coronation, created him Earl of Monmouth; he died 12th April 1639, and left Memoirs which were edited by Scott (1808).

Carey, ROSA NOUCHETTE (1840-1909), writer of stories for girls, was born in London. She began to publish novels in 1868, and from that date to her death she wrote assiduously. Her last work was published posthumously.

Carey, WILLIAM, born near Towcester in 1761, was apprenticed to a shoemaker, joined the Baptists in 1783, and three years later became a minister, first at Moulton in Northamptonshire, and then at Leicester. A pamphlet which he published about this time attracted the attention of his co-workers in the ministry to the subject of Foreign Missions, and ultimately a missionary society, chiefly through Carey's exertions, was formed. Carey and a Mr Thomas were chosen its first missionaries to India in 1793. From that time until his death on 9th June 1834, Carey was indefatigable (under many difficulties, especially during the early years) in his efforts to spread the knowledge of the gospel among the heathen. Under his direction, the Serampore mission, of which he was the principal founder, had up to 1832 issued above 200,000 Bibles, or portions thereof, in about forty Oriental languages or dialects, besides a great number of tracts and other religious works in various languages. A great proportion of the actual literary labour involved in these undertakings was performed by Carey himself, who published valuable grammars and dictionaries of Bengali, Mahratta, Sanskrit, and other languages. From 1801 to 1830 he was Oriental professor at Fort-William College, Calcutta. See his Life by Culross (1881) and Dr G. Smith (1884).

Cargill, DONALD, one of the heroes of the Covenant, was born about 1619 at Rattray in Perthshire. He studied at Aberdeen and St Andrews, and in 1655 was ordained minister of the Barony parish in Glasgow. Deprived of his benefice for denouncing the Restoration, he became an indefatigable field preacher, fought at Bothwell Bridge, and took part with Richard Cameron in the famous Sanquhar declaration (1680). Alone, in the same year, he solemnly excommunicated the king, the Duke of York, and others at Torwood, Stirlingshire. A large reward was now offered for his capture. He was soon seized, and suffered with triumphant courage at the cross of Edinburgh, July 17, 1681.

Caria, in ancient geography, the south-western-most country of Asia Minor, bounded N. by Lydia, E. by Phrygia, SE. by Lycia, and W. and SW. by the Mediterranean. A large portion of what was Caria is mountainous, with forests of oak and pine, where large herds were anciently pastured. The most important river was the Mæander, famous for its windings. Among the chief towns were Cnidus, Halicarnassus, and Miletus. The early inhabitants, who seem to have been a people of Indo-European stock, akin to the Lydians, were a warlike race, and formidable as pirates, but gradually sank into a dependent state; their princes became satraps of the Persian empire. Very early there were extensive Greek colonies, Dorian and Ionian, on the coast; and the country subsequently passed into the hands of Alexander's successors and of the Romans. It was taken by the Osmanlis in 1336, and became part of the province of Aidin.

Cariacou, or CARJACOU, also called Virginian Deer (*Cervus virginianus*), a species of deer found in all parts of North America, from Mexico to about 43° N. lat., and from the Atlantic to the Pacific Ocean. It is the species commonly called Deer by the Anglo-Americans. It is smaller and more elegant than the common stag, and measures 3 feet in height at the shoulder. The colour is very variable—light reddish brown in spring, slaty blue in autumn, and dull brown in winter; the belly, throat, chin, and inner parts of the limbs white. The horns of the adult male are of moderate size, bent strongly backward, and then suddenly forward, so as to bring their tips nearly above the nose; they have several snags. The fawn is profusely decked with white spots, arranged in lines, and sometimes running into stripes. The Virginian deer is timid, and domesticated with some difficulty. It is a common form in European zoological gardens, and also in parks. Its palatable flesh used to be one of the chief sources of food-supply to the Indians. The name Cariacou is extended generally to several nearly allied species, found in Mexico, California, &c., and the title Cariacus is sometimes used technically for a sub-generic division of *Cervus*.

Cariama (*Dicholophus cristatus*), a South American bird, regarded by some as allied to Cranes, and referred to the order Grallæ, by others as a game bird, and placed among the Gallinaceæ, but most probably ranked along with the Secretary among the Birds of Prey. The beak is hooked at the point, the forehead bears a tuft of feathers, the wings are short and little used, the tail is long and rounded, and the short claws are much bent and sharply pointed. It is larger than the common heron, predominantly brown and gray in colour, shy in habit and swift of foot, living on insects, amphibia, reptiles, and also small birds and mammals. The bird frequents the grassy regions of Guiana, Brazil, and Paraguay. Its flesh is much esteemed.

Caribbean Sea, lying between the Antilles and the South and Central American mainland, and communicating with the Gulf of Mexico by the Yucatan Channel, 120 miles wide. During the rainy season (July to October) hurricanes are not infrequent. A shallow bank extending from Honduras to Jamaica separates the two great depressions of the sea, of which the eastern and larger has a depth of 20,577, and the western 20,541 feet; and these are united by the strait (over 3300 feet) between Jamaica and Cuba and Hayti. The sea forms the turning-point of the Gulf Stream (q.v.).

Caribbee Bark, or PITON BARK, is the bark of *Exostemma caribæum* and other species, small West Indian trees of the sub-family Cinchonaceæ, growing also in southern Florida. It was once

imported as a substitute for cinchona bark, but contains none of its characteristic alkaloids.

Caribou is the American Reindeer (q.v.).

Caribs, an American Indian race, found by Columbus in possession of a large number of the West India Islands, from which they have since been either exterminated or expelled, but who still form a considerable family along the shores of the Caribbean Sea, from the Isthmus of Darien nearly to the mouth of the Amazon. The pure Caribs, mostly found about the Orinoco and in the forests of Guiana, have preserved the traditional warlike, savage, but intelligent features of the race. The native name is *Carina*, *Callinago*, or *Calina*, from which the term cannibal was derived; and most accounts describe the South American Caribs as still man-eaters. A mixed Carib tribe is found in Guatemala, and a few half-breeds also survive along the Mosquito coast, whither their ancestors were deported by the English from St Vincent in 1738. There is a reservation of land for a few Caribs in the island of Dominica. See Oher's *Camps in the Caribbees* (1880); Paton's *Down the Islands* (1888); Treve's *The Cradle of the Deep* (1908); W. Curtis Farabee's, *The Central Caribs* (Philadelphia, 1924).

Carica. See PAPAWE.

Caricature is a branch of satire, and the word is equally used to express either a pictorial or a descriptive representation, in which, while a general likeness is retained, peculiarities are exaggerated so as to make the person or thing ridiculous. Although sometimes applied to literary descriptions, the word caricature, when used alone, is generally understood to relate to design. Caricature being a natural expression of natural feelings, must be as old as man himself, and possibly the eccentric markings found on rocks and in caves are not entirely due to bad drawing, but were intended in certain cases to ridicule the artist's enemies. Examples of caricature have been found in the art of the Egyptians, the Greeks, and the Romans. Fortunately some Egyptian examples have been preserved, showing that the most ancient masters of the art did not spare even the sacred person of the king. One papyrus (the Satirical Papyrus of Turin), published as the last plate in Lepsius' *Auswahl*, contains rough sketches caricaturing the concerts depicted on the walls of the palace, also the battles, and particularly a scene on the walls of Ramses' pavilion, where the king is depicted playing chess with a girl of the harem. The king is drawn as a lion, the girl as a gazelle, and the whole has an undeniable humour in it that defies the touch of time. The popular pictures of the 'Dance of Death' in the middle ages may be looked upon in the light of caricatures. Although so considerable an antiquity may be claimed for the art, the name itself is quite modern, and being introduced from the Italian, it continued its foreign form for many years. The meaning is an overloaded representation, and the word is formed from the verb *caricare*, 'to load.'

One of the first writers to use the word *caricatura* was Sir Thomas Browne (1605-82), in his posthumous work on *Christian Morals*; and in the *Spectator* (1712) the Italian form is still retained: 'Those burlesque pictures which the Italians called *caricaturas*, where the art consists in preserving, amidst distorted proportions and aggravated features, some distinguishing likeness of the person, but in such a manner as to transform the most agreeable beauty into the most odious monster.' The word is not in Johnson's *Dictionary* (1755), but in 1788 Francis Grose wrote *Rules for Drawing Caricatures*, a work which was translated into French. Pictorial satires on the clergy were not uncommon in the middle ages, and in the reigns of Henry

VIII. and Elizabeth the pope was frequently satirised. During the Civil Wars, the satirists to some extent thrived in England. The reign of William III. again was a period of political satire, when Romeyn de Hooghe was the chief artistic champion of the king of England.

Modern caricature, however, may be said practically to commence with Hogarth (1697-1764), who lashed social vices instead of confining himself to the portrayal of political disagreements. Hogarth was succeeded by a host of talented artists, whose productions became the rage. Of these the most prominent were John Collet (1725-80), Henry William Bunbury (1750-1811), Thomas Rowlandson (1756-1827), George Moutard Woodward, John Heinrich Rambert (1763-1840), James Gillray (1757-1815), styled 'the prince of caricaturists', Denis Dighton (1792-1827), and James Sayer, commonly called Pitt's caricaturist. Of these Gillray and Rowlandson stand out as the chief. Bunbury's works were engraved by Rowlandson, who gave them much of his own style. The history of the time (grossly exaggerated, it is true) is to be found written in the works of these caricaturists. To these engravings we must go to understand the manners of the time, as well as to see what was the contemporary public opinion of Bute and Wilkes, of Pitt and Fox, and the political leaders of the Georgian era. George IV. was the object of satirical prints to an extraordinary degree. So great was the popularity of these caricatures, that shops were opened for their exclusive sale, and particular publishers devoted themselves to this business alone. Mention should also be made of John Kay, whose portraits illustrate so remarkably the history of Edinburgh life at the end of the 18th and beginning of the 19th century.

To eyes educated by the refined satire of the present day, the works of Gillray and Rowlandson and their followers appear singularly coarse. These caricatures are vigorous, but they are frequently disgusting to our taste. With the early part of the 19th century a complete change in the character of caricature took place, and for this ascendancy of good feeling we are largely indebted to the two Doyles, John and Richard, father and son.

John Doyle commenced his political sketches in 1829, and they became famous as the caricatures of H.B. It is scarcely possible to imagine two styles of art more distinct than those exhibited respectively in the caricatures of Gillray and Doyle. H.B.'s sketches are sometimes styled weak, but they exhibit a vivid picture of the party politics of the period over which the series extend. The Duke of Wellington, Sir Robert Peel, and the other leaders of the time stand out before us now as they appeared to their contemporaries. In the works of the older caricaturists likenesses were to some extent retained, but the persons caricatured were usually depicted as monsters rather than as human beings. In the caricatures of H.B. the resemblance was perfect, and it was the position rather than the person that was distorted. There was plenty of satire, but it was of a refined character. When H.B.'s sketches were discontinued, the weekly periodical *Punch* was started (1841), and Richard Doyle designed the well-known cover. In its pages may be seen the finest examples of delicate caricature by Leech, Keene, Tenniel, Du Maurier and other artists of repute, that have been produced. It may be remarked that our modern Hogarth, George Cruikshank, lived through the periods distinguished by the two styles of caricature. His earliest satires are in the manner of Rowlandson, while his later ones are in the more refined style of the present day. A return to the more robust style of the older caricaturists was made by Pellegrini ('Ape'),

Leslie Ward ('Spy'), and others in *Vanity Fair*, where the portraits of celebrated men were drawn in an exaggerated manner, so as to produce a ludicrous effect without essentially destroying the likeness. Other well-known names are those of Linley Sambourne, Harry Furniss, Phil May, E. T. Reed, Sir F. Carruthers Gould, Max Beerholm, and E. X. Kapp. The American counterpart to *Punch* is the vigorous and clever *Puck*. Equally well known are the *Fliegende Blätter* and *Simplicissimus* of Munich, and the less artistic *Kladderadatsch* of Berlin. Eminent in America have been Thomas Nast and J. F. Keppler, both of German birth; and in Holland, Louis Raemaekers.

Caricature in France may be said to date from about 1830, from the foundation by Philipon of *La Caricature*, and the greatest names are still those of Daumier, Gavarni, Grandville, and Monnier. Daumier combined in a remarkable degree the sense of form with that genius for happy exaggeration which is characteristic of the highest types of caricature. Monnier has secured his own immortality in that of his creation, Joseph Prudhomme. Grandville is, by universal consent, superb in portraiture. Other names are those of Decamps, Travès, Charlet, Raffet, Isabey, Giraud, Carle Vernet, Cham, Grévin, and 'Caïan d'Aché' (Emmanuel Poité).

A *History of Caricature and Grotesque in Literature and Art* was published by Thomas Wright in 1865, but the most important work on the subject is the *Catalogue of Satirical Prints and Drawings in the British Museum* (with Hawkins's valuable memoranda). Parton's *Caricature and other Comic Arts* (New York, 1877) deserves mention. Everitt published in 1886 *English Caricaturists of the 19th Century*. Joseph Grego has published two copiously illustrated works on caricatures, one devoted to the productions of Gillray, and the other to those of Rowlandson. See also Auguste Filon's *La Caricature en Angleterre* (1902); and on caricature in France, Dayot's *Maîtres de la Caricature Française au XIX^e Siècle* (1888); Grand Carteret's *Les Mœurs et la Caricature* (1886-88); Champfleury's *Histoire Générale de la Caricature* (5 vols. 1865-80; supp. 1885); George Paston's *Social Caricature in the Eighteenth Century* (1906).

Caricature Plant (*Graptophyllum hortense*), a plant of Ceylon, of the family Acanthaceæ, cultivated for its fantastically variegated leaves. Other species of the genus are found in Australia and Polynesia.

Caries ('rottenness') is a disease of bone analogous to the ulceration of soft tissues. It is characterised by a gradual loss of substance, from the particles of bone being absorbed, or being cast off and washed away in a purulent discharge. It is usually a form of tuberculosis, especially when it occurs in children, and is generally due to the 'bovine' type of the tubercle bacillus. On examination, the bone-cells are found filled with a reddish glairy fluid and deposits of tubercle. After caries has existed for some time, an abscess forms, and bursts; its aperture remains open, discharging a thin fluid, which contains particles of the bone. If a probe be passed through this opening, it will be felt to sink into some soft gritty substance; this is the carious bone, which, if removed and well washed, will be found to resemble in whiteness and fragility loaf-sugar softening in hot water.

Caries may attack any bone, but it usually selects the skull and face, the vertebrae, the bones of the hand or foot, and the soft ends of long bones forming joints, especially in the lower limbs. To this disease most deformities not congenital are owing. The carious vertebrae yield under the weight of the trunk, and the spine curves forwards, or to one side. In the joint-ends of bones the part enlarges, the cartilages become affected, matter forms, and amputation of the limb, or excision of the joint, is frequently necessary to save the

patient's life. Too often the disease recurs with night-sweats, hectic symptoms, and death.

If it affect a small bone, that bone may be entirely removed; and if the disease is strictly limited to the ends of bones forming a joint, these may be excised. Since 1860 great advances have been made in this department of surgery, and caries of the joints is comparatively seldom counted a sufficient reason for amputation; the knee, hip, shoulder, elbow, ankle, and wrist joints have all been repeatedly excised successfully.

Various forms of splint—e.g. Thomas's splints—have been introduced, which serve to keep the affected joint at rest, while permitting the patient to get a maximum of exercise for the remainder of the body in the fresh air. The tissues are thus placed in the best possible condition for overcoming the disease.

Judicious change of air, especially to a warm sea-side place, and the administration of tonics, cod-liver oil, &c., are also of great importance. Under such treatment, with careful attention to free exit of the discharge and cleanliness of the wound, recovery often takes place without operation; but when the natural processes are not able to effect this in those parts where the diseased bone can be reached, it should be gouged or scaped away, so as to leave a healthy surface of bone, which may granulate up, and heal. See BONE. Caries of the teeth is dealt with at TEETH.

Carigna'no, a town of Piedmont, on the Po, 11 miles S. of Turin, with some fine churches, and manufactures of silk-twist. It gives the title of prince to the reigning branch of the House of Savoy. Pop. 5000.

Carillon. See BELL.

Carima'ta, a name applied to the strait between Borneo and Biliton; also to a cluster of a hundred islets and reefs (area, 57 sq. m.; pop. 500) in that strait; and lastly, to the principal member of the group, whose highest point reaches 2600 feet.

Carinaria, a genus of free-swimming marine snails (Gasteropods) belonging to the small order Heteropoda. They are beautiful transparent animals, with a thin brittle shell (like a miniature paper nautilus) covering only the visceral hump and leaving even the gills exposed, and with the ventral surface or 'foot' pulled out into a movable tail, and bearing anteriorly a leaf-like swimming fin, provided with a sucker. The head protrudes far in front of the soft body, and bears a pair of tentacles. The organs and their working can be beautifully seen within the transparent body. The sexes are separate. *Carinaria* is represented by eight species in warmer seas. They swim back downwards, and feed voraciously on other marine animals, such as jelly-fish and pteropods. The common Mediterranean species, *C. mediterranea*, may be over six inches in length, has a violet proboscis and a rose-coloured foot, and is a beautiful transparent snail. The neighbouring genus *Pterotrachea* has no shell.

Carinate Birds, the technical name for the ordinary flying birds, in which the muscles working the wings are partly inserted on a prominent keel (Lat. *carina*) on the breast-bone. See BIRD.

Carini, a town of Sicily, 12 miles W. by N. of Palermo. It has an old castle, and a population of 13,000, chiefly engaged in fishing.

Carinthia (Ger. *Kärnten*), an Austrian land, forming part of the old kingdom of Illyria, with an area reduced in 1919 from 4000 to 3500 sq. m., and a population of 366,500; capital, Klagenfurt. The principal river is the Drave, which passes through the country from west to east in a course of 100 miles.

The general aspect of the country is mountainous, with long deep valleys, that of the Drave widening at Villach and Klagenfurt into a great plain, and dividing the *Noric* from the *Carinthian Alps*. The loftiest point is the Grossglockner (12,450 feet). There is very little tillage, owing to the mountainous character of the country, great part of which is covered with pasture or brushwood. Many houses and cattle are reared and exported. The principal products are lead and other metals. The manufactures include metal goods, leather, paper, cement, woollens, silk stuffs, and cottons. Carinthia, which derives its name from the Celtic *Carni*, belonged before the time of Augustus to Noricum, afterwards to the Roman empire. By-and-by the Carni were swept away in the deluge of immigration from the east, and Slavs settled in the country. In 1335 it came into the possession of Austria (q.v.). Before the cession in 1919 of a south-west corner to Italy, and a south-east to Yugoslavia, the population was 76 per cent. German, 21 per cent. Slovenian. Klagenfurt area decided by plebiscite (1920) to remain Austrian.

Carisbrooke, a village in the Isle of Wight, 1 mile SW. of Newport. In its ruined castle Charles I. was imprisoned (1647-48), as were also his children Prince Henry and the Princess Elizabeth, the latter of whom died here. From the castle well, 200 feet deep, the water is drawn by a donkey inside a wheel. A Norman castle was built here by William Fitzosborne; it was besieged by King Stephen; the outworks date from the time of the Armada panic. Carisbrooke was a Roman station, and a Roman villa was discovered here in 1859.

Carissa, a genus of Apocynaceæ. *C. Carandas* is a thorny shrub, much used for fences in India, and the fruit for tarts and preserves. Some species are as bitter as gentian, notably *C. xylopicron*, the *Bois amère* of Mauritius.

Carissimi, GIACOMO, composer, born in 1604 at Marino, near Rome, was organist from 1623 in Rome, and died there in 1674. His greatest service was the development of the sacred cantata. The finest of his oratorios, including *Jephta*, have been edited by Chrysander in *Denkmäler der Tonkunst* (vol. ii. 1882).

Carità (Ital.), in Art, the technical name for a representation of Maternal Love.

Carlaverock. See CAERLAVEROCK.

Carlén, EMILIE, a Swedish novel-writer, was born 8th August 1807 at Strömstad, near the Christiania Fjord. It was not till 1838 that her first novel, *Waldemar Klein*, was given to the world. She was then a widow; and in 1841 she married her second husband, J. G. Carlén, a lawyer and poet, in Stockholm. Her fictions, chiefly founded on the characteristics of the lower and middle classes, though faulty in many respects, are rich and striking in incident. Her novels were collected in 31 vols. (Stockholm, 1869-75), and many of these have been translated into English. She died at Stockholm on the 5th February 1892. See her *Reminiscences of Swedish Literary Life*.

Carleton, GUY. See DORCHESTER (LORD).

Carleton, WILL, American author, was born in Hudson, Michigan, 21st October 1845. He graduated at Hillsdale College in that state; and soon after completing his studenthood, he began to lecture in various parts of the United States and Canada. His best-known works are ballads of domestic life. His fresh and striking *Farm Ballads* (1873), *Farm Legends* (1875), *Farm Festivals* (1881), *City Ballads* (1885), *City Festivals* (1892), and *Rhymes of our Planet* (1895) attained a wide-popularity on both sides of the Atlantic. He died 15th January 1913.

Carleton, WILLIAM, Irish novelist, was born in 1794 at Prillisk, in County Tyrone. Of peasant birth, the youngest of fourteen children, he received some scanty instruction in a hedge-school; and falling in with a copy of *Gil Blas* about the same time that he gave up all thoughts of the priesthood, he came up to Dublin with only three shillings in his pocket. He thought first of turning bird-stuffer, of enlisting, then took to tuition, and finally to literature, contributing to the *Christian Examiner* a series of sketches, which in 1830 he republished under the title of *Traits and Stories of the Irish Peasantry*. Their freshness of style pleased the public; a second series (1833) was no less well received; and in 1839 appeared the powerful story, *Fardorougha the Miser*, in several passages of which, however, his humour becomes extravagant. He next published a series of tales (3 vols. 1841), mostly of pathetic interest, but including a very genial and humorous sketch of the *Misfortunes of Barney Branagan*, which proved a great favourite. *Valentine M'Clutchy* (1845) is half-political and half-religious in its tendency, defending the Irish Catholic priesthood, and advocating repeal of the Union. *Rody the Rover* (1846), *The Black Prophet* (1847), and *The Tithe Proctor* (1849) are also worthy of mention. Carleton's admirers have hailed him, not without contradiction, as the true historian of the Irish people. He was shiftless, improvident, affectionate to a fault. Lately he had a pension of £200. He died at Dublin, 30th January 1869. See the *Life* (containing part of his autobiography) by O'Donoghue (1896).

Carleton Place, a town and port of entry in Lanark County, Ontario, Canada, 28 miles SW of Ottawa. It stands on the Canadian Mississippi River. Its station is the junction for the Brockville branch of the Canadian Pacific Railway. Water-power is abundant, and there are railway and other machine-shops, foundries, large sawmills, woollen-mills, and other works. Pop. 3800.

Carli, GIOVANNI RINALDO (1720-95), professor of Astronomy at Venice, wrote on numismatics, on Iastian and other antiquities, and on classical subjects, and against Rousseau.

Carlile, RICHARD, a much-prosecuted Radical, was born at Ashburton, in Devonshire, 8th December 1790. After some education at the village free school, where Gifford had been a scholar, he served in a chemist's shop, and afterwards as apprentice to a tinner, whose undue severity kept alive the rebellious spirit of the boy. Paine's *Rights of Man* converted him into a Radical propagandist, and in 1817 he began to vend a London weekly, *Black Dwarf*, next sold thousands of Southey's *Wat Tyler*, reprinted Hone's *Parodies*, and wrote a series of imitations of these, for which he was rewarded with eighteen weeks in the King's Bench. For reprinting Paine's works and some similar books, he was sentenced, after a three days' trial, in November 1819 to a fine of £1500 and three years' imprisonment in Dorchester gaol. Here he at once began to issue his periodical, *The Republican*, of which the first 12 vols. are dated from his prison. His wife, for continuing to publish, was sentenced in 1821 to two years' imprisonment. But the indomitable Radical continued still to publish spite of a public subscription, for the prosecution of his assistants, of £6000, headed by the Duke of Wellington; of repeated seizures of his stock; of a three years' extension of his own confinement in lieu of the fines; the imprisonment of his sister for a year besides a fine of £500; and the imprisonment of nine of his shopmen in terms of from six months to three years. After his release Carlile continued his activity, editing *The Gorgon*, and holding free discussions in the London Rotunda.

Three more years' imprisonment he suffered for refusing to give sureties for his good behaviour after a prosecution that grew out of his refusal to pay church-rates; and a second period of ten weeks, in 1834-35, for resisting the same payment, brought up the total of the imprisonment of this much-enduring man to nine years and four months. He died 10th February 1843. This martyr at least was as ready to suffer as to bluster, and may safely be said to have done as much as any Englishman for the freedom of the press. See Holyoake's *Life and Character of R. Carlile* (1848).

Carlina Thistle (*Carlina*), a beautiful genus of Compositæ, closely allied to the true thistles, from which they are distinguished by the inner spreading bracts of the involucre, which, coloured and shining, are remarkably hygrometric, expanding in dry and closing together in wet weather, and this property they retain for a long time; the heads of flowers are therefore often nailed on cottage-doors in many parts of Europe to indicate the weather. The name is said to be derived from a legend that an angel showed the root of one of the species, *C. acaulis*, to Charlemagne as a remedy for a plague in his army. Linnæus, however, tells the story,

Carlina Thistle (*Carlina acaulis*).

without the angel, of the army of Charles V., while the most sceptical regard the name as merely a corrupt diminutive of Ital. *cardo* (dim. *cardina*), 'a thistle.' The root is certainly a drastic purgative, and hence was formerly held in high medical repute; now, however, it is quite disused, save in veterinary practice. The only British species is *C. vulgaris*.

Carlisle, a parliamentary and municipal borough, the county town of Cumberland, stands on a gentle eminence in a wide-spreading plain, at the influx of the Caldew and Petteril to the Eden—three streams that nearly encircle it. An important railway centre, it is 299 miles NNW. of London, 101 miles S. of Edinburgh, 22½ E. by N. of its seaport, Silloth, and 66 W. by S. of Newcastle. In spite of its hoar antiquity, 'merry' Carlisle as a whole is disappointingly modern, its gates having vanished, and almost the whole of the walls. The castle was founded in 1092, and now serves as a barracks. The remains of its Norman keep form a massive tower; but that portion of the fortress in which Mary Queen of Scots was for two months imprisoned (1568) was demolished in 1835. The cathedral, founded by William Rufus, and dedicated in 1101 by Henry I., in 1133 was made the cathedral church of the newly-formed diocese. It has four times suffered by fire, the greatest in 1292; and ranging in date between 1092 and 1419, it comprises

every variety of style from Norman to Perpendicular. The fragment of the Norman nave was long used as a parish church. The choir, mainly Decorated in style, is 137 feet long, 71 broad, and 75 high. It is one of the finest choirs in England, the exquisite tracery of its nine-light east window being of matchless beauty. The central tower, only 127 feet high, formerly supported a timber spire, which was removed in the 18th century. There are monuments and other memorials to Paley, Dean Close, and Archbishop Tait's five children; and in the nave (then St Mary's Church) Scott married Miss Carpenter or Charpentier (1797). The building was restored in 1853-57. The court-house and county gaol are the most noticeable of the public buildings; the Eden is crossed by a handsome five-arch bridge (1851); and in the town are statues of the second Earl of Lonsdale and of James Steel, editor of the *Carlisle Journal*. The chief branches of industry are cotton, calico, bat, and iron manufactures; fancy biscuits are largely made; and the Eden has salmon-fisheries. The parliamentary representation was reduced to one member in 1885. Pop. (1801) 10,221; (1851) 26,310; (1921) 52,600. The *Lugwallum* of the Romans, and *Cæst-luel* (hence *Carlisle*) of the Britons, the town was destroyed by the Danes in 875, and restored by William Rufus in 1092. From its position as a Border fortress, it has a wealth of martial memories—none more famous than the rescue of 'Kinmont Willie' by Buccleuch from Carlisle Castle in 1596. During the Great Rebellion it twice surrendered to the Parliamentarians (1645-48); and in the '45 it was held for a time by the Jacobites, thirty-one of whom were afterwards executed on Harray Hill. The Carlisle Tables of Mortality, based on the deaths here in 1779-87, are much used in Insurance (q.v.).

See Freeman's *English Towns* (1883); Bishop Creighton's *Carlisle* ('Historic Towns,' 1889); R. S. Ferguson's *Carlisle* ('Diocesan Histories,' 1890).

Carlisle, capital of Cumberland county, Pennsylvania, 19 miles WSW. of Harrisburg by rail, is the centre of a rich agricultural country. It is the seat of Dickinson College (Methodist), a government school for Indian children, and has barracks, machine-shops, a foundry, and manufactures of railway cars, carriages, carpets, windows, and shoes. It was shelled by the Confederates in 1863. Pop. 11,000.

Carlisle, GEORGE WILLIAM FREDERICK HOWARD, seventh EARL OF, K.G., was born in London, April 18, 1802. Educated at Eton and Christ Church, Oxford, he took in 1821 the Chancellor's and Newdigate prizes, and graduated with a first-class in classics. In 1826 he was returned for the family borough of Morpeth, and at once attached himself to Earl Grey and the cause of parliamentary reform. In 1830 he, along with Henry Brougham, was elected for Yorkshire, and after the Reform Bill he was returned for the West Riding, a seat which he lost in 1841, but recovered in 1846. Under Lord Melbourne, he was Chief-secretary for Ireland (1835-41), and, under Lord John Russell (1846-52), Chief-commissioner of Woods and Forests, and afterwards Chancellor of the Duchy of Lancaster. In 1848 he succeeded to the peerage. Palmerston appointed him Lord-lieutenant of Ireland in 1855, and again, on the downfall of Derby's government, in 1859. Carlisle obtained some literary reputation by his lectures on his travels in the United States, and on the life and writings of Pope, his *Diary in Turkish and Greek Waters*, and a volume of posthumous *Poems*. He died at Castle Howard, December 5, 1864.

Carlists, the name given to the supporters of the Spanish pretender, Don Maria Isidor Carlos de Bourbon, who was born March 29, 1788, the second

son of Charles IV. of Spain, and was educated chiefly by priests. After the expulsion of the French from Spain, and the re-accession of his brother, Ferdinand VII., who had had no children from three marriages, Don Carlos naturally began to cherish the hope of succeeding to the throne. A fourth time, however, the indefatigable Ferdinand married, and the result was a daughter, the Infanta Maria Isabella (queen of Spain till her deposition in 1868), born October 10, 1830. Now as the Salic Law excluding females from succession to the throne, introduced into Spain by Philip V. in 1713, had been abrogated after much hesitation by Ferdinand at the instigation of his new wife, Christina, in a formal 'Pragmatic Sanction,' four months after their marriage, the birth of this daughter completely destroyed the hopes of the Carlists. As Don Carlos still continued his agitation, he was banished in 1833 to Portugal, and soon afterwards was commanded to reside in the Papal States. But before he had embarked for Italy, King Ferdinand VII. died, September 29, 1833. The child Isabella was at once proclaimed queen with her mother Christina as regent; she was supported mainly by the liberals in the state, while Don Carlos rallied round him chiefly the supporters of absolutism. His chief strength lay in the indomitable courage of the inhabitants of the Basque provinces, whose ancient *fueros* the Liberals had foolishly refused to confirm, and here the struggle raged hotly for some years. Under Zumalacarreui and Cabrera the Carlists had at first considerable success, but were at length subdued by Espartero in 1839. Meanwhile the claim of Don Carlos had been recognised not only by the Carlists, but also by Dom Miguel in Portugal; the latter, however, was banished by the quadruple alliance of Spain, Portugal, England, and France. In June 1834 Don Carlos embarked for England, but in the following month he returned to the Continent, and passed in disguise through France into the northern provinces of Spain, whence he was ultimately compelled to escape into France. In 1836 his claims to the throne were unanimously rejected by the Constituent Cortes; in 1844 he abdicated in favour of his eldest son. He died at Trieste, March 10, 1855.—DON CARLOS, his son, born 1818, was better known as the Count de Montemolin. This second pretender made an attempt in 1849 to pass under a disguise through France into Spain, but failed. In 1860 an attempt was made at Tolosa in Valencia to stir up another Carlist insurrection, in consequence of which the Count de Montemolin and his brother Ferdinand were arrested, but liberated after they had signed a renunciation of all their claims to the Spanish throne. He died in 1861.—The next representative of the Carlist pretensions, his brother, DON JUAN (1822-87), in 1868 renounced his claim in favour of his son, DON CARLOS the third (1848-1909), on whose behalf Carlist risings—speedily repressed—took place in 1869, 1870, and 1872; but the insurrection headed by him in person after the abdication of King Amadeo in 1873 proved much more formidable, and kept the Basque provinces in great confusion till the beginning of 1876, when it was finally crushed, and the last of their ancient privileges stripped from the Basques, who showed heroic courage in a lost cause. Don Carlos crossed into France, was expelled in 1881 for expressing sympathy with the Legitimists (some of whom regarded him as the true heir to the throne of France also), and made his home in Venice. His pretensions were inherited by his son DON JAIME (born 1870), an officer in the Russian service. In his time the Carlists split. Don Jaime was disavowed by the leader, Vasquez de Melle, but continued to be the head of the movement, which

had lost all practical significance. See books on modern Spain by Martin Hume (1899) and Butler Clarke (1907).

Carlo Dolci. See **DOLCI**.

Carlos, DON. See **CARLISTS**.

Carlos, DON, son of Philip II. by his first marriage with Maria of Portugal, was born at Valladolid, July 1545. After his recognition as heir to the throne, Don Carlos was sent to study at the university of Alcalá de Henares; where, however, he profited so little, that the king, regarding him as unqualified to reign, invited a nephew, the Archduke Rudolf, to Spain, intending to make him heir to the throne. The weak intellect, with vicious and cruel tendencies, which the young prince showed early, may have been due to an injury to his head from a fall down the stairs at Alcalá de Henares; or more probably was congenital through the fatal descent from 'Juana la loca,' and only aggravated by his accident. Excluded from all participation in the government, he early conceived a strong aversion towards the king's confidants, and especially was unwilling that the Duke of Alba should have the government of Flanders. In confession to a priest, on Christmas eve 1567, he betrayed his purpose to assassinate a certain person; and as the king was believed to be the intended victim, this confession was divulged. The papers of Don Carlos were seized; he was tried and found guilty of conspiring against the life of the king, and of traitorously endeavouring to raise an insurrection in Flanders. The sentence was left for the king to pronounce. Philip declared that he could make no exception in favour of such an unworthy son; but sentence of death was not formally recorded. Shortly afterwards he died, July 24, 1568, and was interred in the Dominican monastery, El-Real, at Madrid. The suspicion that he was poisoned or strangled has no valid evidence to support it, and natural causes, as constant fever, a depraved appetite, and an injury to the brain, are of themselves enough to account for his death. The enemies of Philip II. were eager to prove him the murderer of his son, and much has been written on this problem. The version of the story which obtained so much currency through *Don Carlos*, the great tragedy of Schiller, was due to the romancing pen of Saint-Réal in 1672. Its credibility was shattered first in 1817 by the Spanish writer, Llorente, and in 1829 by the learned Ranke in vol. xlv. of the *Wiener Jahrbuch der Literatur*. The most important contribution to the question since is Gachard's *Don Carlos et Philippe II.* (2d ed. Paris, 1867). A new and not unfavourable light on Philip's character as a father has been thrown by the publication of *Lettres de Philippe II. à ses filles* (Paris, 1884) by the same editor. See also Maurenbrecher, *Don Carlos* (2d ed. Berlin, 1876), and Stirling-Maxwell, *Don John of Austria* (1883).

Carlovingians, or KARLINGS, the second dynasty of Frankish kings. The family came from the eastern part of the Frankish kingdoms, and its origin is traced to Arnulph, Bishop of Metz, at the beginning of the 7th century. Pepin, a grandson of the bishop, became Mayor of the Palace to the Frankish kings of the Merovingian line. Pepin's natural son, the famous Charles Martel, and Charles's son Pepin, followed in the same office. They were the real rulers of the Frankish monarchy, till in 752 Pepin dethroned the last of the *faimeant* Merovingian sovereigns and placed himself on the throne. Incomparably the greatest of the line was Charles the Great (Charlemagne), from whom it was named, and who in 800 was proclaimed Emperor of the West. Charles's son, Louis (814-840), was a weak ruler, after whose death the great Frankish empire erected by Charlemagne was divided in 843 between

his three sons, Lothar, Louis, and Charles. United in 884 under Charles the Fat, the empire was finally broken up in 887 into divisions roughly corresponding to the modern France and Germany with Lorraine and Burgundy between them. Members of the Carlovingian house, however, continued to rule in Germany till 911, and in France till 987, when they were superseded by the House of Capet. The Carlovingian kings had for some time previous possessed no real power. A subsequent marriage, however, connected their family with that of the Capets, and enabled the kings of France to trace their descent from Charlemagne.

The Carlovingian dynasty figures in the early history of France as the ally of the church. It aided the popes against the Lombards; made war on the Aquitanians, who pillaged and despoiled the churches; established the temporal power of the successors of St Peter; subdued and converted the still pagan Saxons; and fought the Mohammedans in Spain. Nor, on the other hand, do we find the church ungrateful: it sanctioned, by benediction and prayer, the conquests of this powerful family; in various ways impressed its sacred stamp of approbation upon it; and for its sake resuscitated the imposing idea of an empire of the West. But this alliance which was advantageous to the policy of kings like Pepin and his son Charlemagne, because they had genius, vigour, and design, became at a later period, under their feeble successors, a chief cause of the overthrow of the dynasty, for the clergy after 814 grew stronger and more exacting every day, and forced the monarchs to new concessions.

The word Carlovingians is formed on a false analogy from Merovingians (q.v.) or Merwings; it should be *Carolings* or *Karlings*, and means descendants of Karl the Great, or Charlemagne.

Carlo'vitz, or KARLO'WITZ (in England, however, usually *Car'lovitz*; Croat. *Karlovec*), a town of the Yugoslav state, in Slavonia, on the right bank of the Danube, 30 miles NW. of Belgrade. It has a Greek cathedral, and is noted for its wine, which—especially the red variety—ranks with the best and strongest, and is largely exported. Pop. 5500. The treaty of Carlo'vitz was concluded, in 1699, between the allies Austria, Russia, Poland, and Venice, on one side, and the Porte on the other, and provided that Austria should repossess the territories captured by the Turks during two centuries, including Hungary, Slavonia, &c.; that Venice should hold the Morea; that Poland should take back Podolia and part of the Ukraine; and that Russia should have the territory of Azov.

Carlow, a small inland county of Ireland, in the province of Leinster, with an area of 346 sq. m. Except on the south-east border, where Mount Leinster rises to 2610 feet, Carlow is a triangular fertile level, or gently undulating plain, between the Wicklow and Wexford range of hills on the east, and the highlands beyond the Barrow on the west. The chief rivers are the Barrow and Slaney. The predominant rock is granite, covered in the middle plain, or richer tracts, by limestone gravel, on which are fine loams and pasture. In the uplands the soil is gravelly. Lower Carboniferous Limestone crops out in the valley of the Barrow. On the west side of the county begins the great coal district of Leinster. Barely one-third of the entire area is under oats, wheat, potatoes, and other crops. There are many dairies on the plains. Along the Barrow, which falls more than a foot per mile, are many large corn-mills. Pop. (1841) 86,228; (1881) 46,568; (1911) 36,252, of whom 89 per cent. are Catholics. Along with Kilkenny the county returns four members to the Free State

parliament. It sent one member to Westminster till 1922. The chief towns are Carlow, Bagenalstown, and Tullow. Several engagements occurred in the county during the Irish rebellion of 1798. The chief antiquities of Carlow are cromlechs, castles, and the cathedral church of Old Leighlin. A cromlech near Carlow town has a covering stone 23 feet long, and of nearly 90 tons weight.

CARLOW, the county town, stands at the influx of the Burren to the Barrow, 56 miles SW of Dublin by rail. It has a Catholic cathedral and divinity college, the county court-house, extensive flour-mills, and is the emporium for the agricultural produce of the district. Pop. (1851) 9121; (1911) 6619. Till 1885 it returned a member to parliament. There are remains of a castle, picturesquely situated on an eminence on the Barrow, founded in 1180 by Sir Hugh de Lacy. In 1361 the Duke of Clarence established the exchequer of the kingdom in this place. It constituted one of the boundaries of the Pale, beyond which the king's writ was not recognised by the 'Irishry.' The town grew up around this castle, which was dismantled after its capture by Ireton in 1650. In 1798 the rebels attacked the town, but were repulsed by the garrison and yeomanry, and 600 of them killed. The Barrow is here navigable for small craft to its junction with the Grand Canal at Athy.

Carlsbad (Czech *Karlovy Vary*), a town in Bohemia, on the Tepl, near its influx to the Eger, 116 miles W. by N. of Prague by rail. It is widely celebrated for its hot mineral springs, and frequented in summer by visitors of the most aristocratic character from all parts of Europe. The permanent inhabitants (20,000) are very industrious, making jewellery, porcelain, and various articles such as are likely to find ready purchasers among the visitors, who in the season—April to October—number from 25,000 to 35,000. Set in most lovely scenery, the town is well built, and offers good accommodation for its guests. The temperature of the hot springs varies from 117° to 167° F. The principal spring, the Sprudel, has a very large volume, and is forced up to a height of 3 feet from the ground. Altogether, the daily flow of the springs of Carlsbad is estimated at 2,000,000 gallons. The principal ingredient in the water is sulphate of soda. The whole town of Carlsbad appears to stand on a vast caldron of boiling water, which is kept from bursting only by the safety-valves the springs provide. Carlsbad was made a free town by Joseph I. in 1707, the first Kruhaus was built in 1711. In 1812 the reactionary Carlsbad Decrees were issued against liberalism and the Burschenschaft (q.v.).

Carlsburg. See KARLSBURG.

Carlshamn, a fortified seaport on the south coast of Sweden, 30 miles W. of Carlskrona, and 339 miles SSW. of Stockholm by rail. Founded in 1664, it has manufactures of tobacco, brandy, &c., and a considerable trade. Pop. 7000.

Carlskrona, the capital of a Swedish province, is built on five rocky islets in the Baltic, 240 miles (by rail 350) SSW. of Stockholm. It was founded in 1680 by Charles XI., who gave it his own name, and made it the great naval station and arsenal of Sweden, instead of Stockholm. It has a magnificent harbour, with a sufficient depth of water to float the largest vessels. The only practicable entrance is strongly defended. Population, 27,500.—The coast province of Blekinge or Carlskrona has an area of 1164 sq. m., with a population of about 150,000.

Carlsruhe, or KARLSRUHE, the capital of the state of Baden, is situated 5 miles east of the Rhine, and 39 WNW. of Stuttgart, 34 SSW. of

Heidelberg. Founded in 1715, and built in the form of a fan, with thirty-two streets radiating from the palace, it has a number of fine buildings—the palace (1751–76), the parliament-house (1845), the theatre (1853), the town-hall (1821), the museum (1832), with the state library (Badische Landesbibliothek). Before the palace stands a bronze statue of the city's founder, the Margrave Charles William; and in the market-place is a stone pyramid enclosing his remains. The manufactures include machines of various sorts, engines, locomotives, railway carriages and wagons, jewellery, carpets, chemicals, and cloth. Pop. 140,000.

Carlstad, a town of Sweden, on the island of Tingvalla, close to the northern shore of Lake Wener, 205 miles WSW. of Stockholm. Connected with the mainland by two bridges—one of which is a handsome structure—and greatly improved since the fire of 1865, it is a well-built place, with a cathedral, and a considerable trade. Pop. 20,000.

Carlstadt (Croat. *Karlovac*; Magy. *Károlyváros*), a fortified town of Croatia, on the Kulpa, 32 miles SW. of Zagreb. It is the seat of a Greek bishopric, and has a large transit trade. Pop. 10,000.—**CARLSTADT**, in Bavaria, on the Main, is 15 miles NNW. of Würzburg; pop. 3000.

Carlstadt (properly, ANDREAS RUDOLF BODENSTEIN), reformer, born prior to 1483 at Carlstadt in Bavaria, joined Luther, who in 1521 was compelled to rebuke his iconoclastic zeal, and whom he afterwards opposed on the question of the Eucharist. Accused of participation in the Peasants' War (q.v.) and other intrigues, he fled to Switzerland, and became professor of Theology at Basel, where he died, 25th December 1541.

Carlton Club, the famous Conservative club (see CLUB), was so named as being near the site of Carlton House, built by Lord Carlton in 1709. Carlton House was the residence of Frederick, Prince of Wales (father of George III.), and of George IV. when Prince of Wales. It was pulled down in 1826.

Carlundovica. See CYCLANTHACEÆ.

Carlruke, a town of Lanarkshire, near the Clyde, 19 miles SE. of Glasgow. The neighbourhood is rich in coal, iron, and limestone. Mining, fruit-growing, and jam-making are its chief industries.

Carlyle, ALEXANDER, of Inveresk, was born 26th January 1722 in Dumfriesshire, but brought up at Prestonpans, where his father was appointed minister. Educated at Edinburgh, Glasgow, and Leyden, he was ordained in 1748 minister of Inveresk, and here he remained till his death, 25th August 1805. With Robertson, the historian, he helped to lead the moderate party in the Church of Scotland; and he enjoyed in succession the highest honours of his profession, being occasionally sent to London as the accredited agent of his church, appointed Moderator of the General Assembly in 1770, and Dean of the Chapel-royal in 1789. His imposing presence earned him the popular name of 'Jupiter Carlyle'; 'he was,' says Sir Walter Scott, 'the grandest demigod I ever saw.' Throughout his long lifetime he enjoyed the intimate friendship of some of the most notable men of his time, as Hume, Adam Smith, Smollett, John Home, and many others on both sides of the Tweed; while he had seen and even shared in events as striking as the Porteous Mob and the government rout at Prestonpans. Hence the unique interest of his *Autobiography*, which was not begun till he had reached his seventy-ninth year, and comes down only to 1770, when he was but forty-eight. It was not published till 1860, when it was edited, and completed with a supplementary

chapter by Hill Burton (new ed. with portraits, 1910). Keen observation, perfect sincerity, and a not unkindly sarcasm combine to give the book a charm of a quite singular character, and indeed there are few books that can be compared with it as an intimate picture of the social habits of a bygone age. Its author unconsciously reveals himself a man of singularly genial, sagacious, and liberal nature, none the less a sincere Christian that he had a sound relish for claret, whist, play-going, and all the honest good things of life.

Carlyle, THOMAS, was born 4th December 1795, at Ecclefechan, in the parish of Hoddam, Annandale, Dumfriesshire—a small Scottish market-town, the 'Entepfuhl' of *Sartor Resartus*, 6 miles inland from the Solway, and about 16 by road from Carlisle. He was the second son of James Carlyle, stonemason (1758–1832); but his first son by his second wife, Margaret Aitken (1771–1853). James Carlyle, who came of a family which, although in humble circumstances, was an offshoot of a Border clan, was a man of great physical and moral strength, of fearless independence, and of, in his son's opinion, 'a natural faculty' equal to that of Burns; and Margaret Aitken was 'a woman of the fairest descent, that of the pious, the just, and the wise. Frugal, abstemious, prudent, though not niggardly, James Carlyle was prosperous according to the times, the conditions of his trade, and the standard of Ecclefechan. He was able, therefore, to give such of his sons (he had a family of ten children in all, five sons and five daughters) as showed an aptitude for culture an excellent Scottish education. Thomas seems to have been taught his letters and elementary reading by his mother, and arithmetic by his father. His home-teaching was supplemented by attendance at the Ecclefechan school, where he was 'reported complete in English' at about seven, made satisfactory progress in arithmetic, and took to Latin with enthusiasm. Thence he proceeded in 1805 to Annan Academy, where he learned to read Latin and French fluently, 'some geometry, algebra, arithmetic thoroughly well, vague outlines of geography, Greek to the extent of the alphabet mainly.' His first two years at Annan Academy were among the most miserable in his life, from his being bullied by some of his fellow-pupils, whom he describes as 'coarse, unguided, tyrannous cubs.' But he 'revolted against them and gave them shake for shake.' In his third year, Carlyle had his first glimpse of Edward Irving, who was five years his senior, and had been a pupil at Annan Academy, but was then attending classes at Edinburgh University. In November 1809 Carlyle himself entered that university—travelling on foot all the way, a hundred miles, between Ecclefechan and the Scottish capital. Except in one department, Carlyle's college curriculum was not remarkable. In 'the classical field' he describes himself 'truly as nothing,' and learned to read Homer in the original with difficulty. He preferred Homer and Æschylus to all other classical authors, found Tacitus and Virgil 'really interesting,' Horace 'egotistical, leichtfertig,' and Cicero 'a windy person and a weariness.' Nor did he take much to metaphysics or moral philosophy. In geometry, however, he excelled, perhaps because Professor (subsequently Sir John) Leslie 'alone of my professors had some genius in his business, and awoke a certain enthusiasm in me.' But even in the mathematical class he took no prize.

In 1813 Carlyle's attendance at the Arts course in Edinburgh University came to an end, and he began formal though fitful preparation for the ministry of the Church of Scotland by enrolling

himself, on 16th November of the same year, as a student at its Divinity Hall. In the summer of 1814 he competed successfully at Dumfries for the mathematical mastership of Annan Academy. The post was worth only between £60 and £70 a year; but it enabled Carlyle, who was as frugal as his parents, to relieve his father of the expense of his support and to save a few pounds. Meanwhile he read widely, and wrote of his reading at great length, and with considerable power of satiric characterisation, to some of his college friends. But he found himself 'abundantly lonesome, uncomfortable, and out of place' in Annan, and from the first disliked teaching; while his 'sentiments on the clerical profession' were 'mostly of the unfavourable kind.'

In 1816 Carlyle accepted the post of assistant to the teacher of the parish (or grammar) school of Kirkcaldy, with 'an emolument rated about a hundred a year,' and all actual scholastic duties to perform. This change brought him into intimate relations with Edward Irving, who, having acquired a reputation as a teacher in Haddington, had been induced by the patrons of an adventure school in Kirkcaldy to undertake the management of it. The two, though professionally rivals, became fast friends, and read and made excursions into different parts of Scotland together. Carlyle was also introduced by Irving to various Kirkcaldy families, including that of Mr Martin, the parish minister, one of whose daughters his friend subsequently married. He himself became attached to an ex-pupil of Irving's, a Miss Margaret Gordon, with some of whose graces he afterwards endowed the dark and fickle Blumine of *Sartor Resartus*. She reciprocated Carlyle's affection, but the aunt with whom she lived put a stop to some talk of an engagement.

Carlyle found the people of Kirkcaldy more to his mind than those of Annan; but in two years the work of teaching became altogether intolerable to him, although he did it conscientiously. Successful opposition sprung up to Irving and himself, moreover, in the shape of a third school. Irving resolved to leave Kirkcaldy, and, in September 1818, Carlyle wrote to his father, who had now given up business in Ecclefechan and taken the farm of Mainhill, about two miles distant, that, having saved about £70, he purposed removing to Edinburgh, where he thought he 'could, perhaps, find private teaching to support him, till he could fall into some other way of doing.' He had now totally abandoned all thoughts of entering the ministry.

Carlyle removed to Edinburgh in November 1818. His prospects were for some time dubious; he even entertained the idea of emigrating to America. Ultimately, however, he obtained fairly regular and well-paid private teaching. An introduction to Dr (afterwards Sir David) Brewster, the editor of the *Edinburgh Encyclopedia*, led to his writing articles, chiefly biographical and geographical, for that work, at 'bread-and-butter wages,' and subsequently to his translating Legendre's *Elements of Geometry* from the French for £50. At the beginning of the session of 1819, he enrolled in the class of Scots Law, with the intention of becoming an advocate. But he found law as uncongenial a study as divinity. Till 1822 he lived in various lodgings in Edinburgh, finding his chief relief from tutorial drudgery in visits to his parents in Dumfriesshire. His health, which had suffered from too close application to study, was at times 'most miserable,' he 'was in a low fever for two weeks,' was harassed by sleeplessness, and began to be tortured by his life-long foe, dyspepsia. At the same time his mind was perplexed with doubt on religious matters, regarding which he seems to

have unburdened himself solely to Irving, who was then assistant to Dr Chalmers in Glasgow. For a period he was 'totally irreligious.' This struggle terminated in June 1821, 'all at once,' and when he was walking along Leith Walk (the Rue St Thomas de L'Enfer of *Sartor Resartus*), in what he regarded as his 'spiritual new birth.' He was now absorbed in German literature, especially the writings of Schiller and Goethe. The latter, indeed, had a more abiding influence on him than any other author.

In June 1821 also occurred his introduction, through Irving, to Miss Jane Baillie Welsh (1801-66), only daughter of Dr John Welsh, medical practitioner in Haddington, who had died two years before, leaving his daughter sole heiress of the small estate of Craigenputtock, 16 miles from the town of Dumfries. Miss Welsh, who was descended through her father from John Knox, was then living in Haddington with her mother, who claimed kindred with the patriot Wallace, and, according to Carlyle, 'narrowly missed being a woman of genius.' Miss Welsh had been the private pupil of Irving when he was a teacher in Haddington, and the result of the acquaintance thus brought about was a passionate attachment. They would, indeed, have been married, but for Irving's engagement to Miss Martin. The introduction of Carlyle to Miss Welsh, then twenty years of age, led to a correspondence between them on literary matters. After a time Carlyle attempted to adopt the tone of a lover. This, however, she preemptorily forbade, although she refused other suitors.

Early in 1822 Irving, who was on the point of entering on the pastorate of the Caledonian Chapel in Hatton Garden, London, recommended Carlyle as tutor to the three sons of Mr Buller, a retired Anglo-Indian. The salary offered was £200 a year. Carlyle, who had previously declined the editorship of a Dundee newspaper, accepted the offer; and two of the three, Charles Buller (q.v.) and Arthur, came to Edinburgh in the spring, to be under his care, while attending classes at the university. Carlyle found his duties pleasant, and was now able to give substantial pecuniary aid to his family, particularly as regarded the education of his younger brother John (1801-79), who subsequently became a physician, but is better known as the translator of Dante's *Inferno* (1849). Carlyle, after contemplating a history of the British Commonwealth, and a novel in association with Miss Welsh, arranged to write a *Life of Schiller* for Mr Taylor, the proprietor of the *London Magazine*, and a translation of the *Wilhelm Meister* of Goethe for Mr Boyd, an Edinburgh publisher. These two enterprises fully occupied his leisure while he was engaged as a tutor to the Bullers, whose parents, after spending the winter of 1822 in Edinburgh, removed in the following spring to Kinnaird House, near Dunkeld, on the Tay.

Carlyle paid his first visit to London in June 1824, whither the Bullers had gone, and, although his engagement with them was abruptly broken off, he remained there till March 1825, superintending the publication in book-form of his *Life of Schiller*. At this time he received the first of a series of letters from Goethe, and made the acquaintance of Coleridge, Thomas Campbell, Allan Cunningham, Procter, and other literary notabilities. On March 26, 1825, he removed to the farm of Hoddam Hill, about two miles from Mainhill, which he had leased, his brother Alexander doing the practical work of farming, while he himself translated German romances. Miss Welsh now consented to become his wife, after a lengthened correspondence. In 1826 he quarrelled with his landlord; his father gave up his farm; and both removed to Scotsbrig, another farm in the vicinity

of Ecclefechan. The marriage between Carlyle and Miss Welsh took place on 17th October 1826, at her grandfather's house at Templand, Dumfriesshire, and they at once settled in 21 Comely Bank, Edinburgh. Here Carlyle completed four volumes of translations from Tieck, Musæus, and Richter, which were published under the title of *German Romance*, and commenced a didactic novel, but burned his manuscript. An introduction from Procter to Jeffrey led to his becoming a contributor to the *Edinburgh Review*, his first article, on Jean Paul Richter, appearing in June 1827. The same year, he failed in his candidature for the chair of Moral Philosophy in the university of St Andrews in succession to Dr Chalmers. Various subsequent attempts to obtain an academic position for Carlyle met with no better success.

In May 1828 the Carlyles removed to Mrs Carlyle's little property of Craigenputtock, which, in a letter to Goethe he described as 'the loneliest nook in Britain, six miles removed from any one likely to visit me,' and there they lived for about six years. Carlyle subsisted during this period by writing for a number of Reviews, including the *Edinburgh*, the *Westminster*, the *Foreign Quarterly*, and *Fraser's Magazine*. The chief of the essays which he produced at Craigenputtock are those on Burns, Samuel Johnson, Goethe, Voltaire, Diderot, and Schiller. He also wrote a *History of German Literature*, the best parts of which were subsequently published in the form of essays; and in 1833-34 there appeared by instalments in *Fraser's Magazine*, *Sartor Resartus*, his most characteristic work, the fantastic hero of which, Diogenes Tinfelsdröckh, illustrates in his life and opinions the mystical and grotesque 'Philosophy of Clothes.' *Sartor Resartus* is notable in the literary history of Carlyle as revealing the Germanisation of his mind, and his abandonment of the comparatively simple diction of his earlier essays for the thoroughly individual style of his later works—eruptive, ejaculatory, but always powerful, and often rising to an epic sublimity. Life at Craigenputtock was varied on the part of Carlyle by occasional visits to Edinburgh, in one of which the idea of writing his *French Revolution* occurred to him, by a residence of six months in London, during which he made the acquaintance of John Stuart Mill and John Sterling, and by visits from old friends like Jeffrey and new admirers like Emerson. In 1830 Carlyle was reduced to great straits; and he had to borrow £50 from Jeffrey for the expenses of his journey to London, although he declined to accept an annuity of £100 from the same source.

Having by 1834 again saved £200, Carlyle resolved to try his fortune in London, and on June 10 established himself in the house, 5 Cheyne Row, Chelsea, in which he lived till the day of his death. Here he settled down to the writing of his *French Revolution*, which appeared in 1837. This enterprise was almost put an end to in 1835, owing to the destruction, by a servant girl, of all but four or five leaves of the manuscript of the first volume, which had been lent to John Stuart Mill. Carlyle accepted £100 from Mill as compensation for his loss.

In the years 1837, 1838, 1839, and 1840, Carlyle lectured to considerable yet select audiences on 'German Literature,' 'The Successive Periods of European Culture,' 'The Revolutions of Modern Europe,' and 'Heroes, Hero-worship, and the Heroic in History.' Carlyle's yearly earnings from these lectures, the last series of which has been published, varied between £135 and £300, and maintained him and his wife till the *French Revolution* not only established his reputation as a literary genius of the highest order, and as in Goethe's phrase 'a new moral force,' but placed him beyond the possibility of want. Yet, until

late in life, his annual income from literature was not more than £400. In 1838 appeared *Sartor Resartus* in book-form, and the first edition of his *Miscellanies*. The following year Carlyle, who at one time was not averse to the idea of becoming a personal force in politics, published the first of a series of attacks on the shams and corruptions of modern society under the title of *Chartism*. This he followed in 1843 with *Past and Present*, and in 1850 with *Latter-day Pamphlets*, which proved among other things that, if he did not quite approve of slavery, he disapproved of the manner in which it had been abolished in the British dominions. In 1845 appeared *Cromwell's Letters and Speeches*, perhaps the most successful of all his works, inasmuch as it completely revolutionised the public estimate of its subject. In 1851 he published a biography of his friend John Sterling. From this time Carlyle gave himself up entirely to his largest work, *The History of Friedrich II. commonly called Frederick the Great*, the first two volumes of which were published in 1858, and which was concluded in 1865. The preparation of this book led Carlyle to make two excursions to the Continent, which, with a yachting trip to Ostend, two tours in Ireland (on which he intended to write a book based on a diary that was published after his death), and regular visits to his kindred and friends in Scotland, formed the chief distractions from his literary labours. Among the few public movements with which Carlyle identified himself was that which resulted in the establishment of the London Library in 1839. In August 1866 he also allowed himself to be elected chairman of the committee for the defence of Mr Eyre, who had been recalled from his post of Governor of Jamaica on the ground of his having shown unnecessary severity in suppressing a negro insurrection which had broken out in October of the previous year, or as Carlyle put it, for having 'saved the West Indies and hanged one incendiary mulatto, well worth the gallows.'

On November 11, 1865, Carlyle was elected Lord Rector of Edinburgh University by a majority of 657 votes over 310 recorded for Mr Disraeli. On April 2, 1866, the ceremony of his installation took place amidst extraordinary demonstrations of enthusiasm, when he delivered an address in which he embodied his moral experiences in the form of advices to the younger members of his audience. The success attending this visit to Edinburgh was quite obliterated by the news which reached him in Dumfries of the death, on April 21, of Mrs Carlyle, as she was driving in her carriage in Hyde Park. Carlyle's grief developed into remorse when he discovered from certain of her letters, and from a journal which she kept, that during a period of their married life his irritability of temper and unconscious want of consideration for her wishes had caused her much misery and even ill-health, which she studiously concealed from him. It has also been demonstrated by the *Letters and Memorials of Jane Welsh Carlyle* that in the years 1855 and 1856 they were somewhat estranged, owing to Carlyle's liking for the society of Harriet, Lady Ashburton. After the death of Lady Ashburton there were no differences between them, except such as might be expected in the case of two persons of irritable and high-strung natures, and of uncompromising veracity. These *Memorials* are also of note as proving Mrs Carlyle to have been one of the keenest critics, most brilliant letter-writers, and most accomplished women, of her time.

Carlyle wrote no important work after his wife's death, although after a visit to Mentone in 1867, where he partially composed his personal *Reminiscences*, he settled down to his old life in London.

In August 1867 there appeared in *Macmillan's Magazine* his view of British democracy, under the title of 'Shooting Niagara.' He prepared a special edition of his collected works, and added to them in 1875 a fresh volume containing 'The Early Kings of Norway' and an 'Essay on the Portraits of John Knox.' On November 18, 1870, he wrote a letter to the *Times* on the Franco-German Question, defending the attitude of Germany. He expressed privately strong opposition to the Irish policy of Mr Gladstone. In February 1874 he was offered and accepted the Prussian Order of Merit in recognition of his having written the life of Frederick the Great, who founded the Order. Towards the end of the same year Mr Disraeli offered him the Grand Cross of the Bath (with the alternative of a baronetcy) and a pension of 'an amount equal to a good fellowship,' but he declined both.

His eightieth birthday, December 4, 1875, brought Carlyle many tributes of respect, including a gold medal from a number of Scottish admirers, and 'a noble and most unexpected' note from Prince Bismarck. On May 5, 1877, he published a short letter in the *Times*, referring to a rumour that Mr Disraeli, as Premier, meditated forcing on a 'Philoturb war against Russia,' and protesting against any such design. This was his last public act. On the 5th February 1881 he died at his house in Chelsea. A burial in Westminster Abbey was offered; but, in accordance with his own wish, he was laid in the churchyard of Ecclefechan beside his kindred. His wife is buried beside her father in the ruined choir of the church of Haddington.

The time has not yet come for the passing of a final judgment on Carlyle's position in British literature. He was above all things a prophet, in the guise of a man of letters, who predicted the reverse of smooth things for his country and for the world; and it has yet to be seen if his predictions will be fulfilled. But it may be said even now, and without risk of contradiction, that, for good or evil, he exerted a greater influence on British literature during the middle of the nineteenth century, and, through that literature, on the ethical, religious, and political beliefs of his time, than any of his contemporaries; that, as a humorist, using humour seriously and as a weapon for the enforcement of his opinions, he has no superior, combining in himself what is best in Dunbar, Burns, Rabelais, and Swift; that as a master of the graphic in style he has no rival and no second—showing an equal facility in photographing nature and in grasping and presenting in appropriate phraseology the salient points of personal character as exhibited in expression, habits, features, build, and dress.

Of Carlyle, as a man, it is also permissible to say that, irritable, impatient, intolerant, fiercely proud, occasionally hasty in his judgments though he was, preserving to the last, nor caring to get rid of, certain Scottish and Annandale rusticities of manner and mental attitude, no one was ever more essentially self-controlled, patient, and humble than he, or ever faced the real misfortunes of life with a calmer courage; that he was as incapable of conscious injustice, unkindliness, or vindictiveness, as he was of insincerity or impurity; that in pecuniary straits, even in despair, he never wrote a line that he did not believe, never swerved by a hair's-breadth from the noble purposes which dominated his life and extinguished all selfish ambition.

The leading authorities on Carlyle are his collected works, of which various editions have been published: *Reminiscences of Thomas Carlyle* (two editions: Froude's and Norton's); Froude's *Thomas Carlyle, a History of the first forty years of his Life, 1795-1835* (published in 1882); the same author's *Thomas Carlyle, a History of his Life in London, 1834-81* (published in 1884); *Letters and Memorials of Jane Welsh Carlyle* (1883); *Corre-*

spondence between Carlyle and Emerson, edited by Charles Eliot Norton (1883); *Early Letters of Thomas Carlyle*, edited by C. E. Norton (1886; second series, 1888); and *Correspondence between Goethe and Carlyle*, edited by C. E. Norton (1887). There are books on Carlyle by Wylie and Moncreux Conway (1881), Masson (1885), Garnett (1887), Nichol (1892), Chosterton (1903), Craig (1908), D. A. Wilson (1923 *et seq.*), and others; a bibliography of his works by Shepherd; a *Guide to Carlyle*, by A. Kalli (1920); Sir Gavan Duffy's *Conversations with Carlyle* (1892); the Life of Mrs. Carlyle by Mrs. Ireland (1891), and her Letters (1891, 1903). The question as to Froude's defects as a biographer was raised in Mr D. A. Wilson's *Froude and Carlyle* (1898); the question as to how far Froude was prejudiced by a false view as to the relations of Carlyle with his wife, expounded in Froude's posthumous work, *My Relations with Carlyle*, was sharply dealt with by Sir J. Crichton-Browne and Mr Alexander Carlyle in *The Nemesis of Froude* (1903), and Mr D. A. Wilson's *The Truth about Carlyle* (1913). There are annotated editions of the *French Revolution* (correcting Carlyle's slips) by J. H. Rose (1902) and C. R. L. Fletcher (1902), and of *Cromwell's Letters* by Mrs. Lomas (1904).

Carmagnola, a town of north Italy, 18 miles S. of Turin by rail. The *condottiere*, Francesco di Bartolommeo Bussone, afterwards Conte di Carmagnola, was born here in 1390. Pop. 5000.

Carmagnole, the name of a popular song and dance of the French Revolution, every verse of which ended with the refrain. 'Dansons la Carmagnole—vive le son du canon!'

Carman, WILLIAM BLISS, born at Fredericton, New Brunswick, in 1861, studied at New Brunswick, Edinburgh, and Harvard universities, and became an engineer, a teacher, and literary editor of the *New York Independent* (1890-92). His *Low Tide on Grand Pré* (1893) has been followed by many other volumes of verse, including *Songs from Vagabondia* (in collaboration with Richard Hovey, 1894-1909), *Echoes from Vagabondia* (1912), *April Aurs* (1916).

Carmania. See KERMAN.

Carmarthen (Welsh *Caer Fyrddyn*), the capital of Carmarthenshire, on the right bank of the Towy, in a picturesque situation. The 'winding Towy, Merlin's fabled haunt,' is navigable for vessels of 200 tons up to the town, which is 9 miles from Carmarthen Bay. Steele is buried in the old parish church; a ruined castle of the Welsh princes was in 1787 incorporated in a new county jail; Generals Picton and Notte, both natives, are commemorated by an obelisk and a bronze statue; a lunatic asylum (1863) and training-college (1847) may also be noticed. Near the town are tin and iron works; and Carmarthen exports tin-plates, slates, domestic produce, &c. Pop. 10,000.

Carmarthenshire, a maritime county of South Wales, washed on the S. by Carmarthen Bay, a semicircular inlet of the Bristol Channel, and bounded on the other sides by Pembroke, Cardigan, Brecknock, and Glamorgan shires. The largest of all the Welsh counties, it has a maximum length and breadth of 45½ and 26 miles, and an area of 947 sq. m., of which 70·8 per cent. is under cultivation. The county is mountainous in the north and east, and is characterised by productive though narrow valleys and deep, wooded glens; Carmarthen Van or Beacon (2596 feet) is the highest summit. The coast is marshy; the chief river is the Towy, which has a course of 65 miles, five-sixths in Carmarthenshire. It yields plenty of salmon, trout, eels, and lamprey, and is navigable for the last 9 miles of its course. On this river is the celebrated vale of the Towy, 30 miles long, with an average breadth of 2 miles. Carmarthenshire, north and west of the Towy, comprising three-fourths of the county, consists of Lower Silurian clay-slate and graywacke. In the

south-east corner of the county is a band of carboniferous limestone and grit, to which succeeds a small part of the great South Welsh coal-field, chiefly composed of stone-coal and culm. The mineral productions of the county are iron, coal, copper, lead, slates, lime, dark-blue marble; there is also some gold. These, with tinned iron, grain, cattle, horses, sheep, and butter, are exported. The climate is mild, but moist; the soil is stiff and poor in the uplands, affording pasturage for small cattle; but the rest of the county is well wooded, and in the south part along the rivers very fertile. Agriculture is rather backward; the chief crops are oats and barley. The principal towns are Carmarthen (the county town), Llanelly, Llandilo-vawr, Llandovery, and Newcastle-Emlyn. The chief manufactures are woollens and leather. Pop. (1801) 67,317; (1841) 106,326; (1921) 175,069, largely Welsh-speaking. Carmarthenshire sends one member to parliament for each of its Carmarthen and Llanelly divisions. Traversed by the old Roman Julian way, the county contains several so-called Druidical remains, the ruins of Dynevor and Carregcennin castles, and remains of four religious houses. It was the birthplace of the 'Rebecca' Riots (q.v.), directed in 1843-44 against the turnpike-gates.

Carmathians. See KARMATHIANS.

Carmaux, a great coal-mining centre in the French dep. of Tarn, 9 miles NE. of Albi by rail. Serious strikes and riots took place here in 1892. Pop. 10,000.

Carmel is a limestone-ridge which runs from SE. to NW. for 14 miles, forming the only great promontory on the low coast of Palestine. It attains a height of 1749 feet. On the east are the river Kishon and the Plain of Esdraelon. The name Carmel signifies 'orchard,' and the well-watered mountain is still richly clad with pine and holm-oak trees, and in its lower parts with olive, walnut, and bay trees, and a great variety of plants and flowers. Mount Carmel, the scene of Elijah's sacrifice, is renowned in Jewish history, and is often alluded to in the imagery of the prophets. On its north-west point, which rises 500 feet above the sea, there is a monastery, the monks in which are Carmelites (q.v.). The mountain's usual modern name, *Mar Elyas*, indicates its connection in the popular mind with the life of the great prophet.

Carmelites, or ORDER OF OUR LADY OF MOUNT CARMEL, a monastic order founded as an association of hermits on Mount Carmel by Berthold, a pilgrim or crusader from Calabria about 1156. A legend, however, ascribes the foundation of the order to the prophet Elijah; and another makes the Virgin Mary to have been a Carmelite nun. They received the rule of their order from the patriarch Albert of Jerusalem in 1209, and it was confirmed by Pope Honorius III. in 1224. Driven out by the Saracens, they settled first in Cyprus (1238), then in various parts of Western and Southern Europe, and at their first general chapter held at Aylesford in England in 1245, they elected as their head Simon Stock, under whom they were changed into a mendicant order by Pope Innocent IV. in 1247. From that time they shared in the usual vices of the mendicant orders. They subsequently divided into several branches, more or less rigid in their rules, one distinguished by walking barefooted (*discalced*). They were called White Friars from the cloak of their habit; their scapulary was of gray cloth. In 1880, 176 Carmelites were banished from France. On the English Discalced Carmelites, see *Carmel in England* (1899), by Zimmermann. The order of *Carmelites*, or *Carmelite Nuns*, was instituted by the Carmelite general Soreth in 1452, and is very numerous in Italy. It played a considerable

part in France in the 18th century, and counted among its members La Vallière and the daughter of Louis XV.

Carmen Sylva, the pen name of Elizabeth (1843-1916), queen of Rumania, the daughter of Prince Hermann of Wied Neuwied, and Maria of Nassau. She married King (then Prince) Charles of Rumania in 1869. Her only child, a daughter, died in 1874, and out of this great sorrow arose her literary activity. Two poems, printed privately at Leipzig in 1880 under the name 'Carmen Sylva,' were followed by *Sturme* (Bonn, 1881), *Leidens Erdengang* (Berlin, 1882; translated into English as *Pilgrim Sorrow* by Helen Zimmern, 1884), *Jehovah* (Leip. 1882), *Ein Gebet* (Berlin, 1882), &c.—in all nineteen volumes of German verse and one of English, besides novels and other works. Many of the translations in *Rumanische Dichtungen* (Leip. 1881) are hers. In *Pelesch-Marchen* (Leip. 1883) she worked into literary form many native traditions of her adopted country. In the war of 1877-78, as *mama rautlor* ('mother of the wounded'), she endeared herself to her people by her devotion to the wounded; and she fostered national women's industries. See *Life by Baroness Deichmann* (Eng. trans. 1890).

Carminatives, medicines to relieve flatulence and pain in the bowels, such as cardamoms, peppermint, ginger, and other stimulating aromatics.

Carmine (Arabic *Kermes*) is the red colouring principle obtained from the cochineal insect (see COCHINEAL). The method by which it is prepared is said to have been accidentally discovered by a Franciscan monk at Pisa, while compounding a medicine containing cochineal; and in 1656 its manufacture was begun. There are several processes by which carmine may be prepared, all of which in effect depend on exhausting powdered cochineal with boiling water, and precipitating the pigment by the addition of a weak acid or an acid salt. The following is an example of the processes: Digest 1 lb. of cochineal in 3 gallons of water for 15 minutes, then add 1 oz. of cream of tartar, heat gently for 10 minutes, add $\frac{1}{2}$ oz. of alum, boil for 2 or 3 minutes, and after allowing impurities to settle, the clear liquid is placed in clean glass pans, when the carmine slowly separates and deposits. After sufficient time the liquid is drained off, and the pigment is dried in the shade. It is alleged that bright sunny weather is essential to the production of the finest qualities. Hence it is said the United Kingdom is unfavourably situated for the manufacture; but the fact is that details of successful processes are guarded with jealous care; and in all probability brightness and purity of product are due to important minor details in the manufacturing process. Carmine is soluble in water, weak spirit, and in ammoniacal solutions; the latter agent affording a ready means of detecting the presence of the adulterants—chalk, China clay, and vermilion—frequently added to the costly pigment. Carmine is a most beautiful pinky red, sometimes used for silk and wool dyeing, but more sought for colouring fine confections, and dyeing feathers and artificial flowers; and it is not unknown as cosmetic rouge. Carmine Lake, prepared with alumina, is a most important artist's colour. There are various other tinctorial agents known under the name of carmine, of which the commonest are Archil Carmine made from Archil (q.v.); Brilliant Carmine Red, a lake of Brazil-wood; Indigo Carmine, a purple preparation of indigo, and Sorgho Carmine, obtained from the juice of the sugar or Chinese Sorghum, *Sorghum Saccharatum*.

Carmena, a town of Andalusia, Spain, 27 miles ENE. of Seville by rail, is picturesquely situated, and commands an imposing view of the valley

of the Guadalquivir. Julius Cæsar speaks of *Carmo* or *Carmona* as 'by far the strongest city of the whole province of further Spain.' Recent important excavations on the site of the ancient necropolis, to the west of the modern town, have brought to light a large number of tombs and funeral trichina in almost perfect preservation. Considerable portions of the Moorish wall and Alcazar still remain. Pop. 21,500.

Carnac, a village in the French department of Morbihan, 20 miles SE. of Lorient. It is remarkable on account of the number and variety of prehistoric and Gallo-Roman remains, consisting of menhirs, Dolmens (q.v.), and tumuli, with which the neighbourhood is studded. The principal group of menhirs is situated on a sterile moor near the seashore, and consists of 2700 or more rude monoliths of granite, resting with their smaller ends in the ground, rising, many of them, to a height of 18 feet, though a large proportion do not exceed 3 feet. They are arranged in 10 to 13 rows, about $\frac{1}{4}$ mile from east to west, but not quite alike in orientation, and have at one end a curved row of 18 stones, the extremities of which touch the outer horizontal rows. The object of the monument, in many ways mysterious, may have been commemorative. Smaller monuments of the same character as the great one at Carnac are found to the west of it at Erdeven and St Barbe. The Bosseeno, a group of mounds, about $\frac{1}{2}$ miles from Carnac, otherwise called 'Cæsar's Camp,' contains the principal Roman remains, and was first explored systematically by Mr Miln (1874-80). The result was the discovery of buildings giving evidence of the existence of a Gallo-Roman settlement at the Bosseeno. Numerous remains were found consisting chiefly of pottery (some of it very fine), tiles, bronze and iron objects, fine glass ware, Roman coins, statuary, and food refuse. While most of the pottery is evidently of Gaulish and Roman origin, many of the bronze ornaments are of Celtic type, and the coins all Roman, with dates from 200 to 353 A.D. The houses had evidently been destroyed by fire, but no human remains were found. See *STANDING STONES*, Miln's *Excavations at Carnac* (2 vols. 1877-81), and Worsfold's *French Stonehenge*. For Karnak in Egypt, see THEBES.

Carnahuba, or CARANAIBA PALM (*Copernicia cerifera*), a very beautiful and useful palm, which abounds in the northern parts of Brazil, in some places, particularly river-banks, forming vast forests. It attains a height of only 20 to 40 feet, but its timber is put to many uses, and is even fine enough for veneering. The olive-like fruit is eaten, and the seeds are roasted as a substitute for coffee; the terminal bud yields a palm-cabbage, and the pith a kind of sago; while the leaves are used in thatching, mat-making, &c. Like *Ceroxylon andicola*, this tree is also an important source of palm-wax; this substance exudes in scales from the under sides of the cut leaves, and drops off when these are dried and shaken. This wax is melted into masses, and beeswax is often adulterated with it. It has been used in the manufacture of candles. See *PALM, WAX*.

Carnallite, a mineral consisting of chloride of potassium and magnesium ($\text{KCl.MgCl}_2.6\text{H}_2\text{O}$), used as a source of magnesium.

Carnarvon, HENRY HOWARD MOLYNEUX HERBERT, EARL OF, born in 1831, from Eton passed to Christ Church, Oxford, where in 1852 he took a first-class in classics. He had succeeded his father as fourth earl in 1849, so now entered the Upper House as a Conservative, and in 1866 accepted from Lord Derby the office of Colonial Secretary. As such he had moved the second reading of an important bill for the confederation of the British North American colonies, when, with the

future Marquis of Salisbury, he resigned office upon the Reform Bill of 1867, which he regarded as democratic and dangerous. On Disraeli's return to power in 1874, Lord Carnarvon resumed office as Colonial Secretary, once more, however, to resign in January 1878 in consequence of the despatch of the British fleet to the Dardanelles. In 1885-86 he was Lord-lieutenant of Ireland, and his negotiations with Parnell gave rise, two years later, to controversy. Carnarvon, who died 28th June 1890, wrote *The Druses of Mount Lebanon* (1860), *Reminiscences of Athens and the Morea* (1869), and translated the *Agamemnon*, *Odyssey*, and *Prometheus Vinculus*. There is a Life by Sir A. Hardinge (1925).

Carnarvon (*Caer-yn-ar-Fon*, 'fort opposite Mon or Anglesey'), a parliamentary and municipal borough and seaport in North Wales, the capital of Carnarvonshire, stands near the south end of the Menai Strait, on the right bank of the Seiont, 69 miles W. of Chester. Carnarvon has a castle situated at the west end of the town, the building of which was commenced by Edward I. in 1283. It is one of the noblest ruins in the kingdom, the walls, which are 7 to 9 feet thick, being still entire, and inclosing an oblong of three acres. There are thirteen embattled towers, with five, six, or eight sides, and surmounted by turrets. The gateway under the great square tower has four porcupines. The town itself was once surrounded by walls and round towers. These walls, with several of the gates, still exist, but are now within the town. Carnarvon unites with Pwllheli, Nevin, Criccieth, Conway, Bangor, &c. in returning one member to parliament. The harbour admits ships of 400 tons. The chief exports are slates, stones, and ores. There are also iron and brass foundries. Carnarvon is a bathing-place, and is much frequented by tourists on account of its vicinity to the grandest scenery in North Wales, and its very convenient railway connections. Population, about 8000. Half a mile from Carnarvon are the remains, covering seven acres, of Segontium, or Caer Seiont, a Roman station or city. Gold, silver, and copper coins and ornaments, and other Roman relics, have been found here. There is a Roman fort on the left bank of the Seiont, still almost complete, with walls 11 feet high, and 6 feet thick. Carnarvon was the seat of the native princes of North Wales down to 873. In 1284 was born here the first Anglo-Norman Prince of Wales, afterwards the unhappy Edward II. In 1294 the town and castle were burned, and the English inhabitants massacred by the Welsh under Madoc, the illegitimate son of Llewelyn (see WALES). In 1910 Carnarvon witnessed the investiture of the Prince of Wales—the first time an English prince was invested within the principality.

Carnarvonshire, a maritime county of North Wales, bounded E. and S.E. by Denbigh and Merioneth shires, and on all other sides by the Irish Sea and the Menai Strait. With a maximum length and breadth of 34 and 23 miles, it has an area of 379 sq. m., of which 50·7 per cent. is under cultivation. The surface is grandly mountainous, traversed by the highest ranges in South Britain. The chief of these runs right along the middle of the county, from south-west to north-east, and is very bold and rocky. It attains its maximum altitude in Snowdon (q.v.), 3571 feet, in the centre of the county, the loftiest summit south of the Scottish Border. Carnarvon Bay is 34 miles across, and 16 deep, with 2 to 30 fathoms water; it communicates with the Irish Sea through the Menai Strait, which is 14 miles long, and 200 yards to 2 miles broad. The rivers of Carnarvon are numerous, but small. The chief is the Conway, which is navigable for 10 miles, and runs along the east border. Almost

all the streams flow through small lakes or tarns—of which there are 50 or 60 in the county—around the central or Snowdon group of mountains. There are many fine cataracts on these streams. Igneous rocks almost everywhere intrude on the Lower Silurian and Cambrian beds; and the mineral products of Carnarvon include copper, lead, zinc, coal, roofing and writing slates. The Penrhyn slate-quarries employ many thousands of workmen. The chief towns are Carnarvon (the county town), Bangor, Pwllheli, Conway, Nevin, and Criccieth. In addition to the above boroughs, several flourishing towns and tourist centres have come into prominence—Llandudno, Tremadoc, Bethesda, Bettws-y-Coed, Llanberis, and Beddgelert. The county returned two members to parliament—one for the south or Efon division, and one for the north or Arfon division; since 1918 one only. Pop. (1801) 41,521; (1881) 119,349; (1921) 131,034. Carnarvon contains several hill-forts, stone-circles, two Roman stations, some ruined castles, and vestiges of monasteries. The Snowdonian mountains were long the stronghold of the Welsh against invasion by the Romans, English, and Normans, but here they were conquered by Edward I. in 1277-82.

Carnatic, a region on the east or Coromandel coast of India, now included in the province of Madras, extending inland to the Eastern Ghats, and lengthwise from Cape Comorin to 16° N. It extended for about 600 miles along the east coast, and from 50 to 100 miles inland. The name *Karnataka* was originally applied by its Mohammedan conquerors to Mysore and the country above the Ghats. In course of time the term was first extended, and then exclusively applied to the country below the Ghats. The Carnatic is no longer an administrative division, but is memorable as the theatre of the struggle of the 18th century between France and England for supremacy in India.

Carnation, one of the finest of florists' flowers, a double-flowering variety of the Clove Pink (*Dianthus caryophyllus*, see PINK), and existing only in a state of cultivation, of which, however, we have traditions as early as the 13th century. The taller *Tree Carnations* (*D. fruticosus*, usually reckoned a sub-species or variety of the preceding) are less esteemed by florists. 'Scarlet, purple, and pink are the prevailing colours; but whatever are the colours of a carnation, it is of no value in the eyes of a florist unless they are perfectly distinct. Fullness and perfect regularity are also deemed essential.' Despite this crude standard of selective taste, happily now developing towards a subtler and more refined appreciation of form and colour, the varieties are extremely numerous: those which have only one colour, disposed in large stripes through the white ground of the petals, are called *Flake Carnations*; those which have two or three shades of colour, also in stripes, *Bizarre Carnations*; and those which have the edge bordered with a different colour from the white or yellow ground are called *Picotees*; in these the limb is often spotted and the petals fringed. By French florists a different but equally arbitrary classification is adopted. Carnations are propagated in summer either by layers or by *pipings*, which are short cuttings of shoots that have not yet flowered, each having two joints.

Carnauba. See CARNAUBA.

Carneades, a Greek philosopher, born at Cyrene, in Africa, about 213 B.C. He studied logic at Athens under Diogenes, but became a partisan of the Academy, and an enemy of the Stoics, whose stern and almost dogmatic ethics did not suit his sceptical predilections. He was in fact one of the most important of the ancient sceptics, and held that no criterion of truth exists

either in the senses or the understanding of man. He was founder of the Third or New Academy. As ambassador at Rome, in one oration he eulogised justice, and in a second proved that it did not exist. Cato moved that he be sent home as a corrupter of youth. He died at Athens in 129 B.C.

Carnegie, ANDREW (1835-1919), son of an owner of hand-loom, ruined by the power-loom, was born in Dunfermline, whence with his parents and younger brother he emigrated in 1848 to Pittsburgh in Pennsylvania. After tending a small engine, he was successively telegraph messenger and operator, railway clerk, and railway superintendent. Fortunate investments in oil were followed by the establishment of a rolling-mill, from which grew up the largest system of iron and steel works in the world, centred at Homestead near Pittsburgh. In 1898 he bought Skibo Castle on the Dornoch Firth, and subsequently withdrew from business with a fortune of as many millions as most rich men have thousands. Holding that 'he who dies rich dies disgraced,' Mr Carnegie, who never speculated, or bought or sold stocks, gave generously and on an unparalleled scale for public purposes, especially for libraries in Great Britain, the United States, and Canada—Pittsburgh, New York, Allegheny City, St Louis, Edinburgh, and Glasgow being amongst the largest recipients. In 1901 he made over to trustees £2,000,000 five per cent. bonds (giving an income of £104,000) for the better equipment of the Scottish universities in science, medicine, economics, history, English literature, modern languages, technical and commercial education; for the endowment of research; and for paying the university fees of students Scottish born or of Scottish extraction—any surplus income to go to support lectureships or evening classes. In the next year he founded the Carnegie Institution in Washington, and endowed it with a like sum, also for the promotion of research and education. Again, in 1905, he gave £2,000,000 to provide pensions for American university and college teachers. To the Carnegie Corporation of New York he gave about £25,000,000, with wide powers. His benefactions had at his death reached more than £70,000,000. They include large sums for the Pittsburgh Carnegie Institute, for the improvement of the city of Dunfermline, for church organs, for The Hague Palace of Peace, and for Hero Funds in Britain, America, and France. His reputation as an employer was not good. He wrote *Triumphant Democracy* (1886), *The Gospel of Wealth* (1901), *The Empire of Business* (1902), a Life of James Watt (1905), and an Autobiography (1920).

Carnelian, or CORNELIAN (Lat. *cornelius*, confused with *carneolus*, flesh-coloured), a fine kind of Chalcedony (q.v.), blood-red or reddish-white.

Carniola (Ger. *Krain*), formerly a south-west Austrian land, was in 1919 assigned mostly to Yugoslavia. A small part in the west (including Adelsberg and Idria) went to Italy. Most of the inhabitants are Slovenes, the remainder Germans and Croats. It is traversed in the north by a continuation of the Carinthian Alps, and in the south by the Julian Alps, the loftiest summit being the Terglon (9393 feet), between the two sources of the Save, which is the principal river. The scenery of the county abounds in interesting and singular features, amongst which are Lake Zirknitz (q.v.), and the rock-bridge of St Kanzian, 131 feet high, and 164 feet broad, with a perfect arch 65 feet high. Flax, silk, maize, honey, wine, and much fruit are produced. The chief minerals are iron and brown coal. Laibach (Slov. *Ljubljana*) is the capital. From 972 Carniola had margraves of its own; but in 1245 and 1364 it passed to the

Dukes of Austria. See three historical works by Dimitz (6 vols. Laibach, 1874-86).

Carnival (Ital. *Carnevale*; from late Lat. *carnelevamen*, 'a solace of the flesh'; incorrectly explained as if meaning 'farewell to flesh,' as in Byron's *Beppo*), a festival which originally began on the day following the feast of the Epiphany, and continued till midnight on Shrove-Tuesday. With Ash-Wednesday of course began the fast of Lent, which made an end of the preceding feasting, masquerading, and buffoonery. In later times, the Carnival was limited to the time of from three to eight days before Ash-Wednesday. Without doubt the forms and customs still preserved in the celebration of the Carnival originated in the heathen festivals of spring-time; and they still remind us partly of the Lupercalia and Bacchanalia of Southern Europe, and partly of the Yule-feast among northern peoples. Banquets of rich meats and drinking-bouts were the chief attractions of the Carnival during the middle ages. Shrovetide, or Shrove-Tuesday, called also Fasten-Even or Pancake-Tuesday, was a relic of the English Carnival, and formerly a season of extraordinary sport and feasting. The rich commenced the festive time at the feast of Epiphany, or on 'Three Kings' Day; but the middle classes restricted their days of revelry to the week immediately preceding Lent; while the poor indulged in only a few days of mad mirth. The several chief days of Carnival had distinct names, such as 'fat' or 'greasy Sunday,' 'blue Monday' (or 'fools' consecration'), &c. The Tuesday before the beginning of Lent was especially styled Carnival—the *Fastnacht* of the German people. In Germany it is celebrated in the cities of the Rhine provinces, but has even been revived in the austerer north—in Leipzig, Hamburg, and Berlin. In most countries the celebration is confined to wearing of masks, processions in costume, and masked balls. In the south of France and throughout Italy, especially in the cities, it is still a popular festival of universal observance. Venice used to be pre-eminent for the splendour of its carnivals; at Rome races of riderless horses (*barbieri*) along the crowded Corso were, till well into the 19th century, one of the chief items in its celebration. In many places flowers and plaster *confetti* are thrown from the windows and balconies on the occupants of the carriages and processional cars in the streets, with a return fire from below.

Carnivora, a well-defined order of Mammals more or less efficiently adapted for predaceous life, and including most of the forms popularly known as Beasts of Prey. It partly corresponds with the order *Feræ* defined by Linnæus, but the latter included also Marsupials and Insectivora. Not all animals carnivorous in diet are Carnivora in structure, for the Dasyure or Tasmanian Devil is a Marsupial, and the blood-sucking *Desmodus* is a bat. Nor are all the members of the order Carnivora in diet purely carnivorous, for the polar bears eat grass greedily, the rats are very partial to honey, and many forms eat fruits, berries, insects, molluscs, or crustaceans in a highly omnivorous manner.

General Characters.—The dentition of most Carnivora is very characteristic; there are in each jaw six pointed cutting teeth, two strong sharp recurved canines, and molar teeth often adapted for cutting. The skull is short and dense. The lower jaw works up and down in a deep transverse semi-cylindrical groove, and there are deep hollows on the sides and prominent crests on the roof of the skull for the reception and insertion of the powerful muscles which work the jaw. The toes are clawed, with more or less pointed nails almost always well developed.

As one would expect in animals with a vigorous life-experience, the convolutions of the brain and olfactory lobes are well developed. In contrast to herbivorous animals, the stomach is simple, and the

Skull of Tiger.

cæcum or blind process of the intestine is either absent or small. The placentation is deciduate and generally zonary. Carnivorous diet, vagrant predatory habit, fierce disposition, and high intelligence are familiarly characteristic.

Classification.—It becomes at once necessary to distinguish two sub-orders (a) the typical, terrestrial Carnivora (*Fissipedia*), and (b) the aberrant, aquatic forms (*Pinnipedia*), which may be thus contrasted:

FISSIPEDIA	PINNIPEDIA
Terrestrial, at most partially aquatic	Aquatic, except at birth.
Special cutting back tooth in each jaw.	Very uniform back-teeth.
Incisors almost always 3.	Always fewer
Strong curved sharp claws.	Webbed feet
First and fifth digits of hind-foot never longer than the others.	Outmost and inmost toes of hind-foot predominate in length and strength.

The second sub-order, with its numerous adaptive characters, has doubtless been derived from the first, and is divided into three families, with about fifty species: (1) *Otariidæ* (Sea-bears), nearest the typical Carnivores, (2) *Trichechidæ* (Walrus), and (3) *Phocidæ* (Seals). Some Tertiary fossil forms are known, but they are not nearer the typical Carnivores than those now existing.

Cuvier proposed to divide the typical carnivores into Plantigrades, walking on the entire sole—e.g. bears, and Digitigrades, walking on finger-tips—e.g. cats; but these physiological differences are rendered useless by the multitude of transitional links connecting them, and besides, as an accurate fact, the majority of Carnivores 'belong to neither one form nor the other, but may be called sub-plantigrade.' It is at once more accurate and useful to divide the typical Carnivores into three sections, represented familiarly by bear, dog, and cat, and technically known as *Arctoidea*, *Cynoidea*, *Æluroidæa*. The distinctions are based on certain features in the base of the skull, but are corroborated by other more general characteristics. There are about 300 living species.

(1) The *Arctoidea*, which are least specialised, and nearest the aquatic sub-order, include the following families: (a) *Mustelidæ*—e.g. Otter (*Lutra*), Sea-otter (*Enhydra*), Skunk (*Mephitis*), Sand-bear (*Arctonyx*), Badger (*Meles*, *Taxidea*), Ratel (*Mellivora*), Grison (*Galicotis*), Marten and Sable (*Mustela*), Stoat or Ermine (*Putorius*), Glutton (*Gulo*), &c.; (b) *Procyonidæ*—e.g. Raccoon (*Procyon*), Coati (*Nasua*), Kinkajou (*Cercoleptes*); (c) *Ailuridæ*—e.g. Panda (*Ailurus*); (d) *Ursidæ*—e.g. Bear (*Ursus*).

(2) The *Cynoidea*, occupying a median position, include numerous forms in two series represented by Dog (q.v.) and Fox (q.v.).

(3) The *Æluroidæa*, comprising the most specialised carnivores, include four families (a) *Felidæ*—e.g. Cat, Lion, Tiger, Jaguar, Cheetah (*Felis*); (b) *Viveridæ*—e.g. Civet (*Viverra*), Binturong (*Arctictis*), Ichneumon (*Hepestes*); (c) *Hyænidæ*—e.g. Aardwolf (*Proteles*), and Hyæna.

Pedigree and History.—The fossil history of Carnivora is of great interest, for not only have some remarkable forms like the sabre-toothed tiger (*Machairodus*, q.v.) been unearthed, but the various families are linked together, as the cats and civets by *Proviverra*, and the ancestors of at least the cats and the dogs are found in primitive generalised carnivores, such as *Miacis*, *Oxyæna*, and *Arctocyon*. The group affords beautiful illustration of increasing and of divergent specialisation as illustrated in the passage from primitive forms to the lion on the one hand and the seal on the other. As to the relation of the Carnivora to other orders of mammals, speculation is rife, but firmly based conclusions hard to find. Looking backward, some naturalists have discovered affinities with the marsupials, while others looking forward have with more abundant evidence regarded the primitive carnivores as ancestral to Insectivora, and through them to Cheloptera. Some, again, find affinities between *Uta* and carnivores, though this is vigorously denied by other authorities. See Huxley, *Anatomy of Vertebrate Animals*; and Flower, *Osteology of Mammalia*.

Carnivorous Plants. See INSECTIVOROUS PLANTS, *DIONEA*.

Carnot, LAZARE NICOLAS MARGUERITE, the 'organiser of victory' during the early wars of the French Revolution, was born at Nolay, Burgundy, in 1753. He entered the army as engineer. In 1791 he became a member of the Legislative Assembly, and in the Convention voted for the death of Louis XVI. During a mission to the army of the north, he took temporary command and gained the victory of Wattignies. On his return he was elected into the Committee of Public Safety and intrusted with the organisation of the armies of the Revolution, in that task displaying marvellous energy and ability. In a short time he raised fourteen armies, and drew up a plan of operations, by which the forces of the European reaction were repelled from the frontier. Though he endeavoured to restrict the power of Robespierre, he was accused, with others, after the Reign of Terror; but the charge was dismissed. Carnot was a member of the Directory at its institution in 1795, but in 1797, having opposed the extreme measures of Barras, his colleague, he was sentenced to deportation as a suspected royalist. He escaped into Germany, where he wrote his defence, which conduced to the overthrow of his colleagues in 1799. The 18th Brumaire brought him back to Paris, where he was made Minister of War, 1800; and by his energy, skill, and fertility of administrative resource, helped to achieve the brilliant results of the Italian and Rhenish campaigns. He retired, however, from his office when he understood the ambitious plans of the emperor, but hastened, when he witnessed the reverses of the empire, to offer his services to Napoleon, who gave him the command of Antwerp in 1814, which he heroically defended. During the Hundred Days he held office as Minister of the Interior; and after the second restoration retired first to Warsaw, and next to Magdeburg, where he died in 1823. Of his numerous writings on mathematics, military tactics, &c., the best is *Réflexions sur la Métaphysique du Calcul Infinitésimal* (1797).

See his *Memoires* (2 vols. 1831-64), and the *Lives* of him by Arago (1850) and Picaud (1885).—His son, NICOLAS LEONARD SADI, founder of the science of thermo-dynamics, was born at Paris, 1st June 1796; studied at the Polytechnic, served in the engineers, and became captain; but died of cholera, 24th August 1832. His principal work is the *Réflexions sur la Puissance du Feu* (1824), (see THERMO-DYNAMICS).—Another son, LAZARE HIPPOLYTE CARNOT, born at St Omer, 6th April 1801, one of the leaders of the French democracy, was in early life a disciple of St Simon, but, like others, left that school on account of the lax morals advocated by *Enfantin*—protesting against 'the organisation of adultery'—and devoted himself to the inculcation of a more orthodox and virtuous socialism in various periodicals. After the February Revolution (1848) he was appointed Minister of Public Instruction, but soon resigned. In 1863 he entered the Corps Législatif, and the National Assembly in 1871. He was elected a senator for life in 1875, and died 16th March 1888. He wrote an *Exposé* of St Simonianism and *Mémoires* of Henri Grégoire and of Banière.—MARIE FRANÇOIS SADI CARNOT (1837-94), French President, was born at Limoges, the eldest son of the last named. He studied at the Ecole Polytechnique, and was a civil engineer. In 1871 he was chosen to the National Assembly, and was finance minister in 1879, as also in 1887. Distinguished for integrity and moderation, he was in 1887 chosen President of the Republic, but was assassinated at Lyons by an anarchist.

Carnotite, a mineral composed of hydrated vanadate of uranium and potassium; a source of radium.

Carnoustie, a coast-town of Forfarshire, 11 miles E.N.E. of Dundee, with exceptionally fine golf links; pop. 6000.

Carnuntum, a Celtic town of Pannonia, on the Danube, of naval, military, and commercial importance in Roman days. Only extensive ruins of the town, destroyed by the Magyars in the 9th century, now remain, near Hainburg, Lower Austria.

Caro, ANNIBALE, Italian author and poet, born at Cittanuova in Ancona, 1507, lived as secretary with a succession of cardinals, and died at Rome in 1566. Only two humorous works appeared during his lifetime; the rest of his writings, including the *Rime*, a translation of the *Æneid*, a play, and four series of letters, have been most of them often republished, and, from their elegant style and masterly handling of Tuscan, are still esteemed classics.

Caro, ELME MARIE, a French philosopher, was born at Poitiers, March 4, 1826. After studies at the Ecole Normale of Paris, and at Angers and Douai, he became in 1857 a lecturer at the Ecole Normale, ten years later professor at the Sorbonne. In 1874 he was elected to the French Academy. He died 13th July 1887. His Wednesday lectures at the Sorbonne were exceedingly popular, and were never too difficult for the fashionable ladies who thronged to hear them. Pailleron made 'le philosophe des dames' the butt of his clever raillery in his well-known comedy *Le Monde où l'on s'ennuie*. Caro's chief works are *Le Mysticisme au XVIII. Siècle* (1852-54), *L'Idée de Dieu et ses nouveaux Critiques* (1864), *Le Matérialisme et la Science* (1868), *Le Pessimisme au XIX. Siècle* (1878), *La Philosophie de Goethe* (2d ed. 1880), *George Sand* in 'Les Grands Écrivains Français,' and *Mélanges et Portraits* (1888).

Carob, ALGAROA, or LOCUST-TREE (*Ceratonia siliqua*), a tree of the order Leguminosæ, sub-order Cæsalpinieæ, a native of the Mediterranean countries. In size and manner of growth it some-

what resembles the apple-tree, but with abruptly pinnate dark evergreen leaves, which have two or three pair of large oval leaflets. The flowers are destitute of corolla; the fruit is a brown leathery pod, 4 to 8 inches long, a little curved, and containing a fleshy and at last spongy and mealy pulp, of an agreeable sweet taste, in which lie a number of shining brown seeds, somewhat resembling small flattened beans. The seeds are bitter and of no

Branch of Carob.

value; they were formerly used as weight, by jewellers; and *Carat* (q.v.) may come from *kera-ton*, a Greek name for them. The pods are an important article of food to the poorer classes of the countries in which the tree grows. In Cyprus, &c., they are even pressed for their sugar, the residue being given with fodder. They are much used by the Moors and Arabs. They are also valuable as food for horses and cattle, for which they are much employed in the south of Europe, and are also imported into Britain under the name of Locust Beans, which name and that of St John's Bread they have received in consequence of an ancient opinion or tradition, that they and not the true (insect) locust are the 'locusts' which formed the food of John the Baptist in the wilderness. It seems more probable that they are the 'husks' (*kera-ton*) of the parable of the Prodigal Son.—The Arabs make of the pulp of the carob a preserve like tamarinds, which is gently aperient.—The carob-tree is too tender for the climate of Britain, but its extensive introduction into the north of India has been recommended. The produce is extremely abundant, some trees yielding as much as 800 or 900 lb. of pods. The wood is hard, and much valued, and the bark and leaves are used for tanning.—The LOCUST-TREE (q.v.) of America is quite distinct from this.

Carol, originally a term for a dance, or for songs intermingled with dancing, came afterwards to signify festive songs, particularly such as were sung at Christmas. In England the practice of singing Christmas carols was widely spread as early as the 15th century, to which date belong many of the carols printed in the collections of Ritson, Wright, and Sandys. Some of these ancient carols—'Cherry Tree Carol,' the 'Carol of St Stephen,' and others—preserve curious legends that have descended from a remote past. Unfortunately many of the traditional carols are not extant in early manuscript copies, and were greatly corrupted when they found their way into print. In the second half of the 18th century, a Birmingham publisher, T. Bloomer, did good service by issuing (in broadside form) all the carols that came to his notice. The first printed collection of carols

came from the press of Wynkyn de Worde in 1521. A unique fragment of it is extant, containing the famous 'Boar's Head Carol,' which is still sung at Queen's College, Oxford, on Christmas-day. Another collection (of which only a fragment has come down), printed by Richard Kele, appeared about 1550. In Ravenscroft's *Melismata* (1611) is found the carol 'Remember, O thou Man,' with musical accompaniment; and there are well-known carols, of a somewhat later date, among the *Roxburghe Ballads*. Besides the sacred carols that were sung in the open air, there were jovial carols that were sung at Christmas feasts. A small black-letter collection of these pieces was published in 1642, another in 1661, another is undated, and a fourth appeared in 1688. These collections, which are of the highest rarity, contain curious specimens of the songs that were sung by shepherds and ploughmen at Christmas entertainments in farm-houses. The Puritans did their best to discourage carol-singing; but the practice revived at the Restoration, and continued throughout the 18th century. Hone, writing early in the 19th century, predicted that in the course of a few years Christmas carols would be heard no more. His prediction has not been fulfilled; but for some time past it has been a growing practice to sing carols in churches instead of in the open air, and the quaint fantastic carols of old days are in consequence falling out of remembrance. William Sandys' *Christmas Carols, Ancient and Modern* (1833), is a very complete collection; and see Miss Rickert's *Ancient English Christmas Carols* (1909). In France the singing of Christmas carols, called *noëls*, was common at an early date. Collections of *noëls* were published early in the 16th century. In 1701 a collection was published at Dijon, in the dialect of the country. Another edition, with the title *Noël Borquignon de Gui Berdzan*, containing thirty-four *noëls* and two chansons, with music and glossary, appeared in 1720. Russian literature is very rich in carols, and religious songs generally. The best collection of them is by Bezsonov, under the title *Kalielei Perelchozhie*, or 'The Wandering Cripples,' the singers being beggars and lame people who go about for charity. There is a large store of Manx carols, or *carroal*, but only a very few have been printed. The *Llyfr Carolan*, or 'Book of Carols' (1740), contains sixty-six Welsh Christmas carols.

Carolina. See NORTH CAROLINA, SOUTH CAROLINA.

Carolina Pink. See SPIGELLA.

Caroline OF ANSBACH (1683-1737), the queen of George II. (q.v.). For her granddaughter, Caroline Matilda, see STRUENSEE, and a book by W. H. Wilkins (1904).

Caroline, AMELIA ELIZABETH, wife of George IV., was the second daughter of Charles William, Duke of Brunswick-Wolfenbüttel, and of George III.'s sister, the Princess Augusta of Britain. She was born on 17th May 1768. Ill-educated, vulgar in manner, and indiscreet, though kind-hearted enough, she was married to the Prince of Wales in 1795. The marriage was disagreeable to him, and although she bore him a daughter, the Princess Charlotte, he separated from her immediately on her recovery from childbirth; and she lived by her self at Shooters Hill and Blackheath, the object of much sympathy, the people regarding her as the victim of her husband's love of vice. Reports to her discredit led the king in 1806 to cause investigation to be made into her conduct, which was found to be imprudent, but not criminal. In 1814 she obtained leave to visit Brunswick, and afterwards to make a farther tour. She visited the coasts of the Mediterranean, and lived for some

time on the Lake of Como, an Italian, by name Bergami, being all the while in her company. When her husband ascended the throne in 1820, she was offered an annuity of £50,000 sterling to renounce the title of queen, and live abroad; but she refused, and made a triumphal entry into London, whereupon the government instituted proceedings against her for adultery. Much that was very reprehensible was proved as to her conduct; but the manner in which she had been used by her husband, and the splendid defence of Brougham, caused such a general feeling in her favour, that the ministry were obliged to give up the Divorce Bill after it had passed the House of Lords. She now fully assumed the rank of royalty, but was refused coronation, and turned away with needless brutality from the door of Westminster Abbey on the day of the coronation of her husband, on 19th July 1821. On 7th August she died.

Caroline Islands, a group in the Western Pacific, lying between the Marshall and Pelew islands, with an area of about 270 sq. m., and a pop. of some 22,000; but the Pelew (q.v.) group is generally included in the Caroline Archipelago (area, 560 sq. m.; pop. 40,000), which thus stretches across 32 degrees of longitude and 9 of latitude. There are some 500 small atolls in the archipelago, but three-fourths of both area and population are included in the five volcanic islands of Babelthouap, Yap, Ronk, Ponapé (Ascension), and Kusari (Strong Island); these are all fertile and well watered, and many of the low-lying lagoons, though less so, are well wooded and to some extent inhabited. The climate is moist, but not unhealthy, and is tempered by cooling breezes. The people belong to the Micronesian stock, are strongly built, and are gentle, amiable, and intelligent; they are bold sailors, and carry on a brisk trade with the Ladrões to the north, where they have several settlements. Besides the usual products of the Polynesian islands, Copra (q.v.) has been largely exported. The islands were discovered in 1527 by the Portuguese, and called *Sequeia*; in 1686 they were annexed and rechristened in honour of Charles II. by the Spaniards, who, however, shortly changed the name to New Philippines. After the failure of several missionary attempts in the 18th century, Spain took little active interest in the group, until 1885, when the German flag was hoisted on Yap. In the sharp dispute which followed, the pope as arbitrator decided in favour of Spain. In 1887 disturbances broke out at Ponapé, in which the governor was killed by the natives. In 1899 the Caroline Islands were sold to Germany, Spain retaining a coaling-station. Seized in 1914, they are now held by Japan under the League of Nations. Yap (with a cable station) was a subject of dispute with the United States, settled 1921.—A British Caroline Island near the Marquesas is only 2 sq. m. in area.

Carolings. See CARLOVINGIANS.

Carotid Artery, the great artery which on each side distributes blood to the different parts of the head, appears to have derived its Greek name *carotis* from Gr. *karos*, 'sleep,' there being an old idea that deep sleep was caused by the increased flow of blood through the carotids. Each carotid artery consists of the primitive or common carotid, which, at the upper margin of the larynx or organ of voice, separates into two great divisions, of nearly equal size—the external and the internal carotids. The external carotid supplies the larynx, pharynx, tongue, face, and scalp with blood; its principal branches being the superior thyroid, the lingual, the facial, the occipital, the posterior auricular, the internal maxillary, and the temporal. The internal carotid enters the cavity of the

cranium through a somewhat tortuous canal in the temporal bone, and after perforating the dura-mater, or fibrous membrane of the brain, separates into the anterior and middle cerebral arteries, which are the principal arteries of the brain; while in its course through the dura-mater, it gives off the ophthalmic artery. See AORTA, CIRCULATION.

Carouge, a Swiss town $1\frac{1}{2}$ mile S. of the city of Geneva. Pop. 7400.

Carp (*Cyprinus carpio*), a bony, fresh-water fish, in the physostomatous division, and type of the large family Cyprinidae. The body is covered with large scales; the head is naked; the wide, thick-lipped, terminal mouth is toothless, but there are teeth in the throat; a small barbule occurs on the upper jaw, and a large one at the corner of the mouth; the dorsal fin is long, the anal short, and

Carp (*Cyprinus carpio*):

a, fore-fin; b, hind-fin; c, anal fin; d, large barbule.

both have the third ray strong and toothed; the hind-fins lie about the middle of the ventral surface. The back is blackish gray or brown, the sides yellowish brown, the belly yellow. At the reproductive season the male bears white or brown tubercles on the head and sides. The usual length is between 1 and 2 feet, but large forms 5 feet long or more have been caught.

The carp is mainly vegetarian, but also eats small animals, such as larvae and worms. The general habit is sluggish, except at the spawning period in May and June. The fecundity is very great; a single ovary of a moderate-sized specimen contains 700,000 or so eggs. They prefer ponds and the quiet parts of rivers. In winter they hibernate in the mud. Their longevity is great; some are said to have lived one hundred and fifty to two hundred years. The original home of the carp was in the central regions of Asia and probably also Europe, but it has been artificially spread everywhere—for instance in North America. They may be kept alive for weeks in damp moss; but are liable to skin diseases, and grow gray with mould. The carp was introduced into England before the 15th century. Fancy varieties have been reared, such as the King-carp, with few rows of large scales, and the Leather-carp, which is quite naked. *C. Kollarii* is a hybrid between carp and crucian (*Carassius*), or German carp, which like the Gibel (*C. Gibelio*) or Prussian carp, has no barbules. The Goldfish (q.v.) is *C. auratus*. The carp is a difficult fish for the angler, as it is by no means a free biter. It is an important food fish, and is easily bred. A good carp-pond, in Germany especially, is a by no means unimportant source of income. The carp is largely bred in the United States. See CRUCIAN.

Carpaccio, VITTORE, a painter of the early Venetian school, was born in Venice about 1455, and was early influenced by the Vivarini and Gentile Bellini. His rich colouring and accurate knowledge of perspective, his boundless invention and fancy, his powerful delineation of character, and his love of varied incident, are amply visible

in the nine subjects from the life of St Ursula, which he painted, 1490-95, for the school of St Ursula, Venice, and which are now preserved in the Accademia there. About 1494 he executed another work now in the same collection, 'The Patriarch of Grado casting out a Devil.' His next great series of works was the nine subjects from the lives of the Saviour, and Saints Jerome, George, Tryphonius, 1502-8, painted for the school of San Giorgio de Schiavoni, and still preserved there. In 1510 he executed for San Giobbe the noble 'Presentation in the Temple,' now in the Accademia, which is usually regarded as his masterpiece. His later works show a marked decline in power. Among these may be mentioned an altar-piece in San Vitale, Venice, 1514, and a group of ladies with pet dogs and birds (most unduly praised by Ruskin) in the Correr Museum. His latest dated work, at Pirano and Pozzale, are inscribed 1519; and he is believed to have died about 1522. The 'Virgin and Child adored by the Doge Mocenigo,' assigned to him, in the National Gallery, London, is probably not his. See a book by Molmenti and Ludwig (trans. Cust, 1907), and Crowe and Cavalcaselle.

Carpathian Mountains, the second great range of central Europe, extend in a great semicircle over a space of 880 miles from Piesburg on the Danube to Orsova on the same river. They form two great masses, one in Czechoslovakia and Galicia to the NW., and one in Transylvania to the SE., with ranges of lower and wooded mountains between. The highest group of the Slovakian Carpathians is that of Tatras, reaching 8737 feet in the Gerlsdorfer Spitze; on the northern declivity small glaciers exist. Many of the western mountains are of limestone, while the mountains of Transylvania are mostly of primitive rocks. On the eastern and southern borders the latter reach their greatest height; Negoi, the culminating peak, has an elevation of 8320 feet. The range is generally clothed with wood to a height of 4000 feet, and with precipices, ravines, and volcanic cones, exhibits scenes of rare grandeur.

Carpathian Ruthenia (*Podkarpatska Rus*), a Ruthenian district on the south side of the Carpathians, taken from Hungary and made an autonomous province of Czechoslovakia; area, 5000 sq. miles; pop. 600,000 (370,000 Ruthenians, 104,000 Magyars, 80,000 Jews); capital, Uzhorod (Mag. *Ungvár*); pop. 20,000.

Carpathos. See SCARFANTO.

Carpeaux, JEAN BAPTISTE, sculptor, was born at Valenciennes, 14th May 1827, and in 1854 obtained the *Prix de Rome*. His bronze Neapolitan boy attracted notice; and 'Ugolino and his four Sons' (1863), also in bronze, though it defied the canons of sculpture, made him famous. He settled in Paris in 1862. His *chef d'œuvre*, the marble group, 'The Dance,' in the façade of the New Opera in Paris, fully showed his dramatic power and the exuberance of his imagination; but it provoked much hostile criticism as involving an attempt to stretch beyond their natural province the limits of the plastic art. The most notable of his later works is the great fountain in the Luxembourg Gardens. He died 11th October 1875.

Carpel (Gr. *karpōs*, 'fruit'), in Botany, a modified leaf forming the whole or part of the gynæcium or female (ovule-bearing) organ or organs of a flower (see FLOWER). The number of carpelary leaves may vary greatly; at first indefinite in the simplest flowers (e.g. Ranunculaceæ), it becomes definite, and may even be reduced to one (e.g. Leguminosæ, Berberidaceæ). The carpels may also unite more or less completely to form a compound ovary with or without united styles or

stigmas. This is characteristically three-celled in most monocotyledons (e.g. Liliaceæ), and five or two celled in most dicotyledons. The carpellary leaves, like any others, are in their simplest forms at first individually developed, and are clearly recognisable as reduced foliage leaves in Cycadaceæ. In Coniferæ they are further reduced, while in Angiosperms they never fully open as leaves at all, save sometimes in the splitting of the fruit after maturity. For their relation to the ovule, see OVULE, REPRODUCTION, SEED.

Carpentaria, GULF OF, a long and broad indentation of the north coast of Australia, stretching from 11° to 17° 30' S. lat., and from 136° to 142° E. long. Its name is said to have been derived from the river Carpentier, so named by Carstenz in 1623, in honour of Pieter Carpentier, governor-general of the Dutch Indies. The gulf contains many islands. Its eastern boundary is Cape York Peninsula. On the east it receives the Mitchell and Van Diemen rivers; at the south the Flinders, Leichhardt, and Albert; and on the west the Roper.

Carpenter, EDWARD, poet, born at Brighton in 1844, studied at Cambridge, and relinquished holy orders for lecturing, market-gardening, socialist propaganda, and literature. Walt Whitman he visited, wrote about, and followed, in verse-form as in democratic aims. His writings include *Towards Democracy* (1883-1902), *Civilisation, its Cause and Cure* (1889), *Love's Coming of Age* (1896), *The Art of Creation* (1904), *The Drama of Love and Death* (1912), *My Days and Dreams* (an autobiography, 1916), *Towards Industrial Freedom* (1917), *Pagan and Christian Creeds* (1920).

Carpenter, JOSEPH ESTLIN, theologian, was born in 1844, a son of W. Benjamin Carpenter (q.v.). He was lecturer (1875-1906) and principal (1906-15) of Manchester College. Besides *The Historical Jesus* (1911) and other theological books, he wrote on James Martineau and on his aunt Mary Carpenter (q.v.).

Carpenter, MARY, philanthropist, was born at Exeter, 3d April 1807, the eldest child of Lant Carpenter, LL.D. (1780-1840), Unitarian minister there, and afterwards at Bristol. The visit of Rammohun Roy to Britain in 1833, and of Tuckerman, the Boston philanthropist, had helped to turn her attention and sympathy towards India, and towards the destitute children of her own country. Trained as a teacher, she not only advocated the cause of neglected children in her writings, but founded in 1835 a 'working and visiting society,' of which she was secretary for more than twenty years, opened a ragged school in one of the worst parts of Bristol in 1846, and boys' and girls' reformatories at Kingswood and at the Red Lodge (1852-54), and superintended the last named. She promoted the Industrial Schools Act of 1857, and some of her proposals were adopted in the amended Acts of 1861 and 1866. In 1870 she instituted the National Indian Association, whose journal she edited. Her plan of day-feeding industrial schools in connection with school boards was adopted in 1876. She died 14th June 1877. Besides her reformatory writings she published *Our Convicts* (1864), a book which drew public attention to the treatment of young criminals; *The Last Days of the Rajah Rammohun Roy* (1866); and *Six Months in India* (1868). See *Mary Carpenter*, by J. Estlin Carpenter (1879).

Carpenter, WILLIAM BENJAMIN, biologist, Mary's eldest brother, was born at Exeter, 29th October 1813. He was educated at Bristol, passed some time in the West Indies with the family doctor, then studied medicine at Bristol, London (1833), and Edinburgh (1835-39). His graduation thesis (1839) on the nervous system of inverte-

brate animals led up to his *Principles of General and Comparative Physiology* (1838), one of the earliest works giving a general view of the science of life. Removing to London in 1844, he was appointed Fullerian professor of Physiology at the Royal Institution, lecturer or professor at the London Hospital and University College (1849), examiner at the university of London, and its registrar (1856). He also edited (1847-52) the *British and Foreign Medico-Chirurgical Review*, and a *Popular Cyclopædia of Science* (1848). His death, 19th November 1885, resulted from burns caused by the upsetting of a spirit-lamp. While vice-president of the Royal Society he persuaded it to apply to government for aid in investigations in marine zoology. Three voyages were made to the North Atlantic and Mediterranean by Carpenter and his colleagues. The *Challenger* expedition was a result which sprang from these expeditions. Carpenter made valuable researches on the Foraminifera; on the *Eozoon Canadense*, on feather-stars and crinoids; on the relation between mind and brain. His deep-sea explorations led him to advocate the doctrine of vertical ocean circulation sustained by opposition of temperature only, independent and distinct from the horizontal currents produced by winds. He did a great deal to popularise the use of the microscope by his *Microscope and its Revelations* (1856). Other works are *Principles of Human Physiology* (1846, and many editions); *Principles of Mental Physiology*; *Animal Physiology*; *Manual of Physiology*; *Zoology and Instincts of Animals*; *The Foraminifera*; *Use of Alcoholic Liquors* (1851); *Physiology of Temperance* (1870); *Mesmerism and Spiritualism* (1877); *Nature and Man* (with memoir by J. Estlin Carpenter, 1888).

Carpenter Bee, a name given to various bees which excavate their nests in wood. This is most

Carpenter Bee (*Xylocopa*):

Showing the cells for eggs and larva, excavated in dead wood.

economically performed by those which choose a pithy branch such as bramble and briar. *Ceratina albicollis* carves out a canal about a foot long, divided by partitions of glued pith particles into a series of perhaps a dozen chambers. More than a score of Hymenoptera, including not a few true bees, have a similar habit. Much more laborious is the work of *Xylocopa violacea*, a very large bee with deep violet wings, found in southern and middle Europe. She chooses rotting vine-pros and espaliers, and with her mandibles unwearyingly bites a hole a foot or more in length. The grain of the wood is followed, but the progress is not much over $\frac{1}{4}$ -inch per diem. The tube is divided into a dozen or so chambers by partitions of glued sawdust. Each chamber contains an egg with a store of honey and pollen, and the roof of each cradle forms as it is made the floor of the one above (see BEE). The North American *X. vir-*

ginica exhibits similar habits in great perfection. The common British *Megachale willughbiella* bores in willow-trees. Various species of *Osmia* also burrow. Lazier species sometimes gain possession of old holes.

Carpentras, a town in the French department of Vaucluse, on the Auzon, 17 miles N.E. of Avignon by rail. It was the *Carpentoracte* of the Romans, and a triumphal arch attests their former presence here. Carpentras has besides a cathedral (1405), the stately Porte d'Orange of the 14th century, a massive aqueduct (1734), and manufactures of cottons, woollens, &c. Pop. 10,000.

Carpentry may be described as the art of timbering, or combining and framing together pieces of timber in the construction of ships, bridges (and centering), roofs, scaffolding, &c., while joinery is the art of framing or joining woodwork for the finishing of houses, making doors, windows, stairs, &c. Carpenter work is put together with iron ties, bolts, and nails. Joinery includes all woodwork which can be put together with glue. Carpentry forms a most important branch of the civil engineer's and architect's labours, and many scientific principles are involved in producing the maximum of strength in the construction, with the minimum of weight in the materials employed. Every individual part should bear its due proportion of the strain, not only of its own weight, but of any outside pressure it may be calculated to resist. In America, where timber abounds, many ingenious uses have been made of it in the building of bridges, houses, &c. Iron is now superseding timber in many of its uses. Further information will be found in such articles as BRIDGE, BUILDING, FLOOR, ROOF, SHIPBUILDING, STRENGTH OF MATERIALS, TIMBER, &c. See also R. Scott Burn, *New Guide to Carpentry* (1871); T. Tredgold, *Principles of Carpentry* (7th ed. 1886), and works by Gould, Hatfield, Newlands, Riley (1906), and others.

Carpet-bagger, a term applied after the American civil war of 1861-65 to political adventurers from the northern states who tried to secure the votes of the negroes in the south; and implying that they had no property in the district save the contents of their carpet-bags.

Carpets. A carpet is a textile fabric used for covering floors. Its surface is generally formed of worsted yarn; but silk, goats' hair, and camel-hair are used to a limited extent in Eastern carpets, and cotton and jute carpets are also made. Two classes of carpet are to be distinguished: (1) piled fabrics in which the surface is woven into or knotted on a foundation of other woven fibre, and (2) flat surface textures composed of plain woven warp and weft. Felted fabrics and floorcloths are also used as floor-coverings, but these are not technically regarded as carpets.

The early history of carpets is very obscure, and is confused with that of tapestry. Both fabrics are made by the same processes, the essential distinction being in the use of tapestry for wall-hangings rather than for floor-coverings.

Persian Carpets.—The manufacture of these goes back to a very remote period. Indeed, it appears to be certain that pile carpets were first made in Persia, and from that country introduced into India by the Mohammedan conquerors. The Persian habit of sitting and sleeping on the ground probably brought into use soft floor-coverings suited to such a custom. Even among the higher classes in Persia carpets constitute the whole furniture of a room, except a few ornaments placed in niches in the wall. A Persian not only sits and sleeps upon, but also makes a table of, a carpet. Fine Persian fabrics of this kind are very highly prized for their beautiful and appropriate designs, and for the quiet harmony

of their colours. They are of great durability. Sir Murdoch Smith states that the floor of the chief pavilion of the Chehel Sittu palace at Isfahan is covered with a fine carpet which has been in use since the time of Shah Abbas, who reigned in the end of the 16th century. Persian pile carpets are made by firmly knotting tufts of woollen yarn on the warp threads, and these tufts are held in their place by the woof yarn. Whilst the lower-class carpets may have as few as twelve tufts of pile per square inch, elaborate and costly examples may contain up to four hundred tufts in that space. The richest Persian carpets are made in Kuidistan; but in the districts of Khorassan, Feraghan, and Kermak carpets of great beauty are also produced, each having distinctive qualities both of texture and design. The pile carpets of Persia do not appear to have been brought to Europe earlier than the 14th century; but thereafter they are frequently mentioned in inventories of the possessions of royal and important personages, and are shown in the interiors of early painters. Cardinal Wolsey adorned his Hampton Court Palace with numerous costly Oriental carpets. A carpet with the monogram E.R. and date 1576, in the possession of Lord Veinlam, clearly marks its connection with Queen Elizabeth. In an inventory of property of Marie de Medici are enumerated '*sept tapis de Perse*.'

The manufacture of pile carpets in the Persian style was set up in the Louvre in 1604, and ten years later it was transferred to the Savonnerie. In 1667 Colbert established the Gobelins, which to this day, along with Beauvais, continues to be a state manufactory of carpets and tapestries in the Persian style. In 1751 carpet-making was established by a Frenchman, Parisot, at Fulham, and about the same time the industry was begun at Axminster, whence it spread to Kidderminster and to Halifax. In the later half of the 19th century carpet and tapestry looms were set up by William Morris at Merton, in Surrey; and that constitutes the latest development of the industry in the Persian style.

Indian Carpets.—Both cotton and woollen carpets are made in India. Those composed of cotton are chiefly made in Bengal and Northern India, and

Fig 1.—Carpet Loom, Cawnpore.

are usually in two coloured stripes, such as red and blue. They are often further ornamented with squares and diamond shapes, and occasionally with

gold and silver. Sir George Birdwood, a high authority on the history of Indian manufactures, considers that the patterns upon these cotton carpets, as well as those upon portions of some native dresses, illustrate the most ancient ornamental designs of India. The patterns on the woollen pile carpets of India can be traced back to Persian originals, and both fabrics are made in the same way. Many of the older ones, as well as some quite recently made, are scarcely less remarkable than those made in Persia for their beauty and other meritorious qualities. In numerous parts of India, however, the designs have suffered from European influence. Fig. 1 shows an Indian carpet loom; those used in Persia are equally primitive. Carpets are made in Kashmir, the Punjab, Sind, and on the Malabar coast; also at Agra, Mizapur, Jubbulpore, Hyderabad, Masulipatam, and elsewhere. Some silk and velvet carpets are likewise made in India.

Turkey Carpets.—Like the carpets of Persia, India, and North Africa, these are made on rude simple looms by knotting tufts of woollen yarn on the warp threads across the width of the carpet, and firmly binding the rows of these tufts by the weft. The most characteristic patterns of Turkey carpets are diamond shapes and zigzags; that is, they are more purely geometrical than the Persian designs. The arrangement of the colours usually adopted produces a rich and pleasing effect, and the fabric, from its mode of construction and depth of pile, is extremely durable. Turkey carpets are chiefly made at Ushak, near Smyrna, in Asia Minor.

Kidderminster or Scotch Carpet.—This is the oldest kind of machine-made carpet. It has no pile, the yarn of which it is composed lying flat upon the surface like an ordinary worsted cloth. In some respects, although coarser and stronger, it resembles a woollen damask of two colours, and like it is reversible. The pattern is most perfect on the face side, but if in this position it shows a purple flower on a green ground, then on the other side the flower is green on a purple ground. This would be a two-ply carpet, the purple portion forming a separate layer from the green portion, except at the edges of the flower, where the yarn in passing from the front to the back binds the two layers together. A three-ply is in three layers, and is usually in three or more colours or shades of colour. The different layers are interlocked by the manner in which the threads are used to form the pattern. *Unson Kidder Carpets* resemble the two-ply kind, except that, instead of being all wool, they have cotton warps and worsted wefts. In these the colour of the cotton usually fades before that of the wool. Kidderminster carpeting is woven on power-looms with Jacquard apparatus.

Brussels Carpet.—In this make of carpet the worsted threads are arranged in the warp, and are interwoven into a network of linen. Still the bulk of the carpet consists of wool. What is called a six-frame 'Brussels' consists of six layers or thicknesses of coloured worsted yarn, but there are also five-, four-, and three-frame carpets of this kind, each formed of a corresponding number of worsted

Fig. 2.

threads. Of these the best and thickest is the six-frame variety. The number of colours in the carpet indicates often, but not always, the number of frames used in its construction. These frames are placed behind the loom, and each of them contains about 260 reels or bobbins of worsted,

which as a rule is of one colour, that being the number of threads in a carpet of the usual width of 27 inches. But by a little ingenuity five or six colours can be arranged in a four-frame carpet, in which case only an expert can determine its quality. Brussels carpet is woven on a loom with a Jacquard apparatus (see WEAVING), which raises such of the coloured yarns to the surface as the pattern requires at each throw of the shuttle. These are at the same time formed into loops by the insertion of wires, which are immediately withdrawn. Fig. 2 shows a section of a Brussels carpet in which these wires are shown.

Velvet Pile or Wilton Carpet.—This only differs from a Brussels carpet in having the raised loops cut so as to give it a velvet-like surface.

Tapestry Carpet (fig. 3), the name given to a carpet made of parti-coloured yarns by a very ingenious method patented by Mr Richard Whytock of Edinburgh in 1832. It resembles the 'Brussels' make inasmuch as the surface is formed of loops of worsted yarn, but instead of each thread being of a single colour, it is of several colours in the tapestry carpet. It is really a printed carpet, but it is only the woollen warp yarn, not the woven fabric, which is printed. These yarns are placed on a large drum which is traversed by small rollers charged with dyes, and thus the threads are printed in bands of various widths. When the parti-coloured warp threads are arranged for weaving, the pattern appears long drawn out. In that stage what are to be squares in the woven pattern appear as oblongs, and what are to be circles as ellipses.

Fig. 3.

The weaving draws them up into proper shape, and the looms are simple. Although the back of a tapestry carpet may be of any vegetable fibre, it is very frequently of jute, but the wool is practically all on the surface. In a Brussels carpet, on the contrary, the worsted yarns are not only on the surface, but in layers below it.

Carpets of undyed worsted yarn are made of a similar structure to the tapestry kind, and afterwards printed with a pattern on the surface.

Patent Axminster Carpet (fig. 4).—Mr J. Templeton of Glasgow patented in 1839 a method of making carpets by the use of chenille which are known by this name. The wool chenille is first woven on a separate loom, and cut into strips for the weft. In this kind of carpet the elements of the design or pattern exist in the chenille weft, which somewhat

Fig. 4.

resembles the parti-coloured warp yarn in the tapestry carpet; but this chenille, having a pile to begin with, does not require to be formed into loops. The surface of the carpet is in fact formed of weft lines of chenille, which, so to speak, has a backbone of thread. By means of 'catcher warps' crossing its backbone, the chenille is bound to a strong under-fabric of cotton, linen, or hemp.

Royal Axminster Carpet.—In 1878 a power-loom from America was introduced into Great Britain which quickly produced a marked influence on the carpet industry. Known in the United States and in France as the Moquette loom, it is a most

ingenious but complex machine. The carpet it makes differs from Templeton's patent Axminster in not requiring the preliminary weaving of the chenille, and from 'Brussels' in not requiring the use of Jacquard apparatus to weave it. In the Royal Axminster the pattern is arranged line by line on a succession of small spools of yarn, from which tufts are cut by machinery and fastened into the carpet by the interlacing of linen or jute warp and weft.

Jute Carpets.—Owing to the fact that jute is neither a very durable fibre nor easily dyed with permanent colours, carpets made of it are not highly esteemed, but they are much cheaper than other kinds. They are made (at Dundee on a very large scale) either with a looped or plain surface, and their patterns may be as beautiful as any on Brussels or Kidderminster carpet.

Seats of the Industry.—Whilst carpet-factories are widely distributed throughout civilised nations, the United Kingdom remains the principal centre of the industry. In England the leading seats are at Kidderminster and Halifax; but great factories exist also at Dewsbury and other Yorkshire towns, as well as at Stourbridge and Durham. In Scotland rich and costly patent and Royal Axminsters are made in Glasgow; the Esk Valley, near Edinburgh, and Elderslie, near Paisley, are homes of the tapestry carpet manufacture; whilst in various forms the industry flourishes at Kilmarnock, Darvel, Bannockburn, and Aberdeen. In the United States carpets are manufactured extensively at Philadelphia, Lowell (Mass.), and elsewhere.

Merits and Defects of Carpets.—The Royal Axminster has in these days quite superseded the Brussels carpet in public favour. Both it and the tapestry kind let less dust through them than a Kidderminster does. The latter, though an excellent fabric when well made, wears much sooner than either of the other two kinds to the extent of disfiguring the pattern on one side—that is, unless the tapestry carpet is of poor quality. The advantage of getting wear out of two sides does not bring a Kidderminster up to an Axminster or a Brussels in point of durability, but a Kidderminster is better in this respect than a fair quality of tapestry carpet. The patent Axminster carpet is very durable when it has a deepish pile; but if not carefully handled, a strip of its chenille gets loose, and this is a little difficult to repair. Carpets of graded sizes woven in one piece have within recent years come into public favour under the name of 'parquet carpets,' 'art squares,' or 'seamless carpets.'

The so-called Holy Carpet, sent annually from Cairo to Mecca with solemnities, is really a silk covering for the Kaaba. See MECCA.

Carpi, a town of Italy, 10 miles N. of Modena, with a cathedral (pop. 8000); also a village 28 miles SE. of Verona, celebrated for the victory obtained here by Prince Eugene over the French in 1701.

Carpini, or JOHANNES DE PLAN DEL CARPINE, a Franciscan monk, born in Umbria about 1182; was head of the mission sent by Pope Innocent IV. to the court of the emperor of the Mongols, whose warlike advances had thrown Christendom into consternation. A big, fat man, more than sixty years old, he started from Lyons in April 1245, and, crossing the Dnieper, Don, Volga, Ural, and Jaxartes, in the summer of 1246 reached Karakorum, beyond Lake Baikal, thence returning to Kieff in June 1247, and so back to Lyons. The hardships of the journey were great, and one ride of 3000 miles in 106 days surpasses the best records of most modern travellers. Prior to this, the most monstrous fables had prevailed regarding the Tartars; and Carpini's Latin narrative was the

first to bring these myths into discredit. Hakluyt copied much of the work into his *Navigations and Discoveries* (1598); but the first complete edition of the text was D'Arve's (1839). Carpini died Archbishop of Antivari some time before 1253.

Carpo'crates OF ALEXANDRIA flourished in the first decades of the 2d century A.D., and founded the Gnostic sect of Carpo'cratians. According to him, the essence of true religion consisted in the union of the soul with the Monas or highest God, by means of contemplation, which elevated it above the superstitions of the popular faith, and liberated it from the necessity of submitting to the common laws of society. Among those who have attained to this are Jesus, Pythagoras, Plato, and Aristotle. Matter being regarded as the principle of evil, the soul had no obligations in regard to it, and the true rule of life was to cultivate an entire indifference to it, and simply follow one's own impulses. All life being an effluence from or a return to God, limitation or sin cleaves to all individual life as such. The soul's return to God is theoretically through the knowledge of the divine unity, and practically through a life that follows nature and overleaps all limits laid down for it by laws—e.g. the law of private property and the law of marriage, which were only instituted by the angels who made the worlds. The soul that attains to this freedom receives miraculous power; until it reaches it, it is held down by the world-makes in metempsychosis, remaining in the prison of bodily life until it has 'paid the uttermost farthing.' The Carpo'cratians existed down to the 6th century. See GnosticISM.

Carpolites, the fossil fruits of certain Carboniferous trees. Some of these are heart-shaped bodies (*Cardiocarpon*); others are ellipsoidal, and usually three-angled (*Trigonocarpon*); and yet others are ellipsoidal, with a wrinkled and finely granulated surface (*Rhabdocarpon*).

Carpophore. In the fruit of geraniums and Umbellifereæ the ripe carpels split away from the central axis from below upwards, but remain attached at top; hence in technical phraseology they are said to be suspended from a *carpophore*. See UMBELLIFEREÆ, GERANIACEÆ.

Carpus, Carpal Bones. See HAND, FOOT, SKELETON.

Carpov, the name of a learned family, of which the most conspicuous members were BENEDICT (1595–1666), an important writer on law, who held high offices at Dresden and Leipzig; and his brother JOHANN BENEDICT (1607–57), professor of Theology at Leipzig, who published his *Systema Theologicum* in 1653.

Carracci. See CARACCI.

Car'rageen, often incorrectly called CARRAGEEN MOSS, or IRISH MOSS, the Irish name of *Chondrus crispus*, and some other allied species of seaweeds, long of local importance as an article of food, but now widely diffused, especially in invalid cookery. The true carrageen is *Chondrus crispus* (order Florideæ, family Gigartineæ; see SEA-WEEDS), and it occurs commonly on rocky shores, particularly in North Europe, presenting many local varieties. Its congener, *Gigartina* (*Chondrus*) *mammillosa*, most frequently accompanies it. It is 2, 4, 6, or even sometimes as much as 12 inches long, branched by repeated forking, tough and flexible, and of variable colour; from yellowish green through shades of red to purple being most frequent. After being collected and washed in fresh water, it is bleached and dried in the open air; and is then white or yellowish, dry, shrunken, horny, and translucent. When treated for ten minutes with cold water, in the proportion of half

an ounce of carrageen to three pints of water, and then boiled and strained, it yields, with or without spices, a pleasant drink. With a larger proportion of carrageen, a thickish liquid or *mucilage* is obtained; and on boiling down this strong decoction, and cooling, a stiff *jelly* is procured. Milk

Carrageen (*Chondrus crispus*):
A, B, C, different forms of growth.

may be employed instead of water; and with the stronger preparation, along with sugar and spices, when thrown into a mould, a kind of *blanc mange* is obtained. It is much recommended in pulmonary consumption and other maladies, but its value seems to depend on its being a pleasant and digestible article of food; even its nutritive importance has, however, been greatly exaggerated; especially when we consider that a pound of stiff jelly contains only half an ounce of the dried weed! It is sometimes employed for feeding cattle, in the preparation of size by painters and calico-printers, in stuffing mattresses, and for other uses. The 'Ceylon Moss,' in similar use in the East, is *Sphaerococcus lichenoides*, another seaweed of the same order (Florideæ), and is of similar properties and uses. 'Iceland Moss' (q.v.), however, is a lichen, *Cetraria islandica*.

Carranza, BARTHOLOMÆUS DE, born in 1503, at Miranda, in Navarre, entered the Dominican order, became professor of Theology at Valladolid, and in 1554 accompanied Philip II. to England, where he was confessor to Queen Mary, and where his zealous efforts to re-establish Catholicism gained him the confidence of Philip and the archbishopric of Toledo, the richest in Spain. Here, however, he was accused of heresy, and imprisoned by the Inquisition in 1559. In 1567 he was removed to Rome, and confined in the castle of St Angelo. He died a few days after his release, 2d May 1576.

Carrara, a town of Northern Italy, 30 miles NW. of Leghorn by rail. It is situated on the Avenza, near its mouth in the Mediterranean, and is surrounded by the marble hills which have made its celebrity. The town and its inhabitants are wholly given up to the marble trade. There are above 400 marble-quarries, larger or smaller, in the vicinity of the town, though very few furnish the marble used for statuary. The marble is a white saccharoid limestone, which derives its value to the sculptor from its texture and purity. It was formerly supposed to be of Archæan age, but is now known to be a metamorphosed Jurassic limestone. The quarries are on the side of the mountains, a branch of the Apennines, at heights varying from 500 to 3500 feet.

The mountains furnish, happily, an abundant supply of marble; for in two thousand years much has been wasted by primitive methods of quarrying. Besides the quarrymen, the marble employs many marble-cutters in the town, together with tombstone and other statuary of the humbler kinds, as well as sculptors. Similar marble is quarried at Massa and elsewhere. Pop. 40,000.

Carrara, or CARRARESI, a family which ruled Padua in the 14th century, named from the neighbouring village of Carrara.

Carrel, ALEXIS, French-American surgeon, born 28th June 1873 at Lyons, studied there, and was professor of the faculty of medicine. He went to America in 1905, and became a member of the Rockefeller Institute in New York. He succeeded in keeping organs alive long after removal from the body, and applied his method to transplantation in surgery.

Carrel, ARMAND, a celebrated French publicist and republican leader, was born at Rouen in 1800, and was educated in the military school of St Cyr. After serving for some years in the army, he went to Paris, and devoted his attention to political and historical studies. In 1830, in connection with Thiers and Mignet, he became editor of the *National*, the ablest and most spirited of the journals opposed to the government of Charles X. Carrel's colleagues being employed by the new government of Louis-Philippe, he was left to conduct the *National* himself, which he did with a spirit and a freedom such as had not been witnessed in France for a long time. On more than one occasion he checked the arbitrary power which the government attempted to exercise, and gained the high admiration and esteem of the popular party. Government prosecutions of course followed his outspokenness, and heavy fines were decreed against him; but these were paid by public subscription, and each conviction only made his journal more famous. Carrel, however, decried revolution as much as he hated despotism, and had no sympathy with many of those who looked up to him as a leader. Provoked into a duel with Emile de Girardin, by an attack on his personal character, Carrel was mortally wounded, and died 24th July 1836. Littré and Paulin edited his *Œuvres Politiques et Littéraires* (5 vols. 1857-58).

Carriage is a general name for any vehicle intended for the conveyance of passengers either on roads or railways. Carriages are structures mounted on two or more wheels, and in form, build, and accommodation they are exceedingly diverse. The origin of the term is of course the same as *carry*, late Lat. *caricare*, to convey in a cart; *carr-us*, 'a car,' a word of Celtic origin. The earliest carriages were probably constructed for warlike purposes; but at a period so remote as the time of Joseph, carriages were used also at least for royal pageants (Gen. xli. 43). Among the Greeks, chariot-races formed an important feature in the Olympic games; the Romans had two, three, and four horse chariots; and according to Herodotus the Scythians had a covered chariot, the top of which was removable, and capable of being used as a tent. Of the carriage of modern times, the earliest record belongs to about the year 1280, when Charles of Anjou entered Naples, and his queen rode in a *caretta*, a small decorated car, the parent of the modern chariot or chariette. Soon thereafter, in 1294, Philip of France issued an edict prohibiting the wives of citizens from using cars or chars, and later, Pius IV. (1559-66) exhorted his ecclesiastics to discountenance the womanly fashion of riding in coaches.

The first carriage ever seen in England—apart from the war-chariots of the early Britons—was

made in 1555 by Walter Rippon for the Earl of Rutland, and subsequently the same coach-builder made one for Queen Mary. These cannot have been very successful vehicles, for Taylor, the Water-poet, a determined enemy of the innovation, says: 'The first ever seen here was brought out of the Netherlands by one William Boonen, a Dutchman, who gave a coach to Queen Elizabeth, for she had been seven years a queen before she had any coach.' Later in the reign, the royal carriages had sliding panels, so that the queen could show herself to her loving subjects whenever she desired. During the closing years of Elizabeth's reign, and early in the 17th century, the use of pleasure-carriages extended rapidly in England. The coaches had first to struggle against the opposition of the boatmen on the rivers, and then against that of the sedan owners and bearers; but they gradually came into very general use.

These early vehicles were at best heavy and lumbering structures, without the springs and other mechanical adaptations which make a modern carriage a triumph of constructive art; and as they rumbled over the wretched roads, travelling in them must have been far from luxurious. The condition of the roads necessitated great strength and solidity in the vehicles; and improvements in carriage-building were of necessity preceded by improvement in the art of road-making. The suspending of the coach body by leathern straps, to insure ease of motion and freedom from violent jerks, was an amelioration introduced early in the 18th century. Subsequently these straps were attached to C-springs—an arrangement used to the present day in coaches proper. The elliptic spring on which most carriages are now mounted was invented in 1804 by Mr Obadiah Elliot, and since that time the improvements in carriages have been very numerous.

It would serve no useful purpose to enumerate the principal varieties of carriages, many of which are peculiar to particular countries, and are known by local names. Among the numerous ways in which road-carriages vary, the most important are the number of wheels, the method of entering, and the seating of the vehicle, the nature of the covering when the carriage is inclosed or partially inclosed, the number of persons it is designed to accommodate, and the arrangements for horsing. Road-carriages have either two or four wheels; examples of two-wheeled vehicles being the common gig, the Tilbury, the dog-cart, the T-cart, the Irish car, and the hansom-cab. Such vehicles require a pair of rigid shafts, because the load must be divided between the wheels and the back of the horse. In four-wheeled vehicles the horse or horses have only a dragging load, and the animal or animals may be yoked either between hinged shafts or by leathern traces alone, or by traces and a central splinter-bar. Examples of open four-wheel carriages are the Phaeton, the Wagonette, and the Brake. Partly-covered carriages are the Droskey or Droitska, the Victoria, and the Barouche. The Landau is the type of a carriage which at will can be entirely closed like the coach, or quite open by folding the covering flat back to both sides. The Coach is a permanently inclosed carriage, as is also the Brougham, which is only a miniature coach. The Mail-coach or Drag, like the Omnibus, has both outside and inside accommodation for passengers.

The manufacture of carriages, whether pleasure-vehicles or omnibuses, ranks in the highest class of mechanical labour. There is a necessity for the best materials and the best workmanship, since, owing to the severe strains and jerks to which the vehicles are subject, cheap construction is in the

end unprofitable. Many different kinds of wood are employed in the construction. The body of the carriage is made by one set of workmen, the under-framing by another; the former partaking more than the latter of the nature of cabinet-work. The steel-spring making is delicate work, owing to the necessity for combining strength with lightness and elasticity; and the various pieces of ironwork require careful adjustment, especially the axles. The covering of the upper part of the body of a carriage with leather is one of the most difficult parts of the manufacture; one single hide is employed, the leather being worked round the corners by repeated currying while wet; and all must be rendered smooth, without even a puncture. The best coaches receive as many as twenty to thirty coats of oil-paint; and the polishing processes are numerous and carefully conducted. The carving, gilding, herald-painting, lace and fringe work, metal ornamentation, &c., are among the best examples of their respective handicrafts. See CAB, COACHING; Thrupp's *History of Coaches* (1877), and other works by Ware (Phil. 1875), Stratton (1878), and J. W. Burgess (1881).

Carriage Dog. See DALMATIAN DOG.

Carrick, the southern division of Ayrshire (q.v.). The Prince of Wales is Earl of Carrick.

Carrickfergus, an Irish seaport town and urban county district, situated on the north side of Belfast Lough, on the south-eastern border of County Antrim, $9\frac{1}{2}$ miles N. of Belfast and 12 miles S. of Larne by rail. Its chief feature is its picturesque castle, supposed to have been erected by De Courcy in the 12th century. It stands on a rock about 30 feet high, projecting boldly into the sea. But one gateway now remains of the ancient city walls. Here William III. landed seventeen days before the battle of the Boyne, and here Thurot made an abortive landing in 1760. Flax-spinning is carried on, and there is an oyster-fishery. Till 1898 the town of Carrickfergus was a county in itself, and in 1885 it ceased to be a parliamentary borough. Pop. 4000.

Carrick-on-Shannon, the capital of County Leitrim, on the Shannon, 98 miles NW. of Dublin by rail; pop. 1000.

Carrick-on-Suir, a town of Tipperary, situated on the Suir, which is navigable at this point, 14 miles E. of Clonmel, and 149 miles SW. of Dublin by rail. It has woollen, linen and flax factories, and a good trade in agricultural produce, and there are slate-quarries in the neighbourhood. There are the remains of a castle built in 1309, and belonging to the Butler family, a branch of which hence received the title of Viscount and Earl of Carrick. A stone bridge connects it with the suburb of Carrickbeg in County Waterford, which has an abbey (1386). Pop. (1851) 7512; (1881) 6583; (1911) 5235.

Carrier, JEAN BAPTISTE, an infamous member of the French National Convention, was born at the village of Yolai, near Aurillac, in Auvergne, in 1756. Entering the National Convention in 1792, he took an active part in the formation of the Revolutionary Tribunal, voted for the death of the king, demanded the arrest of the Duke of Orleans, and assisted in the overthrow of the Girondists. At Nantes, whither he was sent on a mission against the moderates in 1793, he found ample means for indulging his insatiable thirst for human blood. The utter defeat of the Vendéans had filled the prisons with captives, and Carrier proposed and carried a resolution for murdering the unhappy prisoners *en masse*. Accordingly, he compelled ninety-four priests to embark in a vessel, under pretence of deportation, and during the night drowned

the whole of them, by having the ship scuttled. Such summary executions, called *noyades*, also 'vertical deportations,' were repeated to the number of twenty-five. Men and women also were tied together feet and hands, and thrown into the Loire; and this was called *mariage républicain* (republican marriage). The water of the Loire was so poisoned by corpses, that its use for drinking and cooking was prohibited. Five hundred political prisoners were shot, as in a battue, on the bridge near Nantes. In those massacres the form of trial was discontinued; and in four months 16,000 persons perished. Even Robespierre was offended by the enormities committed, and recalled Carrier, who boldly justified his own conduct before the Convention. The fall of Robespierre was, however, soon followed by outcries against Carrier; judgment was decreed against him, and he perished under the guillotine, 16th December 1794.

Carrier, MORIZ, a German philosopher and many-sided man of letters, born at Griedel, in Hesse, 5th March 1817, studied at Giessen, Göttingen, and Berlin, and in 1853 became professor of Philosophy at Munich. He is one of the founders of the modern school of thought which endeavours to reconcile Deism and Pantheism. His *Aesthetik* and other works on Aesthetics (qv) have been widely read in Germany; and his important work, *Die Kunst im Zusammenhang der Kultur-entwicklung und die Ideale der Menschheit* (5 vols. 1863-74), attained great popularity. He also published *Die sittliche Weltordnung* (1877), a thoughtful monograph on Cromwell, several volumes of verse, &c. He died 19th January 1895. His *Gesammelte Werke* (14 vols.) appeared in 1886-94.

Carrier Pigeon, a fancy variety of domestic pigeon; large in size, long in body and neck, bred in several different colours, and very remarkable in appearance from the great length of head and beak and enormous excrescences of white carunculated skin, called wattle, at the base of the beak and round the eyes. According to Darwin, the carrier is undoubtedly of Eastern origin, and is probably a descendant of the Persian messenger pigeon. It is stated in Moore's *Columbarium* (1735) that the carrier was first imported from Persia into Europe by Dutch sailors, 'being sometimes brought by shipping and sometimes in the caravans.' The striking appearance of the English carrier of to-day is due to the careful breeding of English pigeon-fanciers, and existed only to a very modified extent in the original imported bird. The Eastern carrier was probably very similar in appearance to the present 'dragon' pigeon, or to the formerly well-known 'horseman.' A good English show carrier should have a length of face of fully two inches, measured from the centre of the eye to the extremity of the beak. A stout box-beak is much esteemed, and the fineness of texture of the wattle is also an important property. From £50 to £100 has been paid for an exceptional bird—i.e. one good enough to take prizes in some of the many pigeon shows of this country. Having been bred for more than two centuries as a purely fancy variety, for show points alone, and its flying properties having been neglected, the English carrier has long since lost the attributes that gave it its name.

Moore states in his *Columbarium* that 'those who are possessed of true carriers, which are at present very scarce here, pay too dear, and have too great a value for them to risk their being lost' as letter-carriers. Like all highly developed fancy breeds, they are often delicate, and most of them are deficient in the strength, the intelligence, and the vigorous constitution necessary in a messenger bird. It is a common error to speak of the birds employed as messengers as 'carrier pigeons.' The

pigeons now made use of for long-distance flying and as message-bearers are called homers, or homing Antwerps, and are very different in appearance from 'carriers.' They are of medium

A, English Show Carrier Pigeon; B, Homer or Messenger Pigeon.

size, somewhat similar to the common pigeon in appearance, but heavier, stronger, and have larger heads.

The modern homer is a direct descendant of the pigeon voyageur of Belgium. The voyageur is a composite breed, resulting from a cross between the common thin-beaked blue rock (*Columba livia*), the short-faced intelligent owl-pigeon, or smerle, the strong, determined, long-faced dragon, and the high-flying Antwerp cumulet, or other tumbler pigeon. The breed is now well established, and may be said to be of a general uniform type. From £40 to £50 has been paid for a good homer, a winner in a 500 miles race, but such a price is very exceptional. To insure the return of a homing pigeon that has been liberated far away from its home, a previous course of training is necessary. This is usually commenced in July, when the young birds are three or four months old. Those selected for training are placed in a basket, transported a short distance from home, and then liberated. These distances are successively increased in the same direction until the required stage has been reached. The following are the usual training stages, in miles from home: 1, 3, 6, 12, 21, 35, 50, 75, 100. There should be an interval of a few days between the tosses. Old birds may be 'jumped' farther than young ones. At three years of age 500 miles may be flown. Stages after 100 miles would be about as follows: 100, 150, 225, 325, 450 miles. These long distances are accomplished only by the very best birds. A large percentage of birds are always lost in training. Pigeon-racing is conducted through the medium of pigeon-flying societies or clubs. In England there are several such clubs. In Belgium, France, Germany, and Italy they are very numerous. Every bird competing in a race is stamped with a mark unknown to the owner until the bird is caught on his return home. About 800 yards per minute is an average velocity. The highest authenticated velocity is 2200 yards per minute, in a race of 150 miles. The greatest distance flown is 1100 miles, in America.

The nature of the faculty by the exercise of which homing pigeons are able to find their way back to their far-distant homes has been much discussed by ornithologists. It is probable that sight and memory are supplemented by the effect of training always in the same direction, and that the bird may be assisted by the position of the sun, and the directions of warm or cold winds. Pigeons are frequently jumped 250 miles—i.e. after they have flown home from a place 200 miles away, their next toss may be 450 miles. At a height of 430 feet, a moderate height for a pigeon, the range of view on level ground is 25 miles. There are many instances of the early employment of pigeons for

transmitting intelligence. The use of the dove by Noah suggests a knowledge of the bird's habits. It is recorded that pigeons were used as message-bearers by the early navigators of Egypt, of Cyprus, and of Candia, and by the Romans in connection with the Olympic games. Their first employment in war appears to have been at the siege of Modena, 43 B.C. About the middle of the 12th century a regular system of pigeon communication was organised between Bagdad and all the important towns of Syria, and was afterwards extended to Egypt. Pigeon-flying is still in vogue in Asiatic countries where telegraphs do not exist. Further instances of the use of pigeons as war-messengers are the sieges of Haarlem (1572), Leyden (1574), Ladysmith (1899-1900), and Przemyśl (1914-15), and by the Chinese at the beginning of the 14th century.

Much prominence was given to the pigeon-post during the siege of Paris (1870-71). No birds had been sent out of the French capital previous to the arrival of the besiegers. Every pigeon that flew into Paris with messages had been previously sent out by balloon. Of 363 birds which were thus sent out over the heads of the Germans, 302 were liberated, but only 73 reached the capital. As some performed the journey several times, only 57 different birds succeeded in accomplishing the task. The pigeons were collected at Tours and afterwards at Poitiers, but were liberated with their messages at the farthest point north that could be safely reached.

By the use of microscopic photography an enormous number of messages could be sent. By first printing the messages, then photographing them on a thin film or pellicle of collodion about $1\frac{1}{2}$ inches by 2 inches, each film could contain 2500 despatches of twenty words each. One bird could carry at least a dozen of these, making 30,000 despatches. A pigeon that arrived in Paris on the 3d February carried 18 pellicles containing 40,000 messages. The pellicles were rolled up and inserted in a goose-quill about $1\frac{1}{2}$ inches long, which was attached by a silk thread or thin wire along the upper surface of one of the tail-feathers. The weight of the messages was always less than 1 gramme ($15\frac{1}{2}$ grains). Pigeons will, however, carry 100 grains with ease, and for short distances have carried $\frac{1}{2}$ of an ounce (360 grains). The organisation of regular 'military pigeon systems' in almost every continental nation of Europe soon followed the Franco-German war. In France, Germany, Italy, and Denmark great encouragement is given by the state to private societies that fly their birds in directions fixed by the war ministers. England, on the outbreak of war in 1914, took measures to prevent the use of pigeons for communication with the enemy.

During the first half of the nineteenth century pigeons were extensively employed for the conveyance of intelligence, but up to 1830 their use was almost confined, in England, to publicans and prize-fighters. A little later, however, they became generally used by newspaper reporters, and secretly for stockbroking purposes. The first English loft established by a stockbroker was at Dover in 1834, and two years later, there were three lofts at Dover, containing a total of 600 birds, employed by London stockbrokers and by the custom-house authorities. Birds were also kept at Folkestone for similar purposes. There were lofts at Boulogne, and others between Dover and London. Four pigeons were often used to carry a message from a few miles south of Boulogne to London, a distance of 135 miles. In summer time the message carried by the pigeon would arrive in London by mid-day, whereas the Paris mail could not be expected before midnight. Large fortunes were made on the stock exchange by this means. Before the introduction of railways, the difficulties of training the birds

were very great, and 80 miles was the farthest distance flown by a pigeon in England. The Belgians were the pioneers of modern long-distance flying. According to Dr Chapins, their first pigeon-race was in 1818, when 100 miles was accomplished. In 1820 a pigeon flew from Paris to Liège, about 200 miles, and in 1823 the first race from London to Belgium took place. In 1830, 110 pigeons flew a race from London to Antwerp, the winning bird accomplishing the journey of 180 miles in 5 hours and 5 minutes. The Belgian birds, up to this date, were shorter in face and smaller than those used for flying in England. They were faster on the wing, but not so reliable in bad weather. The present pigeon voyageur dates from about 1835, when the Belgian birds were first crossed with the larger and stronger English flyers. By the strict application of the principle of the survival of the fittest, and by breeding only from birds that have proved themselves good workers, the breed of homing pigeons has continued to improve up to the present day. Belgium is still the chief pigeon-flying country of the world. Every village has a 'Société Colombophile.' Races take place chiefly from the south-west of France, and are generally flown on Sundays. During the summer months, special trains, loaded entirely with pigeons, leave Brussels every Saturday. In the annual 'Concours National' of 500 miles over 3000 pigeons often compete. In favourable weather this distance is accomplished in one day. In foggy weather many birds are lost.

Carriers are those who undertake the carrying of goods from place to place by land and sea. In many parts of the East, carrying is done mainly by camels, in South America by llamas, in various parts of Europe by mules and pack-horses (see CAMEL). In England and Scotland, after the pack-horse came the one-horse cart and the four-wheeled wagon, which until the opening of canals, and especially of railways, was the universal means of land-conveyance, and the carrying-trade became by degrees an immense organisation. Canals largely superseded wagons towards the end of the 18th century (see CANALS); and railways soon reduced canals to a very humble share in the business of carrying, even for such goods as minerals, coal, bricks, manure, and the like bulky goods of no great value. Railways still imply a vast amount of work for horses, wagons, carts, lorries, and men in bringing goods from the senders to the trains, and in delivering them to the consignees on their arrival at the nearest railway station. Even when the railways undertake the whole business of receiving and delivering the goods, they frequently employ the men and horses of companies quite independent of themselves. The name of Pickford was famous before the days of railways, and is famous still. At the present time, the tendency is for the companies to take the responsibility of the whole conveyance, the carriers acting as their agents, if willing so to do, or else endeavouring to maintain a fair competition. The goods-vans traversing the streets of the metropolis and other great towns are now more frequently inscribed with the names of railway companies than with those of private carriers. There are parcels delivery companies, and special developments of carrying, such as vans for removing furniture, which are themselves transported by rail. The introduction of the Parcel Post system (1883) has in some respects revolutionised the carrying-trade in Britain. In America the carrying-trade is largely in the hands of separate organisations, the Express Companies, who have special arrangements with the railways, and take all responsibility. Such Companies sometimes have the goods-traffic of a railway in their hands.

In Law, a common carrier is one who offers to the public to convey goods from one place to another for hire. The offer must be general—for a private person who contracts with another for carriage is not a carrier in the legal sense, and does not incur the peculiar responsibilities which, in almost every country, it has been found expedient to attach to the occupation of a public or *common* carrier. Carriage, in law, is thus a peculiar modification of the contract of hiring. The contract may be express, depending on the terms of any agreement permitted by law, or implied from the status of a common carrier who has received goods of the kind which he professes to carry. Such goods he is not entitled to refuse unless they are dangerous, or unless he has no room for them in his conveyance, or unless they are not brought in time for packing, or delivered in a state insecure and unfit for carriage. The vehicle must be sufficient for safe carriage, and the carrier is bound properly to pack. The regular course of the journey must be followed, and perishable goods must be forwarded with reasonable speed. The carrier should give notice, when receiving the goods, of any known unusual cause of delay. In Rome the responsibilities of carriers by water were regulated by a praetorian edict, which was applicable also to innkeepers and stablers; and from that edict the law of carriage in modern Europe has been mainly borrowed, sometimes directly, as in Scotland; sometimes indirectly, as in England. The ground on which the edict increased the responsibilities attaching to an ordinary contract of hiring was that the persons whom it enumerated were under peculiar temptations to consort, either personally or through their servants, with thieves or robbers, without the connection being such as to admit of proof. This responsibility in our own law extends not only to the acts of the carrier's servants, but also to those of the guests of an inn or the passengers in a conveyance. The only exception to this liability at common law is in the case of loss arising from the Act of God (q.v.) or the King's enemies—i.e. the fury of the elements, or war. Neither robbery nor theft is regarded as an inevitable accident. A common carrier is, in fact, at common law regarded as an insurer of the goods.

But there are several limitations imposed by the Carriers Act, 1830, and the Railway and Canal Traffic Acts, 1854 to 1913. The liability for gold and silver, and articles of unusual value, is restricted to £10, unless at the time of delivery the nature and value of the parcel are declared and an increased rate of charge paid; and the proof of value is laid on the person claiming compensation. On the other hand, it is provided that railway and canal companies shall be liable for neglect or default in the carriage of goods, animals, &c., notwithstanding any notice or condition or declaration made by the company for the purpose of limiting their liability. But the statutes permit 'just and reasonable' conditions to be imposed by special written contracts signed by or on behalf of the consignor. A specimen of what is regarded as a reasonable condition is that the company shall not be liable for loss in the case of goods which are improperly packed. The Act of 1856 also compels the companies to give fair all-round facilities as regards transit and through rates, and not to give undue preference to particular traders. As regards carriers by sea, under the Merchant Shipping Acts, 1904 and 1906, the owner or charterer of a British sea-going ship is not liable for loss or damage, occurring without his fault, to goods on board by reason of fire, or to gold, silver, watches, or precious stones by robbery, unless the nature and value of the articles have been declared in writing. Further, where loss or damage to goods occurs without the actual fault of the shipowner, he is not liable to an aggregate amount exceeding £8 per ton on the tonnage of the ship.

A railway company is a common carrier of goods (including live animals) and of the personal luggage of passengers; but it is not a common carrier of its passengers. Hence its obligation simply is to carry passengers with due care, and it is not liable for injuries to them unless negligence is proved. For the functions of the Railway Commissioners, and for the conveyance of passengers, see RAILWAYS.

Under carrier are included carters and porters who offer themselves for hire to carry goods from one part of a city to another. Wharfingers and warehousemen are liable only under the special contracts into which they may have entered, or in accordance with mercantile usage. Carriers on land are liable to make good to the owners of goods entrusted to them all losses arising from accidental fire. There are special statutory provisions as to the carriage of petroleum and dangerous explosives. Carriers have a lien upon the goods they have carried for payment of the carriage only. The lien is, however, restricted to the particular goods to which the carriage refers, and ceases on possession of them having been given up. It does not cover any other account or balance due either by the sender or consignee to the carrier.

In the United States a 'private' carrier, who carries for hire, but is not a common carrier, is, like other bailees for hire, liable only for the exercise of ordinary diligence. The liability of common carriers by land or water in the United States is at common law the same as in England. A contract qualifying this common law liability may be established by framing a notice, brought to the knowledge of, and assented to by, the owner of the goods or his agent, whereby the carrier stipulates for a qualified liability; but a carrier cannot contract out of liability for his own negligence or the negligence of his servants and agents. The rule as to passenger carriers is, as in England, that they are not responsible as insurers of the safety of the passengers as common carriers of goods are, but are liable only for injuries resulting from negligence. The Inter-state Commerce Act of Congress of February 4, 1887, prohibits common carriers from discriminating, in the transportation of passengers or property, between persons or places, and lays down much the same rules as regards undue preference and equal facilities as the British Act of 1856. It also prohibits charges which are not just and reasonable. It compels common carriers to print and make public 'the rates, fares, and charges for transportation of passengers and property,' and forbids combinations among common carriers to prevent the carriage of freights from being continuous from place of shipment to destination.

This act, which has been amended by a long series of more recent acts, created an Inter-state Commerce Commission, a special administrative and semi-judicial tribunal to investigate tariff rates and regulations, and to carry out the purposes of the act. By act of June 29, 1906, this commission was increased to seven members, with terms of seven years. It has exclusive jurisdiction to determine the reasonableness and legality of rates and regulations, and, since 1906, has power to prescribe reasonable rates for rates found to be improper. The commission is a body corporate, and is capable of being a party in a suit in the federal courts. The Commerce Court, created in 1905, has been abolished by act of October 22, 1913, and its jurisdiction transferred to the district court, with an appeal to the Supreme Court. Common carriers, under these acts, are still entitled, as at common law, to make special contracts, to classify their tariff, and to adjust and apportion their rates, but their powers are exercised subject to the conditions that the charges shall not be unreasonable, and shall not unjustly discriminate so as to give undue

preferences. The term common carrier, as used in the Inter-state Commerce Act and its amending acts, has a very extensive application, including, e.g., express and sleeping-car companies, telegraph, telephone, and cable companies, and oil-pipe lines.

Carrion Crow. See CROW. The name is sometimes applied in America to a species of vulture. See VULTURE.

Carrion Flowers, a name which, on account of their smell resembling that of putrid meat, has been given to the flowers of many species of *Stapelia*, a genus of Asclepiadæ, which is otherwise remarkable for the succulent development of the cellular tissue of the stem and reduction of the leaves, resulting in a general aspect like that of

Carrion Flower (*Stapelia variegata*).

the Cactus family. There are about 100 species, all natives of South Africa. The flowers are often large and marked in dirty red and yellow, and the stench is very strong. They attract short-tongued carrion flies, and by these visitors cross-fertilisation is effected. *Ceropegia* is similar, as are, in other orders, *Rafflesia*, *Aristolochia*, *Arum*, *Heliconias*, &c. Some temporarily imprison the fly until the pollen is mature.

Carroll, CHARLES (1732-1832), American revolutionary patriot, was a man of large property in Maryland, being accounted the richest man in all the colonies. He was the last survivor of those who signed the Declaration of Independence.

Carroll, LEWIS. See DODGSON, CHARLES.

Carrollton, since 1873 a northern section of New Orleans (q.v.).

Carron, a village in Stirlingshire, on the right bank of the river Carron, 2 miles NNW. of Falkirk. Its great ironworks, established in 1760, and employing 3000 men, till 1852 produced 'carronades' and other guns, and now turn out stoves, grates, boilers, pipes, &c.

Carronades were short cast-iron guns, of all calibres from 6-pounders to 68-pounders, invented in 1752 by General Robert Melville, and first made by Mr Gascoigne in 1779 at the Carron Ironworks. They were chambered, and attached to the carriage by a loop underneath instead of trunnions. Firing a comparatively large shot accurately at close quarters, they were at that time well adapted for use on board ship, but have long been superseded. See CANNON.

Carron Oil. See BURNS AND SCALDS.

Carrot (*Daucus*), a genus of Umbelliferae, containing about 20 species, mostly natives of the Mediterranean countries. The common carrot (*D. Carota*) is a biennial plant, which ranges as far as India in the wild state, and is universally cultivated for the sake of its root. In all varieties of the wild plant this is slender, woody, and of a very strong flavour; that of the cultivated variety is much thicker and more fleshy, much milder in its flavour and qualities. Its colour is generally red, but sometimes orange or yellowish white. The

sub-varieties in cultivation are also distinguished by their form—some being longer and more tapering than others—by their size, and by the duration of their growth; the *early* kinds, 'Horn carrots,' being also comparatively small, and almost exclusively cultivated in gardens for culinary use, whilst the larger and *late* kinds, 'Long carrots,' are often also grown in fields, especially on the Continent, for feeding cattle. The carrot was known to the ancients, but is said to have been introduced into England from Holland only in the 16th century. In the reign of Charles I., Parkinson relates that ladies sometimes wore carrot-leaves as an ornament instead of feathers; and the beauty of the leaves is still occasionally acknowledged by placing a root, or the upper portion of one, in water, that it may throw out young leaves to adorn apartments in winter. The carrot prefers a light and rather sandy soil, but often succeeds very well on a peat soil.

Besides the various uses in cookery and in feeding cattle, carrots have been roasted and ground in Germany as a substitute for coffee; a syrup is also sometimes prepared from the roots, and even an ardent spirit distilled after fermentation. Carrots were formerly also of some medicinal repute as a laxative, vermifuge, poultice, &c; and the 'seeds' (mericarps) have been employed as a substitute for caraway.

The carrot has many insect enemies which often inflict the greatest injuries upon the crop. Besides suffering from the attacks of a large number of lepidopterous larvæ (*Depressaria*, &c.), the leaves have one or two species of aphids peculiar to them. Serious subterranean mischief is often wrought by the larva of the cockchafer (*Melolontha*), and still more by the larva of *Agriotes segetis*, one of the wire-worms so dreaded by farmers. The larva of the carrot fly (*Psila rosæ*) eats away the surface of the root, causing the so-called rust of carrots.

The Native Carrot of Australia (*D. brachyotus*) is good sheep-fodder when young. In Tasmania the name is erroneously given to *Geranium dissectum* (*pilosum*), whose root is often tuberous. The Deadly Carrot, *Thapsia garganica*, was once of great medical repute.

Carsebreck, the great Scottish curling centre, 11 miles NNE. of Stirling by rail.

Carson, CHRISTOPHER (1809-68), commonly known as KIT CARSON, born in Kentucky, emigrated to Missouri, where for many years he led the life of a trapper and hunter. His intimate acquaintance with Indian habits and languages secured his selection as a guide in Frémont's explorations, and as Indian agent in New Mexico, to which post he was appointed in 1853. For services in this quarter during the civil war, he was brevetted brigadier-general. See his *Life* by Charles Burdett (Phila. 1869).

Carson, EDWARD HENRY, BARON, a distinguished barrister at the Irish and English bars, and leader of the Ulster die-hards, was born 9th February 1854, and educated at Trinity College, Dublin, which he represented in parliament, 1892-1918. A bitter opponent of Home Rule, he organised armed resistance by the formation of the Ulster Volunteers and the 'Covenant' of 1912. In the Coalition cabinets he was Attorney-general (1916), First Lord of the Admiralty (1917), and minister without portfolio (1917-18). In 1918-21 he sat for a Belfast division. He accepted the compromise of 1920, and in 1921 became a Lord of Appeal with a life peerage.

Carson City, capital of Nevada, near the foot of the Sierra Nevada, 178 miles ENE. of San Francisco, has a mint and quartz-crushing mills. Gold and silver are found near by. Pop. 2000.

Carstares, WILLIAM, a distinguished political and ecclesiastical character of the 17th century, who took a very active part in bringing about the Revolution of 1688, was born at Cathcart, near Glasgow, February 11, 1649. He entered the university of Edinburgh in 1663, where he displayed a remarkable aptitude for learning, and graduated in 1667. Carstares went to study theology at Utrecht (1669), where his scholarship, polite address, knowledge of men, and great political information, especially regarding his own country, recommended him to the notice of the Prince of Orange, who chose him as his confidential adviser in all matters relating to Britain. In 1672 he went to London; in 1675 he was arrested and examined before Lauderdale for alleged 'tampering in several matters tending to the disturbance of the public peace,' and was kept prisoner in Edinburgh Castle till 1679. In 1682, being in England on a mission of observation from Holland, he was employed to negotiate between the English and Scotch conspirators a general rising in England and Scotland, Shaftesbury, Russell, and Argyll being the leaders. He knew of the Rye House Plot, but did not approve of it. He was arrested at Tenterden, Kent, conveyed to Edinburgh, and put to the torture of the boot and thumb-screw; a deposition was extracted from him as to his knowledge of Argyll's plot, which, in spite of assurances to the contrary, was immediately used in the trial of Baillie of Jerviswood. After an imprisonment of a year and a half, at London, Edinburgh, and Stirling, he returned to Holland about the beginning of 1685; was appointed second minister of the English church at Leyden (1686) and chaplain to the Prince of Orange, with whom he had constant and confidential intercourse. He accompanied him as chaplain in the invasion of 1688, and after the prince had been firmly established as William III., Carstares was instrumental in effecting a reconciliation between him and the Scottish Church, when the ill advice of other councillors had nearly led to an open rupture. From 1693 to the death of the king in 1702 he could not have had more influence in Scottish affairs if he had been prime-minister of the country; his authority in church matters was such, that he was popularly called 'Cardinal Carstares' by the Jacobites. He was elected principal of the university of Edinburgh in 1703. In 1704 he was presented to the church of Greyfriars, and was appointed Moderator of the next General Assembly, an office to which he was four times elected in the course of eleven years. His great influence was used in procuring the passage of the Treaty of Union. He died 28th December 1715, deeply regretted by the whole nation, leaving a high reputation for tact and ability in ecclesiastical policy, as well as for sincere piety and unbounded private charity. See *Life of Carstares*, by Principal Story (1874).

Carstens, ASMUS JAKOB, a Danish artist, the reviver of art in Germany, was born near Sleswick, May 10, 1754. Apprentice for five years to a wine-merchant, in 1776 he went to Copenhagen to study art; for five years (1783-88) barely supported himself by portrait-painting in Lübeck; and after settling in Berlin, had two years to pass in pinching poverty before his great composition, the 'Fall of the Angels' (with 200 figures), gained him an appointment as professor in the Academy, employment from the court, and a pension. He was now enabled to visit Rome, where he devoted himself to the study of the works of Michael Angelo and Raphael; and his influence in elevating later German art, and in inducing a keener study of these masters, cannot be too highly estimated. His numerous drawings mostly represented scenes from

the ancient classic poets, with subjects from Shakespeare and Ossian. Having broken with the Berlin Academy, he died in the deepest poverty at Rome, May 25, 1798. See his *Life* by Fernow (1806; new ed. 1867), and works by Schone (1866) and Sach (1881).

Cart, a species of carriage with two wheels, thus differing from the ordinary four-wheeled wagon. The Scotch cart, used also in the north of England, is exceedingly convenient for general merchandise or for agricultural produce, and is well adapted for being drawn on roads in a hilly country. Its weight is only about half a ton, while its usual load is from a ton to 22 cwt. Its carrying capacity for hay or straw may be increased by adding 'top-sides' or a spurred frame. Offenders used to be ignominiously exposed by being carted through a town; and were sometimes whipped at the cart's tail. All carts in Great Britain must by law bear the name and address of their owner conspicuously marked on them.

Cartagena, a fortified seaport of Spain, on a bay of the Mediterranean, 326 miles SE. of Madrid by rail. It is built partly on the declivity of a hill, and partly on a plain extending down to the sea, and is inclosed by hills which screen it from all winds. The harbour is one of the best in the Mediterranean, capacious enough to hold the largest fleets. The entrance is narrow, and completely commanded by a fortified island on the south. It was formerly the largest naval arsenal not only in Spain but in Europe. The city presents a Moorish aspect in its streets, its cathedral, and its ruined castle. Cartagena has manufactures of ropes, sail-cloth, and glass, besides extensive blast-furnaces and smelting-works, and exports lead, silver, iron, esparto grass, &c. Pop. of town and suburbs about 100,000. Cartagena, which was a colony of the Carthaginians, was built by Hasdrubal 242 B.C., under the name of New Carthage. It formed the headquarters of the Carthaginians in Spain, and soon became a city of much wealth and influence. It was captured by P. Scipio in 210 B.C., and became of importance under the Romans, who are said to have employed 40,000 men daily in the neighbouring mines. It was sacked by the Goths, and did not again attain any note until the time of Philip II. In July 1873 Cartagena, with its arsenal and war-ships, was seized by a communal junta, but was retaken by the national forces in January 1874.

Cartagena, one of the principal cities of Colombia, stands on a sandy island off the north coast, to the SW. of the mouth of the Magdalena, and communicates by four bridges with its suburb, Jetsemani, on the mainland. Though it has the best harbour on the coast, its trade greatly fell off after the rise of Sabanilla and Puerto Colombia; but a canal connecting it with Calamar, on the Magdalena, has been reopened, and a railway built to the same place; and a return of prosperity has followed the development of the Atrato River gold and platinum fields. The streets are narrow, with high houses, but the place is well built, in the old Spanish colonial style, has an air of dignity and antiquity, and possesses a university, a handsome cathedral, and several churches. The old massive fortifications in part form a promenade. Founded in 1533, it was burned by Drake in 1585, but in 1741 repulsed an attack by Admiral Vernon. In 1815 the royalist General Morillo reduced the place by hunger, after a brave defence; but in 1821 it was again freed from the Spanish yoke. Pop. of Cartagena (or *Cartagena de las Indias*), 50,000.

Cartago, (1) a river and almost landlocked bay or lagoon, communicating with the Caribbean Sea, near the northern extremity of the Mosquito Coast. —(2) A town of Costa Rica, 12 miles E. of the

present capital, San José, on a plain S. of the volcano of Irazú (11,500 feet), was capital till 1841, when it was all but destroyed by an earthquake; pop. 20,000.

Carte, RICHARD D'OYLY (1844-1901), born in Soho, London, was a musical-instrument maker who composed songs and from 1870 produced English comic operas. The success of *The Sorcerer* (1877) and subsequent operas by Gilbert and Sullivan, with whom he was specially associated, enabled him to build the Savoy Theatre.

Carte, THOMAS, historian, was born in 1686 at Clifton-upon-Dunsmore, near Rugby, Warwickshire, where his father was vicar. Educated at University College, Oxford (1698-1702), he took his M.A. both there and at Cambridge, and receiving holy orders in 1707, was appointed reader at the Abbey Church, Bath. In 1714, however, being strongly attached to the Stuarts, he resigned his office rather than take the oaths to the Hanoverian government. In 1722 he was suspected of complicity in the conspiracy of Bishop Atterbury, whose secretary he was, and £1000 was offered for his apprehension; but he escaped to France, where he remained till 1728. After his return, he published a *Life of James, Duke of Ormonde* (2 vols. 1736), more full than lively, and a *History of England* (4 vols. 1747-55), bringing it down to the year 1654. The prospects of this work were blighted by an unlucky note in vol. 1, ascribing to the Pretender the gift of touching for the king's evil. It is very valuable for its wealth of original materials, but the author had not the capacity to grapple with these philosophically. Hume and other historians, however, were much indebted to him for their facts. Among Carte's other works was an edition of Thuanus (*De Thou*, q.v.); and at his death, in 1754, he left behind him 20 folio and 15 quarto volumes of MSS. in further illustration of the history of England to 1688, which are preserved in the Bodleian Library, Oxford.

Carte Blanche, a 'blank paper' authenticated with an authoritative signature, and entrusted to some one to be filled up as he may think best. Thus in 1649 Charles II. tried to save his father's life by sending from the Hague to the Parliament a signed carte blanche to be filled up with any terms which they would accept as the price of his safety. In 1832 Earl Grey was said to have been armed with a carte blanche for the creation of new peers.

Cartel (dim. of *carta*, 'paper') means variously a challenge and a written agreement between belligerents for an exchange of prisoners. Cartel ship is a vessel commissioned to convey exchanged prisoners. For Cartel in its commercial sense, see ASSOCIATIONS, TRUSTS, AND CARTELS.

Carter, ELIZABETH, an English lady remarkable for her knowledge of ancient and modern languages, was born 16th December 1717, at Deal, Kent, and was the daughter of a clergyman. In her twenty-first year she published a small volume of poems, and in the succeeding year she translated (anonymously) from the Italian of Algarotti *Sir Isaac Newton's Philosophy explain'd for the Use of Ladies*. These publications brought her into note, and obtained for her the friendship of such men as Bishop Butler, Archbishop Secker, Sir Joshua Reynolds, Burke, Horace Walpole, and Dr Johnson, the latter of whom especially held her in great esteem, and had a high opinion of her proficiency as a Greek scholar and a good housewife. Her translation of Epictetus was most favourably received by the literary press of her time, both at home and abroad. She died in London unmarried, 19th February 1806, at the age of eighty-eight. See her *Life* by Pennington (1807), and by Miss Gaussen (1906).

Carteret, JOHN, EARL GRANVILLE, one of the most eminent British orators, diplomatists, and statesmen of the 18th century, was born April 22, 1690, his father, who died when he was five years old, being Baron Carteret of Hawnes, Bedfordshire. He received his education at Westminster School and Christ Church College, Oxford. From Oxford he proceeded to London, plunged into the political and social excitements of the period, made the acquaintance of Swift, and in 1710 married Lady Frances Worsley. Entering the House of Lords on May 25, 1711, as second Baron Carteret, he espoused the side of the Whigs, then led by Stanhope and Sunderland, and in 1714 made his first speech in the House of Lords in support of the Protestant Succession. On the accession of George I., the Whigs came into power, and Carteret became a Lord of the Bedchamber. In 1719 he was appointed by Stanhope ambassador extraordinary to Sweden, and succeeded in arranging two treaties of peace, the first between Sweden, Hanover, and Prussia, and the second between Denmark and Sweden. In 1721 he was appointed to one of the two foreign secretaryships, that for the 'Southern Department' of Europe, and as such, attended in 1723 the congress of Cambrai which attempted the settlement of differences between Germany and Spain, and accompanied George I. to Berlin. In 1724 Carteret was appointed Lord-lieutenant of Ireland. His administration, which lasted, with an interruption, till 1730, was decidedly successful, for, although one of his first acts was to order the prosecution of the author, printer, and publisher of *Drapier's Letters*, it was on his recommendation that Wood's coinage was abandoned in 1725. Although he came into collision with Swift over the Drapier prosecution, the two became warm friends before Carteret left Ireland. Between 1730 and 1742 Carteret took the lead in the House of Lords of the party opposed to Sir Robert Walpole. When this opposition succeeded in overthrowing Walpole, Carteret became the real head of the administration which succeeded his, although nominally only Secretary of State for the Northern Department. Carteret held this position till 1744. His foreign policy, it is now generally admitted, was essentially a wise one, its main object being the bringing about of an understanding between Maria Theresa, Frederick the Great, and the Emperor of Germany, and the detachment of the last from his alliance with France. But he had no time to develop it, being driven from power by the Pelhams in 1744, about a month after he became Earl Granville on the death of his mother, who had been created Countess Granville in her own right. In 1751 Carteret consented to become Lord President of the Council under Henry Pelham. But although he held this office till his death, and twice refused the premiership, he was no longer a very pronounced force in British politics, acting chiefly as a medium of communication between his sovereign and the leading politicians of the time. He was, however, instrumental in bringing the elder Pitt into office, and greatly admired his powers. Carteret died at his house in London, January 2, 1763. He was twice married. His first wife died in 1743. In 1744 he married the leading beauty of the day, Lady Sophia Fennor, who, however, died the following year. Carteret, who is described by Horace Walpole and Lord Shelburne as of 'commanding beauty,' was one of the first orators, purest patriots, keenest wits, brightest classical scholars, and most ardent convivialists of his time.

The chief authorities on the life of Carteret are *Lord Carteret*, by Archibald Ballantyne (1887), and the *Carteret Papers* in the British Museum. Carlyle's *Frederick the Great*, Craik's *Swift*, Mahon's *England*, Lecky's *England in the 18th Century*, Horace Walpole's *Correspondence*, Graham's *Annals of the Earls of Stair*, *The Marchmont*

Papers, and Lord E. Fitzmaurice's *Life of Shelburne* may also be consulted.

Carteret, PHILIP, navigator, sailed as lieutenant in Byron's voyage, and commanded the second vessel in Wallis's expedition to the southern hemisphere (22d August 1766). Separated from Wallis in the following April, while clearing the Strait of Magellan, he proceeded alone, discovering Pitcairn's and a number of other small islands, one of which, in the Solomon Archipelago, bears his name, and returned round the Cape of Good Hope to England, 20th March 1769. His long voyage, in a ship ill-found and unseaworthy, added much to the geographical knowledge of his time. He retired from active service in 1794 with the rank of rear-admiral, and died at Southampton, 21st July 1796.

Cartesian Devil, DIVER, or BOTTLE IMP, is a scientific toy named after Descartes. A tall glass vessel is nearly filled with water, and covered with an air-tight piece of bladder or india-rubber. In and on the water floats a small hollow figure, with a hole near the top, partly filled with air and partly with water. When the cover of the glass is pressed, the air beneath is compressed and water enters the floating figure (so as to bring the air in it to the same degree of compression), and the figure sinks in the water, not rising again till the pressure is removed.—For the CARTESIAN PHILOSOPHY, see DESCARTES.

Carthage, a city on the north coast of Africa, the capital of one of the great empires of the ancient world. It was situated on a peninsula at the north-east corner of the region now known as Tunis, and was founded, most probably about the middle of the 9th century B.C., by Phœnicians who came either from Tyre or from the Tyrian settlement of Utica. The Carthaginians were thus of Semitic origin. They were an offshoot from the Canaanites who occupied Palestine before the Jewish invasion, and whose language was closely akin to Hebrew. The name Carthage is a corruption of Kirjath, the Canaanite word for a town, which occurs in Scripture in such names as Kirjath-Baal and Kirjath-Jearim. The city, called Carthāgo by the Romans, and Karchedōn by the Greeks, was known to its own inhabitants as Kirjath-Hadeshath, or the New Town, to distinguish it either from Tyre or from the earlier Phœnician colony of Utica. Its history may be divided into three periods—the period before 509 B.C., when the first treaty was concluded with Rome; the period of the Græco-Phœnician wars in Sicily; and the period of the Punic wars, from 264 B.C. to 146 B.C.

Of the city's rise to power and opulence nothing is known. It does not come within view of the historian until the 6th century B.C., when it appears as centre of a great commerce and the capital of extensive dominions, including part of the north coast of Africa, Sardinia, part of Sicily, and probably Malta. Corsica was acquired about the close of the century. A hegemony was established over Utica, Hadrumetum, Hippo, and the other Phœnician cities in Africa, from which a money tribute was received, while a tribute in kind was exacted from the neighbouring African tribes. Besides pure Canaanites, the Carthaginian population included a large number of Liby-Phœnicians, or half-breeds, the offspring of unions of Phœnicians and Africans. These half-breeds were regarded with keen jealousy by the rulers of the city, and the famous expedition of Hanno, which took place, as far as can be ascertained, towards the close of the 6th century B.C., was fitted out to transport them to distant settlements. There is in the library of Heidelberg a Greek manu-

script termed the 'Periplus' (or 'Circumnavigation'), which is said to be a translation of the account of his voyage placed by Hanno in the temple of Moloch at Carthage. According to this narrative, Hanno sailed beyond the Pillars of Hercules; founded cities of the Liby-Phœnicians; made his way up 'a great river called Chretes' (probably the Senegal); and after having 'sailed by streams of fire,' came to 'a bay which is called the Southern Horn,' and which has been identified with Sherboro Sound, to the south of Sierra Leone. Scarcity of provisions prevented him from sailing farther to the south. (See Mer, *Mémoire sur le Périphe d'Hannon*, Paris, 1885.) About the same time Himilco is said to have explored parts of the northern coasts of Europe, but regarding this voyage we have no trustworthy information. In 525 B.C. Carthage would in all likelihood have been destroyed by Cambyzes but for the refusal of the Phœnicians, who formed part of his fleet, to act against their kinsmen. By the first treaty between Carthage and Rome (509 B.C.) the Romans were restricted from sailing beyond the Fair Promontory (probably Cape Bon)—a provision probably designed to exclude them from Spain, with which Carthage had a great commerce—while the Carthaginians were forbidden to injure any Latin city, even though it should not happen to be subject to Rome. A later treaty, of which the exact date is unknown, imposed harder conditions on the Romans, whom it debarred from trading in Africa and Sardinia, while it permitted the Carthaginians to attack Latin cities not under Roman rule. It forbade them, however, to make any settlement in Italy.

From the beginning of the 5th century B.C. to the date of the city's downfall, the history of Carthage is the history of a struggle for supremacy between the Semitic and the Aryan races—a struggle waged first by the Canaanite and the Greek, and then by the Canaanite and the Roman. The Græco-Phœnician wars were fought for the possession of Sicily, an island only a hundred miles distant from Carthage, and 'the natural bridge between Italy and Africa.' On the outbreak of the Persian war, the Carthaginians determined to annex Sicily at a time when its Greek colonists could receive no aid from the parent cities. In 480 Hamilcar landed on the island with a motley force of Phœnicians, Libyans, Iberians, Corsicans, Sardinians, and Ligurians, said—but probably with exaggeration—to have numbered 300,000 men. Gelon of Syracuse, with 55,000 men, met the invaders at Himera, where Hamilcar was slain and his army cut to pieces. This great victory is said to have been won on the same day as the battle of Salamis. Seventy years elapsed before the Carthaginians renewed the struggle. In 410 B.C. Hannibal, a grandson of Hamilcar, invaded Sicily with 100,000 men, and after massacring the people of Selinus, captured Himera, and there offered up 3000 captives as an expiatory sacrifice to the spirit of Hamilcar. Another expedition was despatched from Carthage in 406 B.C., and in 396 B.C. Himilco blockaded Syracuse, the last of the great Hellenic cities in the island which remained unconquered. But pestilence having broken out among the besiegers, Dionysius, the tyrant of Syracuse, fell upon their camp, and only a fragment of their army escaped to Africa. The struggle went on until the death of Dionysius, success inclining now to one side, now to the other. Then there was peace for twenty years, during which the power of Carthage steadily waxed in Sicily. So formidable did she become, that in 344 the Syracusans appealed to Corinth, their mother-city, for aid against her. The Corinthians sent them 700 mercenaries under Timoleon. With 6000 men Timoleon routed a host of 70,000 Carthaginians as they were attempting to cross

the river Crimessus (339 B.C.); a second Greek victory followed; and the tide of Semitic invasion was rolled back. Carthage sued for peace, and the contest was not renewed until 309 B.C., when Syracuse, under the rule of the tyrant Agathocles, was rent by civil dissensions. Hard pressed at home, Agathocles formed the audacious design of falling upon Carthage while her forces were mainly in Sicily. Eluding the Carthaginian fleet, he landed in Africa, gained victory after victory, and carried the war up to the walls of Carthage. But his presence being urgently required in Syracuse, he had to leave his son Archagathus in charge of the army. Archagathus proved incompetent. On the return of his father a mutiny broke out; Agathocles fled to Sicily, and his troops made peace with Carthage. The Græco-Phœnician wars came to an end with the Sicilian campaigns of Pyrrhus, king of Epirus. That monarch, one of the greatest generals of antiquity, projected the conquest of Carthage, but wasted his strength in a futile contest with Rome, and after leading the Greeks of Sicily with varying fortune against the Carthaginians, was forced to quit the island in 276 B.C.

The first of what are known, from the Latin word *Punicus*, 'Phœnician,' as the Punic Wars began in 264 B.C. The conquest of Southern Italy by Rome had brought face to face the two rivals for supremacy in the Mediterranean world. The Mamertines, a body of Campanian mercenaries who had served under Agathocles, sought and obtained Roman aid against Syracuse and Carthage. The Romans won two great sea-fights at Mylæ (260 B.C.) and at Ecnomus (256 B.C.), and Regulus carried the war into Africa, where he was defeated and his army almost annihilated by the Carthaginians under the command of the Spartan Xanthippus (255 B.C.). In Sicily the Romans were for a time baffled by the consummate generalship of the great Hamilcar Barca, who defied all efforts to dislodge him from the stronghold of Eryx. But he received no adequate support from Carthage, and a naval victory won by Rome at the Ægates Islands brought the war to a close in 241 B.C. Carthage gave up all claim to Sicily, and paid an indemnity of nearly £800,000. But Hamilcar marched out from Eryx with all the honours of war. The Carthaginian mercenaries then mutinied, and were supported by the Libyan tribes. After a bloody struggle which lasted from 241 to 236 B.C., the rebellion was crushed by Hamilcar. That great general then determined to build up an empire in Spain which would compensate for the loss of Sicily and furnish an admirable recruiting ground in the struggle with Rome, of which he foresaw the renewal. He crossed into Spain in 236 B.C., and before his death in 228 B.C. he had by arms and diplomacy extended the sway of Carthage over a great part of the peninsula. His work was ably carried on by his son-in-law, Hasdrubal, who was remarkably successful in conciliating the Spaniards. Hasdrubal was assassinated in 221 B.C., when Carthage held all Spain up to the Ebro.

On the death of Hasdrubal the troops chose as their leader Hannibal, the son of Hamilcar, the greatest of all the Carthaginians, and 'the greatest captain that the world has seen.' In 219 B.C. Hannibal captured the town of Saguntum, a city in alliance with Rome. The Romans, who had long been jealous of the progress their rivals had made in Spain, thereupon declared that the treaty was broken, and the Second Punic War began. That war is in this work dealt with in the articles HANNIBAL and ROME. It was, as Arnold has said, the war of a man with a nation; no other war shows so impressively what the genius of a

single man can achieve. The campaigns of Hannibal are the most wonderful in all history. Here, however, it must suffice to say that he led his men from the Ebro to Italy; that he had himself in a great measure to create the far inferior forces with which, in battle after battle, at the Ticinus and the Trebia, at Trasimenus and at Cannæ, he broke and drove the legionaries, the best soldiers of the ancient world; that he brought Rome to the verge of ruin, and that his victories would, in all likelihood, have been crowned by her capture had he been duly supported from home. But his countrymen were unworthy of the great Carthaginian. After having maintained himself in Italy for fifteen years, he was recalled in 203 B.C. In 202 B.C. Publius Cornelius Scipio invaded Africa and won the battle of Zama. Peace was then concluded. The Carthaginians were forbidden to make war on any state without permission of the Romans. They were compelled to give up all war-ships except ten, and to pay an indemnity of ten thousand talents and an annual tribute of two hundred.

In the years between the Second and the Third Punic Wars, Massinissa, king of Numidia, made repeated aggressions on Carthage. The Carthaginians appealed in vain for justice to the Romans, who had resolved on the destruction of the city, and who declared war in 149 B.C. Carthage fell in 146 B.C. It was taken by Publius Cornelius Scipio Æmilianus after a siege of two years. For six days the fighting went on in the streets of the city, the people, men and women, defending their houses with a fierce determination which recalls the resistance of the Jews in the siege of Jerusalem by Titus. The city was razed to the ground, and the country became a Roman province. At the time of the siege Carthage is said to have had 700,000 inhabitants.

Carthage was to rise again as a Roman city, but her capture by Scipio closes her history as the capital of a Phœnician state and the centre of a vanished civilisation. Our knowledge of that civilisation is meagre and vague in the extreme. And it must be remembered that what we do know of Carthage is derived from her implacable enemies. To the Greeks the Carthaginians seem to have been more repugnant than any other 'barbarians.' With the Romans 'Phœnician' was synonymous with all that is cruel and treacherous. Yet, were it not for Greek and Roman writers we should know nothing of Carthaginian history. In reading that history, wide allowance must be made for the fact that no Carthaginian version of it has come down to us. Still, even when that is done, it is hardly possible to follow with sympathetic interest the fortunes of Carthage apart from those of the great family of Barca. Her people were bold and skilful sailors, and the most industrious and enterprising of merchants. She produced several men of high practical ability, and one man of incomparable military genius. But her people had not the qualities of an imperial race. A nation of traders, they trusted in war principally to mercenaries; it was seldom that native Carthaginians, save in times of acute peril, formed any considerable part of the army. Their rule was peculiarly oppressive, and their subjects were at all times ready to rise against them. In the struggle with the Greeks they committed the bloodiest atrocities. Their civilisation seems to have been wholly material; they had apparently no artistic genius; their religion was the most hideous ever practised by a people emerged from barbarism. Their overthrow by Rome was, it can hardly be doubted, a gain to mankind. Still, it must never be forgotten that it was in this strange Canaanite people, 'alone of barbarian nations, that Greece and Italy found real instructors, worthy rivals in commerce, policy, and warfare' (Freeman).

Like other Canaanites, the Carthaginians practised a horrible form of fire-worship. Their chief god was Moloch or Baal-Hammon, who represented the destructive power of the sun. In his temple there burned a furnace into which human victims were cast. These were generally captives taken in war, but in times of extreme peril native Carthaginians were also sacrificed; when Agathocles besieged the city, it is said that 200 children belonging to the noblest families were slain to propitiate the god. The moon-goddess, Ashtaroth, the Greek Astarte, was worshipped under the name of Tanit. Melkart, who corresponded to the Greek Hercules, was held in special honour, and missions with offerings were sent at regular intervals to his great temple at Tyre. A sea-god, whom the Greeks identified with Poseidon, was in all probability the same as the Philistine fish-god Dagon. Another deity named Esmun seems to have presided over healing. Religious honours were paid to deified heroes; to certain genii or spirits; to various animals—among them the lion, the bull, and the serpent—and to several of the Greek divinities, with whom the Carthaginians became acquainted in Sicily. There appears to have been an order of priests, but sacrificial rites were performed by the generals and the principal magistrates.

The constitution was oligarchical. The two chief magistrates were called by the Romans *suffetes*, a corruption of a Canaanite word corresponding to the Hebrew *shophetim* or 'judges.' The *suffetes* were chosen from the members of certain distinguished families. The tenure of office is uncertain; some seem to have been elected annually, others for life; but they could not lead an army or a fleet unless specially appointed to the command. The senate contained an inner council of a hundred, which seems to have been the chief executive power in the state. It exercised a jealous supervision over the generals, who had on returning to the city to submit reports of all their transactions to its members. There was also an assembly of the people, which seems, however, to have had very slight political influence. According to Aristotle, the state officials were unpaid. So far as can be ascertained, justice was administered by special courts. The oligarchy seems to have been invariably rent into factions, and corruption was rife during at least the later period of Carthaginian history. An immense revenue was necessary to maintain the navy and mercenaries. It was drawn from heavy customs duties levied on imported goods, from the tribute paid by other Phœnician cities and the subject African tribes, and from rich mines worked by the state in Corsica and Spain. The contributions in kind were partly transmitted to Carthage, partly stored up in the provinces for the service of the army. The state could without difficulty send out a force of 100,000 troops. The fleet which was defeated at Ecnomus numbered 350 ships, and had 150,000 men on board. The commerce of Carthage was not confined to the Mediterranean ports. Her ships sailed as far west at least as the Azores, as far north as Britain and the Baltic; and she carried on an immense trade with the interior of Africa. Some of her caravans pushed across the Sahara to the basin of the Niger; others journeyed regularly between Thebes, in Egypt, and the Strait of Gibraltar, following a route with fixed stations for halting, which are carefully set down by Herodotus. Slaves, gold, ivory, and precious stones were the staple of the African trade. Wine, cattle, iron, fruit, &c. were imported from the Mediterranean countries. Spain and Sardinia furnished silver; Corsica, slaves; Britain, tin and copper; the Baltic, amber. A considerable overland trade was carried on through Spain with the Gallic tribes, as the

Massilians would not allow trading stations to be established on the southern coast of Gaul.

The Carthaginians had no aptitude for art—even their coins bear the impress of Greek design and workmanship—and if they had a literature it has perished. When the city was taken by Scipio, the contents of its libraries, which may have been principally Greek works, were dispersed and lost. A single book, a treatise on agriculture, ascribed to one Mago, was preserved and translated into Latin by order of the Roman senate. Cicero speaks of this work (*De Re Rustica*) as being in his day the standard authority on its subject. Humilo is said to have written an account of his voyage to the north-western shores of Europe, and, according to Livy, Hannibal wrote a history of his own campaigns. A corrupt form of the Carthaginian or Canaanite language was spoken in parts of North Africa in the days of Augustine, who was struck by the close resemblance which it bore to Hebrew.

Some twenty years after the destruction of Carthage, Caius Gracchus endeavoured to found a Roman colony on her site. This scheme, which at first ended in failure, was carried out by Augustus, in accordance with the intentions of Julius Cæsar. In the 3d century A.D. the new Carthage had become one of the chief cities of the empire. It figured conspicuously in ecclesiastical history, being the scene of several important councils and synods. At a church conference held there in 411 A.D. the suppression of the Donatists was decreed; and the Pelagian heresy was condemned by a council of Carthage held in 418 A.D. The city, which was seized by Genseric in 439 A.D., became the capital of the Vandal kingdom of Africa, and after an interval of six centuries, the fleets that issued from the port of Carthage again claimed the empire of the Mediterranean (Gibbon). The Vandal kingdom was overthrown by Belisarius, who took Carthage in 533 A.D., and named it Justiniana. The city, which Heraclius at one time proposed to make the capital of the empire, was destroyed by the Arabs under Hassan, governor of Egypt, who conquered part of Northern Africa for the Khalif Abd-al-Melik in 692–98 A.D.

See the histories of Rome; Bosworth Smith, *Carthage and the Carthaginians* (1879); Perrot and Chipiez, *Art in Phœnicia* (trans. 1885); Davies, *Carthage and her Remains* (1861); Hennebert, *Ambal* (Paris, 1870–78); Church, *Carthage, or the Empire of Africa* (1886); Meltzer, *Geschichte der Karthager* (1879–1913); Acton Macdonald, *Massilia-Carthago* (1897); A. Graham, *Roman Africa* (1902); Miss Moore, *Carthage of the Carthaginians* (for excavations, &c., 1905); Douglas Sladen, *Carthage and Tunis* (1906); Petrie, *Tunis, Kairouan, and Carthage* (1908); S. Gsell, *Histoire Ancienne de l'Afrique du Nord* (1913 et seq.). Among ancient writers, the chief authorities on Carthage are Polybius, Diodorus Siculus, and Livy. Flaubert's *Salammbô* is a vivid picture of ancient Carthaginian life, marvellously learned in details and illumined with genius. The site has been excavated by Delattre and others. In 1923 American subscribers guaranteed a large sum for more extensive digging, and a *Preliminary Report* by Professor F. W. Kelsey was issued in 1925. For legendary history, see DIDO.

Carthagera. See CARIAGERA; and for Carthagera Bark, see CINCHONA.

Carthamine, or CARTHAMEINE, a dye got from *Carthamus tinctorius*, or Safflower (q.v.) in crystals which are insoluble in water, slightly soluble in ether, and which with alcohol readily form a purple-red solution. When newly precipitated, carthamine immediately and permanently attaches itself to cotton or silk (but not to wool), requiring no mordant. It dyes the fabric a fine red, which is changed to yellow on the addition of alkalis, and may be returned to red again on being treated with acids. The safflower contains about .5 per

cent of carthamine, and also about 25 per cent. of a yellow colouring matter called safflower-yellow, which, however, is of no value in dyeing. *C. tinctorius* also yields kardi seeds, whence carthamus oil.

Carthamus. See CARTHAMINE, SAFFLOWER.

Carthusians, a monastic order which owes its origin to St Bruno, who retired c. 1086 with six companions to the solitude of La Chartreuse (q.v.—hence the name), where they built hermitages, wore rude garments, and lived upon vegetables and coarse bread. In 1134 the fifth prior, Guigo, composed a body of rules, called the *Statuta Guigonis* or *Consuetudines Cartusie*, but they have been often changed. After 1176, when the order received papal approbation, it extended rapidly. It dates from c. 1170 in England, where the name of Chartreuse was corrupted into Charterhouse (q.v.). The Carthusians were divided into two classes, fathers (*patres*) and brothers (*conversi*). Each occupied a separate cell, with a bed of straw, a pillow, a woollen coverlet, and the means of manual labour or of writing. They left their cell, even for meals, only on festivals and on days of the funeral of a brother of the order. Thrice a week they fasted on bread, water, and salt, and there were several lengthened fasts in the year. Flesh was forbidden at all times, and wine, unless mixed with water. Unbroken silence, except on rare occasions, was enforced, as well as frequent prayer and night-watching. These austerities were continued, with little modification, by the modern Carthusians. The order at one time had 16 provinces, and some of the finest convents in the world—as La Grande Chartreuse, near Grenoble, and Certosa, near Pavia. They were given to hospitality and works of charity, and were on the whole better educated than the mendicant orders. Their principal seats were in Italy, France, and Switzerland. The monastery at Parkminster, Sussex, was founded by exiles from Chartreuse (q.v.).—The Carthusian nuns (1229) followed the Carthusian rules, with some mitigations.

Cartier, JACQUES, a French navigator, discoverer of the St Lawrence, born at St Malo, 31st December 1494, between 1534 and 1541 made three voyages of discovery to North America (see CANADA). He died at St Malo, 1st September 1557. See *Lives* by Longrais (1888) and Baxter (1906). His *Voyages* were published in Canada in 1924.

Cartilage, or GRISTLE, is a firm elastic substance, of a pearly whiteness, presenting to the unaided eye a uniform and homogeneous appearance. Cartilages may be divided into the *temporary* and the *permanent*. The *temporary* cartilages are substitutes for bone in the earlier periods of life, and after a certain time become ossified. At birth the extremities and larger eminences of the long bones and the margins of the flat bones are still cartilaginous, and this cartilage does not altogether disappear till the period of puberty. The *permanent* cartilages are either *articular* or *non-articular*. *Articular* cartilages are attached to the extremities of bones, and enter into the formation of joints. *Non-articular* cartilages are usually more flexible than the articular. They are sometimes attached to bones to lengthen them out, as, for instance, the costal or rib cartilages which form a considerable part of the framework of the thorax, and impart elasticity to its walls. They are present in the nose, the auditory canal, and the Eustachian tube. In other cases they form the basis of distinct organs, as the larynx, the trachea, and the eyelids. The physical properties of cartilages, especially their elasticity, resisting power, and incapability of extension, are such as to fit them admirably for the functions which they have

to perform in the animal economy. See CELL, BONE, LARYNX; and for the chemical constituents, see ANIMAL CHEMISTRY, GELATINE, and GLUTEN. Cartilage is liable to inflammation, to ulceration, and to ossification; for the diseases of the larynx, see that article.

Cartilaginous Fishes, a designation which may be usefully restricted to that sub-class of fishes to which sharks and skates belong, and to which the technical titles of Elasmobranchii and Chondropterygii are usually applied. It is true that the double-breathing Dipnoi and many of the Ganoids are in great part cartilaginous, but there is no possibility of confusing either of these sub-classes with the Elasmobranchs. Similarly the cartilaginous round-mouths, or Cyclostomata (see HAG, LAMPREY), are quite apart from ordinary fishes—e.g. in the absence of jaws, limbs, and scales, and presence of an unpaired nasal canal and purse-like gills.

General Characters.—In these lowest fishes, then, the skeleton is gristly or cartilaginous, and the teeth and scales are (with the exception of slight hints in the vertebral column) the only bony structures. The skin bears skin-teeth (dermal denticles) or the so-called placoid scales, tipped with enamel, cored with tooth-substance or dentine, and banded with bone. There is no gill-cover (*operculum*) over the gills, and the slits from the throat, usually five in number, open directly to the exterior. The gill-filaments are attached to either side of the partitions between the gill-slits. An anterior gill-slit, ahead of the usual five, usually opens on the dorsal surface behind the eye, bears only a trace of a gill, and is known as the spiracle. The ventricle of the heart has an anterior contractile portion, known as the *conus arteriosus*, which leads on into the vessel taking impure blood to the gills. The hind-fins are situated far back, and bear accessory clapping organs in the males. The intestine has a spiral fold running down it internally, known as the 'spiral valve.' The air-bladder is almost always entirely absent, but rudiments of it are sometimes seen. The eggs are usually laid in horny cases, such as the mermaid's purse of the skate; but not a few forms are viviparous—that is to say, the eggs develop in the oviducts. The embryos bear external gills. The Elasmobranchs are marine, and voraciously carnivorous in their diet.

History.—The cartilaginous fishes are undoubtedly the most primitive existing forms, and are of special interest on that account. The cartilaginous nature of their internal skeleton was obviously unsuited for fossil preservation, and thus their earliest records are limited to the bony scales and teeth. The oldest traces are found in the Upper Silurian, and are preceded by the armoured ganoid Pteraspis. They are scanty in the Devonian, but profuse in the Carboniferous, and become predominant among fishes in the Jurassic period. They retain this ascendancy throughout Tertiary times. One of the most ancient living representatives is the deep-water frilled shark (*Chlamydoselachus*). It has pronged teeth like the 'cladodonts' of the Middle Devonian, an anterior mouth, two dorsal nostrils, a large free opercular fold, six gill-clefts, and a slightly bent-up asymmetrical tail.

Classification.—A divergent offshoot from the main tribe is represented by the Holocephali (with a single gill-opening and jaws firmly fixed to the skull), including the two genera *Chimæra* (King of the Herings) and *Callorhynchus*. All the other members of the sub-class have 5 to 7 gill-openings and jaws movably attached to the skull. They are often designated *Plagiostomata*, or cross-mouthed, for the mouth lies as a transverse slit on the under side of the head. They are conveniently distinguished into two sub-orders—(a)

Selachoides—shark-like forms, and (b) Batoidei—skate-like forms. In the former the gill-openings are lateral, and the body more or less cylindrical; in the latter the gill-openings are ventral, and the body flattened. Sharks, dog-fish, monk-fish or angel-fish, illustrate the first sub-order; skates, rays, torpedos, and sting-rays the second.

Cartography. See MAP.

Cartoon, a design on strong paper of the full size of a work to be afterwards executed in fresco, oil-colour, or tapestry. The design when completed is transferred, by tracing or pouncing, to the surface finally to be worked on. The most famous cartoons are those of Raphael (q.v.).

Cartouch (Fr *cartouche*, Ital. *cartoccio*, 'a roll of paper;'" *cartridge* is a mere corruption), formerly a name for a portable wooden case for holding cannon-balls or musket-bullets. A gun cartouch now means merely a waterproof canvas case for holding the cartridges of a field battery, one to each ammunition-box. The cartridge-box carried by the soldiers used to be called a cartouch in England, and still is in France.

Cartouche, the name given by Champollion to the ovals on monuments and in papyri on which the hieroglyphic characters for the names of Egyptian kings are inscribed. In architecture, cartouche signifies a tablet, either for ornament or to receive an inscription, so formed as to resemble a sheet of paper or parchment, with the edges and ends rolled up. The same term is applied to modillions, or brackets supporting a cornice, and, in heraldry, to the oval escutcheon of an ecclesiastic.

Cartridge. The word is a corruption of the French *cartouche*, meaning a paper case, and originally denoted solely the charge of gunpowder, contained in a bag, for a cannon. Such a cartridge is shown in fig. 1; but the word has now a much more extended meaning, and covers all the articles shown in figs 1 and 2, and in figs. 6 to 9.

Fig. 1.

Fig. 1 shows a cartridge practically identical with that used, at least, as long ago as 1560 for shotted guns, and with that often used to-day. A woollen material, such as flannel or serge, is used for the bag, being less liable to leave smouldering fragments in the gun than linen or cotton, and the need of a very strong material for the large charges of gunpowder used latterly for heavy guns led to the adoption of a

Fig. 2.

coarse silk cloth. Gunpowder cartridges have varied in weight, from a few ounces to about 100 lb. The largest total charge for a gun ever used in the British (and probably any other) service was the 960-lb. charge for the 16.25-inch gun of 110 tons, firing a projectile of 2000 lb. It was made up in eight cartridges.

Fig. 2 shows a modern cartridge of smokeless explosive in cord or tube form. At one end it has a priming of gunpowder (A) which, being placed

next the vent, is fired first by the tube (see below). Modern smokeless explosives are difficult to ignite, and to get regular ignition such a priming is usually required. (For cordite and other smokeless powders, see under GUN-COTTON.) The cordite charge for the British 15-inch gun weighs 428 lb., and is made up in four cartridges.

Cartridges in early days were fired by 'priming' the vent with fine gunpowder, and igniting the priming by a red-hot iron or smouldering slow match. They are now fired by tubes inserted in the vent.

Fig. 3 shows in section a 'friction' tube, made of copper tubing filled with gunpowder. On pulling out the friction bar (A), the friction composition (B) round it is fired, and thereby the gunpowder charge (C). The ball in the mouth of the tube pierces the cloth of the cartridge-bag. When the cartridge fires, the gases generated blow the fired tube out of the vent, and this backward rush of gas destroys the vent channel so rapidly that modern tubes, now to be described, are held firmly in, and seal, the vent when the cartridge fires (see BREECH-LOADING). These tubes are made of brass. With the 'percussion' tube, shown in fig. 4, a hammer strikes the plunger (A), and so fires the percussion-cap (B)

Fig. 3.

Fig. 4.

and gunpowder (C). The electric tube (fig. 5) is fired by passing an electric current, as shown

Fig. 5.

diagrammatically by the dotted lines and arrows, and so rendering the thin wire 'bridge' (A) red-hot, thereby firing the priming in which it is embedded and the gunpowder (B).

Fig. 6 shows in part section a cartridge for a quick-firing gun (see CANNON). It consists of a brass case, carrying, fixed permanently in its mouth, the projectile, and filled formerly with gunpowder, but now with smokeless explosive. At its base, in a removable 'primer,' is a percussion-

Fig. 6.

cap and a small charge of gunpowder. For quick firing guns larger than about a 25-pounder, the

weight of such a cartridge becomes inconveniently great, and the projectile and case are loaded separately.

Fig. 7 shows the cartridge for the British '303-inch rifle. The case is of brass, the cordite charge weighs about 38 grains, and the 'enveloped' bullet

Fig. 7.

174 grains. Except that a grain-powder is used more commonly abroad, and was used by Great Britain to a considerable extent during the war of 1914-18, and probably will be in the future, it represents in essentials the cartridge of any military rifle. Re-

Fig. 8.

placing the sharp-pointed bullet by one of the form shown in fig. 8 (the hollow in the nose of which is intended to cause the bullet to expand on impact), we have the sporting cartridge, for use against soft-skinned animals, now very generally adopted. In the so-called 'express' sporting rifles, which fire a much larger and heavier bullet than the small-bores at a much lower velocity, a plain lead bullet without envelope is used. See RIFLES for the reasons necessitating the use of an envelope.

Fig. 9 shows a sporting-gun cartridge. It consists of a stout paper cylinder with a metal base

Fig. 9.

carrying the percussion-cap. The details of filling are clear from the illustration. Sometimes paper is replaced by thin brass.

Pistol cartridges are similar to rifle cartridges, but much shorter. In some the detonating composition, usually held in a cap, is contained in the rim of the case.

Cartridge-paper, a light-coloured strong paper, originally manufactured for cartridges, is extensively used in art, its rough surface being useful for certain kinds of drawing.

Cartwright, EDMUND (1743-1823), the inventor of the power-loom, was born at Marnham, Nottinghamshire. Educated at Oxford, he obtained the rectory of Goadby-Marwood, Leicestershire (1779), where on his glebe-land he made improvements in agriculture. A visit to the cotton-spinning mills of Arkwright in Derbyshire directed his attention to new methods of weaving. The result in 1785 was the power-loom. At Doncaster he set up a factory, in which his power-loom was used, but, owing to opposition and expense, had to give up business. A mill at Manchester with four hundred power-looms was burned down. It was not till the beginning of the 19th century that the power-loom came into practical use. In 1790 Cartwright took out a patent for combing wool, and secured patents for various other improvements in connection with manufactures. He even joined Robert Fulton in his experiments for applying steam to navigation. All these efforts brought him no direct gain, but in 1809 government granted him £10,000. He wrote some verse.

Cartwright, JOHN (1740-1824), the 'Father of Reform,' was a brother of the preceding. At eighteen he entered the navy, saw some service

under Howe, and in 1766 was gazetted first-lieutenant of the *Guernsey*, on the Newfoundland station. He returned in 1770, and was appointed in 1775 major to the Notts militia. He now began to think and write on political questions, and found himself unable to take service under Lord Howe in North America. From the beginning he advocated annual parliaments, vote by ballot, and manhood suffrage, and throughout his busy life he advocated with equal ardour causes so different as reform in farming, abolition of slavery, the foundation of a Valhalla for English seamen, the improvement of national defences, and the liberties of Spain and Greece. Cartwright was fined £100 for sedition in 1820.

Cartwright, PETER (1785-1872), an eminent Methodist preacher, born in Virginia, was ordained in Kentucky in 1806, and in 1823 removed to Illinois, where he laboured for nearly half a century. He also sat in the state legislature there, and in 1846 was defeated by Abraham Lincoln in an election for congressman. See his *Autobiography* (1856) and *The Backwoods Preacher* (Lond. 1869).

Cartwright, THOMAS, Puritan divine, was born in Hertfordshire about 1535. He was compelled to quit Cambridge owing to his attachment to the Reformed doctrines, but returned on the death of May. He retired to Ireland (1565-67), and after his return in 1569 he was chosen Lady Margaret Divinity professor. His lectures here were too honestly critical of the polity of the church to be acceptable to the chief authorities, who, led by Whitgift, deprived him of his professorship, and subsequently of his fellowship. He travelled on the Continent, and on his return to England in 1572 he again became embroiled with the church and the government, and for his nonconformity suffered imprisonment several times. Again obliged to flee to the Continent, he was for a time pastor of the English church in Antwerp. On his return in 1585 he was once more committed to prison. He was one of the most influential Puritan teachers of his day. He died at Warwick, where he had become master of Leicester's Hospital, 27th December 1603.

Carucate (Lat. *carruca*), probably originally an amount of land such as one team of eight oxen could plough in a season. The *carucage* was a tax on the carucate, first imposed by Richard I. in 1198.

Carum. See CARAWAY, PARSLEY.

Carúpano, a port of Venezuela, on the north coast of the peninsula of Paria. The surrounding district is fertile, and has mines of copper, sulphur, silver, lead, and lignite; it also exports cocoa, coffee, and fish. Pop. 10,000.

Carus, JULIUS VICTOR (1823-1903), an eminent zoologist, born at Leipzig. He studied medicine and surgery at Leipzig, further at Würzburg and Freiburg, and in 1849 went to Oxford as keeper of the museum of comparative anatomy. In 1853 he became professor of Comparative Anatomy at Leipzig. Besides works on general zoology, he wrote many elaborate and masterly monographs.

Carus, KARL GUSTAV (1789-1869), a German physiologist and physician, was born at Leipzig. He lectured on comparative anatomy at Leipzig, on midwifery at Dresden, where afterwards he became court physician and councillor of state. He wrote on anatomy, physiology, and allied subjects.

Caruso, ENRICO (1874-1921), M.V.O., a great Italian operatic tenor, born in Naples, sang in Italy, South America, London, New York, &c. He was a Chevalier of the Legion of Honour.

Carvacrol, a phenol isomeric with thymol, with similar properties. It is got from Cyprus origanum (*Origanum dubium*; see MARJORAM) and other labiate plants.

Carvalho. See POMBAL.

Carver, JOHN, born about 1575, was the leader of the Pilgrim Fathers (q.v.), and died at New Plymouth, Massachusetts, in April 1621, within five months of their landing.

Carvin, a town of the French department of Pas-de-Calais, 11 miles SSW. of Lille by rail, with minor manufactures; pop. 10,000.

Carving is generally at its best among people who are striving after a high ideal. In illustration of this we have but to turn to the carvings and sculptures of Assyria and Greece, the work of the Moorish and early Gothic periods, and the Renaissance. In times of luxury, when men's minds generally become relaxed, its chief characteristics are high finish and dexterous execution; but these too commonly speak only of expense and brainlessness, and the further they are carried the more do they evince the want of true artistic perception.

It is noticeable that nowadays there is not an all-pervading spirit among art craftsmen stimulating them to combined effort after one common high ideal, but the prevailing tendency is towards what is generally termed the Renaissance style of work. With this tendency designers and art workmen naturally turn to the examples of the Roman period from which the men of the Renaissance took their inspiration, but which in point of fine design and execution they certainly did not surpass, as the numerous examples in the Vatican and Capitol at Rome can show.

The endlessly varied forms to be found in nature must ever yield the most fruitful suggestions for the study of the carver, but it will depend upon the material he is working with how far he can approximate nature in his representations. In box-wood or lime-tree it is possible to imitate the general form of the rose blossom, while in stone it can only be very partially done. This consideration has all over the field of design been a great factor in determining the character to be imparted to the subject of study, and it is at once apparent that in carving granite its hardness and mottled appearance suggest a broader, stronger treatment than would be suitable for statuary marble. In the treatment of carving for structural work, the scale and spirit of the whole design must necessarily be kept in view, and in all the best styles of architecture a conventional treatment of natural forms is observable; and it is evident that craftsmen in this branch of industry must possess a wide intelligence in the matter of style, that they may handle their work in sympathy with the designer of the whole scheme, be it a building, a monument, or a piece of furniture of any sort.

Some methods are in use for cheapening carvers' work—e.g. in the case of scroll or fretted work in which raised forms are disposed over a smooth ground, the ornament is cut out with a fret-saw and glued to the ground. This is not at all a desirable method of cheapening work, as the process is generally too easily observed by the different colour or texture of the two pieces of wood, and there is the risk of the two woods being affected differently in the course of time by the atmosphere, and separating. Then there is a grounding machine, which has a revolving drill moving over the spaces forming the ground of the ornament. And, lastly, there is what is called a carving machine, which works with one or more drills moving over the work to be carved in correspondence with a tracing point which traverses the surface of an iron model of what is to be carved. After the revolving drill has covered the whole design, the wood block needs a little hand-facing to take out the drill marks. These methods are

useful commercially, where many repetitions of the same object are desired, but a mechanical feeling is apt to show itself, and this is contrary to the spirit of the true carver's work.

A glance at the carvings of India, Persia, Japan, and China, impresses us with the cheapness of labour in these countries, and of the widespread love of this art, as well as of the great perfection that has been attained in it. But the commercial spirit of the age is causing serious deterioration of this long famous industry in these countries, owing to the desire on the part of the natives to produce what will sell in European markets, and also from the wish to produce in a month what formerly would have been a labour of love for a year.

In Great Britain, from the beginning of the 18th century, carving was for long much affected by a style of work which had Grinling Gibbons (q.v.) for its chief exponent. Examples of his art are to be seen in St Paul's and Chatsworth. His work is famous for its wonderful dexterity in carvings of foliage, flowers, birds, busts, and draperies in lime and other white woods. But he shows a free disregard of architectural soberness and conventionality, and impresses one at times with the idea that he desired to exhibit his skill in cutting delicate forms from solid blocks more than in the adornment of architectural work. See SCULPTURE, WOOD-ENGRAVING; works by Bemiose (1880), Miller (1885), F. G. Jackson (1903), and Rowe (1907).

Carwell, MME (LOUISE DE KEROUALLE). See CHARLES II.

Cary, ALICE, American author, born 26th April 1820, near Cincinnati, Ohio, removed in 1852 to New York, where she died 12th February 1871. Her poems, stories, and sketches are graceful and natural, and full of charming pictures of domestic life; and the *Cloverbrook Papers* (2 series, 1851-53), which embrace some of her happiest efforts, are said to be partly autobiographical.—Her sister, PHOEBE, born 4th September 1824, joined Alice in New York in 1852. She published independently several volumes of buoyant, pleasant verse, and contributed a third of the *Poems of Alice and Phoebe Cary* (1850). She died 31st July 1871. See Mrs Ames's *Memorial of the sisters* (New York, 1873).

Cary, REV. HENRY FRANCIS, translator of Dante, was born at Gibraltar in 1772. He was educated at Rugby, Sutton-Coldfield, and Birmingham, in 1790 entered Christ Church College, Oxford, and in 1796 took holy orders. In 1805 he published a translation of the *Inferno*, in 1814 of the whole *Divina Commedia*, a translation remarkable not only for its fidelity but for its force and expressiveness. He later translated Pindar's *Odes* and Aristophanes' *Birds*, and wrote a series of memoirs in continuation of Johnson's *Lives of the Poets*. Assistant-librarian in the British Museum (1826-37), he died 14th August 1844. See Memoir by his son (1847), and Life by R. W. King (1925).

Cary, LUCIUS. See FALKLAND.

Cary, SIR ROBERT. See CAREY.

Carya. See HICKORY.

Caryatides (pl. of *Caryatis*, lit. 'a woman of Caryæ'), a name given to female figures, in Greek architecture, when used instead of columns to support an entablature. The traditional account of the origin of the name is that the inhabitants of Caryæ, a city in Arcadia, having joined the Persians after the battle of Thermopylæ, the Greeks, after their victory over the Persians, destroyed the town, slew the men, and carried the women into captivity. As male figures representing Persians were already used for this purpose, it occurred to Praxiteles, and other Athenian artists, that female

Caryatides, in their national costume, might be thus employed to commemorate the disgrace of their country. Male figures used for the same purpose are called *Atlantes* (q.v.). The *caryatides* which form the portico of St Pancras Church (1822) in London are a reproduction from the Erechtheum on the Acropolis at Athens.

Caryatis :

From Villa Strozzi, on
Applan Road—height,
7 feet 10 inches.

stricted sense, the order is divided into *Sileneæ*, with calyx united, and *Alsineæ*, with sepals separate. Many of the former produce beautiful flowers—e.g. pink, carnation, sweet-william, lychnis, &c.; but the latter and lower group are largely inconspicuous weeds—chickweed, spurrey. Some botanists separate the *Illecebracæ*, or *Paiony-chiacæ*, from the order. The *Caryophyllacæ* are mostly natives of temperate and cold countries in the Old World. Almost all are insipid and inert; a few contain *saponine*, and afford a substitute for soap. See SOAPWORT.

Caryophyllus. See CLOVES, MYRTACEÆ.

Caryopsis, in Botany, a fruit in which the seed and pericarp are inseparable, e.g. the grain or fruit of grasses, such as wheat, barley, rye, maize, &c.

Caryota, a genus of lofty palms, natives of the East Indies, easily recognised by their remarkable twice pinnate leaves. One species, *C. urens*, remarkable for the acidity of its fruit, which produces a burning sensation when its pulp is applied to the skin, is also highly valuable for the great quantity of sap (*today*) which flows from its wounded spathes, sometimes, in the hot season, to the amount of 100 pints in twenty-four hours from a single tree. Sugar (*jaggery*) is made from this juice by boiling it down, and on this account this palm is sometimes called the Jaggery palm. The 'cabbage' is eaten. The pith yields a kind of sago. The outer part of the stem is very hard, and applicable to many purposes. The fibres of the leaf-stalks are twisted into ropes, the leaf-stalks make fishing-rods, and the woolly substance found at their base is used for caulking ships.

Casabianca, LOUIS, a French naval officer, born at Bastia about 1755, sat in the National Convention of 1792, and in 1798 was captain of the flagship *L'Orient* in the expedition to Egypt. He was mortally wounded at the battle of the Nile, August 1, 1798; the ship caught fire; his ten-year-old son would not leave him, and both (contrary to Mrs Hemans's version of the story) were floating on the wreck of the ship's mast when the final explosion took place.

Casablanca, chief port of Morocco, on the Atlantic, 162 miles SW. of Fez. Wool, cereals, phosphates, skins, eggs, &c. are exported; sugar,

cotton, &c. imported. It has a good harbour and rail communication with the interior. The town was bombarded and occupied by the French in 1907, and in 1908 an arrest there led to a dispute between Germany and France, settled by the Hague Court, 1909. Pop. 100,000 (including 40,000 Europeans).

Casale, a city of N. Italy, on the Po, 21 miles NNW. of Alessandria, with a cathedral and manufactures of silk. In 1474 it became the capital of the marquise of Montferrat (q.v.). Pop. 20,000.

Casalpusterlengo, a town of Northern Italy, 22 miles SE. of Milan by rail, with a large trade in cheese; pop. 7000.

Casamicciola, a favourite watering-place on the island of Ischia, beautifully situated in a valley on the north side of Monte Epomeo, with hot springs (158° F.), baths, hotels, &c.; population, 4000. The season extends from June to September. By the earthquake of 28th July 1883 the place was almost entirely destroyed.

Casanova de Seingalt, GIOVANNI JACOPO, adventurer, was born at Venice in 1725, and by the time he reached his twenty-first year had been abbé, secretary to Cardinal Aquaviva, ensign, and violinist in an orchestra, at Rome, Constantinople, Corfu, and his own birthplace, where he gained some celebrity by curing a wealthy senator of apoplexy. His irregularities drove him from Venice, but after roaming through Northern Italy and France he was back there in 1755, and was then condemned to five years' imprisonment in the 'Piombi.' In fifteen months' time he effected a daring escape, and then for nearly twenty years wandered through Europe, visiting most of its capitals (Paris, London, Berlin, St Petersburg, Madrid, &c.), and making the acquaintance of the greatest men and women of the day, from the pope to Madame de Pompadour, and from Cagliostro to Frederick the Great. Alchemist, cabalist, knight of the papal order of the Golden Spur, and spy, he was everywhere introduced to the best society, invariably excited the disgust or ill-will of those about him, and had always to 'vanish' after a brief period of felicity. In 1761 we find him distinctly professing the miraculous after the Cagliostro fashion: he having undertaken to regenerate old Madame D'Urfé into a young man—for a consideration! In 1785 he established himself with the Count of Waldstein, at his castle of Dux in Bohemia, and there he died (apparently) 4th June 1798. His celebrated *Mémoires écrits par lui-même* (12 vols. Leip. 1823-38) contain many interesting notices of the manners of his times, intermixed with details of his marvellous adventures. Clever and cynical, they are unmatched as a self-revelation of scoundrelism; Thackeray's *Barry Lyndon* is but a far-off echo. Translations of the *Mémoires* appeared in 1896 and 1922 *et seq.*, an abridged one in 2 vols. in 1923. See books by E. Maynial (trans. 1911), Le Gras (trans. 1923), and Bleakley (1923).—Two of his brothers were painters—GIOVANNI BATTISTA (1728-95), who in 1764 became director of the Dresden Academy; and FRANCESCO (1727-1805), a battle-painter, born in London.

Casareep, or CASSIRIPE, a sauce or condiment made from the juice of the Bitter Cassava or Manioc root, which also furnishes tapioca. It is in the highest esteem in Guiana, where it is employed to flavour almost every dish; and it is the basis of the favourite West Indian dish called *pepper-pot*. It is a powerful antiseptic, and meat can by means of it be kept for a long time quite fresh, even in a tropical climate. It is made by evaporating and concentrating the juice, which is also mixed with various aromatics. The poisonous principle of the juice is dissipated in the evaporation. See MANIOC.

Casa Santa. See LORETTO.

Casas Grandes, an old Indian town of Mexico, in the state of Chihuahua, 125 miles SW. of El Paso, surrounded with ruins of ancient buildings, which seem to indicate a former population of 20,000 to 30,000.

Casas, LAS. See LAS CASAS.

Casaubon, ISAAC, one of the most famous of the great classical commentators, was born at Geneva on February 18, 1559. His family belonged to Dauphiné. His life was one of incessant study, and he was often hampered in his labours by broken health and narrow means. In his twenty-fourth year he was appointed professor of Greek at Geneva, and in 1586 he married the daughter of the great French scholar, Henri Stephens. He was made Greek professor at Montpellier in 1596, and royal librarian at Paris in 1598. After the death of Henry IV. his position in Paris became insecure on account of his adherence to Protestantism. He accordingly removed in 1610 to London, where he wrote a reply to the *Annals* of Cardinal Baronius, and thereby incurred the charge of having sold his conscience, and become the hired advocate of James I. The accusation was unjust, as he had for many years been unconsciously drawing near to the school of Anglo-Catholic theology. He was made prebendary of Canterbury in 1610; and he died in London on 12th July 1614. He was of a candid and tolerant nature, not gifted with great original powers, but indefatigable in the pursuit of knowledge. He is one of the chief representatives of a school of 16th-century humanists who succeeded to the school of Ciceronians, and with whom wide research took the place of exclusive devotion to style. His treatise *De Satyrica Græcorum Poesi et Romanorum Satira* (1605) and his edition of Theophrastus had far-reaching effects in English and French literature. His other works include *De Libertate Ecclesiastica* (1607), the *Exercitationes contra Baronium* (1614), and editions of Aristotle, Diogenes Laertius, Polybius, Strabo, Theocritus, Athenæus, Persius, Suetonius, &c. Casaubon's power over Greek was limited, but he amassed a wonderfully varied store of learning, and was the first to popularise a connected knowledge of ancient life and manners. His merits as a commentator are best shown in his edition of Athenæus (1600), on which he was engaged for ten years. See *Isaac Casaubon*, by Mark Pattison (1875).—MÉRIC CASAUBON, son of the above, was born at Geneva, August 14, 1599. He accompanied his father to England and studied at Christ Church College, Oxford. He was made prebendary of Canterbury, and vicar of Monckton in Thanet, was deprived of his appointments in 1644, but restored in 1660; and he was ultimately rector of Ickham. He edited the works of Terence, Epictetus, Marcus Aurelius, &c., and vindicated his father in two Latin works. He died at Oxford, July 14, 1671.

Casbin. See KAZVIN.

Cascade Range, a chain of mountains of North America in Oregon and Washington, U.S. (including the Cascade Range Forest Reserve of 7254 sq. miles area), and in British Columbia. It takes its name from the great cascades of the river Columbia, occurring where that stream cañons through the range by a pass 4000 feet deep. The course of the mountain-chain in the United States is from north to south nearly parallel to the Pacific coast-line, and from about 110 to 160 miles distant from it. Southward it is continuous with the Sierra Nevada of California; northward it connects with the unsurveyed range which forms the boundary between British Columbia and Alaska.

The chain throughout most of its course is heavily wooded, chiefly with evergreen conifers, including pines of various species, firs, spruces, cedars, and trees locally known as cypress, larch, juniper, and yew. Southward there is some alder, ash, and maple, and even a little oak. The presence of beautiful cone-shaped and perpetually snow-clad peaks is a most striking feature. There are quite a number of rather low transverse passes which may, in time, become important highways. Near the south end of the range stands Mount Pitt (9760 feet high). Forty miles north is Mount Scott (9127 feet), a mere fragment of a now extinct volcano of enormous dimensions. Its western walls are almost perpendicular. Forty miles still northward, after passing many wonderful old volcanoes and lava-beds, we come to Diamond Peak (8860 feet), which is also the remnant of an old crater-rim. The Three Sisters are of similar character. Mount Jefferson is 10,570 feet high, and Mount Hood 11,760 feet. The principal peaks in Washington are Mounts Tacoma or Rainier (14,530 feet; in eruption in 1894), Adams (12,470), Baker (11,090), and St Helen's (9744 feet). In British Columbia the range comes much nearer the sea-coast.

The Cascade Mountains (at least in Oregon), with the Sierra Nevada, are much more recent than are the Rocky Mountains proper. They were probably formed about the close of the Jurassic period, although the now visible volcanic products seen along the range are of much later, and even quite recent, date; the earliest volcanic fissures being referable to the end of the Miocene period, at which time, or a little earlier, the parallel Coast Range began to be raised.

Cas'cara Sagrada. See BUCKTHORN, CONSTIPATION.

Cascarilla Bark (Span. *cáscara*, 'bark'), the tonic and astringent bark of *Croton Eleuteria*, a small tree growing in the Bahamas, used in making incense (q.v.) and pastilles. The barks of a number of other species of *Croton* appear to possess similar properties, such as *C. Cascarilla* and *C. Balsamiferum*.

Case. See DECLENSION, GRAMMAR.

Case, in law. The most common is the 'case stated' by a magistrate raising some point of law for the decision of the Criminal Court of Appeal. This applies to the whole summary jurisdiction of the justices of the peace in England. Such appeals have been allowed in England since 1857; in Scotland only since 1875. Such cases are also stated by way of appeal under numerous special statutes, as the Registration and Customs and Excise Acts. 'Cases' are also the statements and pleadings lodged by the appellants and respondents in the House of Lords. 'Case' is also applied in the Court of Session to the printed argument which is sometimes ordered in cases of difficulty and importance. By authority of statute the courts in different parts of the United Kingdom consult each other as to points of law by means of adjusted cases. One of the points in the celebrated Orr Ewing litigation was whether the word 'cause' in the Treaty of Union meant an actual litigation, or merely a pending question of liability. In the daily language of the courts a 'case' is a previous decision of a court which is supposed to bear upon the subject of argument. The citation of cases was jealously regulated in the Roman law by Valentinian's Law of Citations; now this is left to custom and tradition. In both England and Scotland, by a valuable reform, parties are now encouraged to agree upon facts, and submit their contentions to the court in the form of a 'special case.'

In the United States, while the word case is, like cause, applied generally to every question contested in court, whether of law or equity, it also retains there, in consequence of the state of legal procedure, a limited meaning—e.g. an action of damages for tort, where the older forms are unsuitable, as an action for negligence against a corporation.

Case-hardening is the process of converting the surface of certain kinds of malleable-iron goods into steel, thereby making them harder, less liable to rust, and capable of taking on a better polish. Fire-irons, gun-locks, keys, and other articles of limited size, are very commonly so treated, but the process is sometimes applied to large objects, such as iron railway-bars. The articles are first formed, and heated to redness with powdered charcoal or cast-iron, the malleable-iron taking carbon from either of these to form a skin of steel upon it; the heated objects are then cooled in cold water, or in oil when they are of a delicate nature. Yellow prussiate of potash or parings of leather have also been a good deal used for coating iron articles with steel by heating them together. Some chemists consider that in this case nitrogen combines with the iron and effects the hardening. The coating of steel is very thin, seldom exceeding $\frac{1}{16}$ th of an inch. A Swedish ironmaster discovered that a very excellent case-hardening is obtained by treating iron or steel objects with a mixture of animal matter, such as rasped leather or horn, and arsenious acid dissolved in hydrochloric acid, and heating as usual.

Casein is an organic compound allied to Albumen (q.v.), found in the milk of the Mammalia. There exists in peas, beans, and other leguminous seeds a similar compound, Legumin. The proportion of casein in Milk (q.v.) varies, but averages about 3 per cent., and it may be coagulated and separated therefrom by the addition of a little Rennet (q.v.), as in the manufacture of Cheese (q.v.), or by the employment of a few drops of a mineral acid, such as dilute sulphuric acid. In either case the casein separates as *curd*, which still retains attached to it some oil and earthy salts, though the greater portion of these substances, along with the sugar, remain in the watery liquid or *whey*. The elementary bodies which enter into the composition of casein, and the proportion in which these are present in 100 parts, are—carbon 53.83; hydrogen, 7.15; nitrogen, 15.65; oxygen, 22.52; and sulphur, 0.85. The properties of casein are, that it is not coagulated by heat, as is well evidenced in the heating of milk, but is coagulated on the addition of rennet; sulphuric, hydrochloric, or nitric acids; alcohol, creosote, or infusion of galls, but not by acetic acid. It also forms insoluble precipitates with solutions of the poisonous salts, acetate of lead, nitrate of silver, and bichloride of mercury (corrosive sublimate), and hence the efficacy of taking large doses of milk in cases of poisoning by those deadly salts, as the casein in the milk, forming an insoluble compound with the poison, keeps it from exerting its deadly powers.

The cognate proteinous or nitrogenous *legumin*, generally procured from leguminous seeds, like peas or beans, can also be extracted from the majority of vegetable substances, especially from sweet and bitter almonds, and even from tea and coffee. Dried peas contain a fourth of their weight of legumin, and this can be extracted by bruising the peas to powder, and digesting in warm water for two or three hours. The liquid is then strained through cloth, which retains the insoluble matters, and allows the water with the legumin dissolved therein, and with starch mechanically suspended, to pass through. On settling, the starch falls to

the bottom of the vessel, and the clear liquid holding the legumin in solution, on the addition of a small amount of acetic acid, yields a precipitate of legumin or vegetable casein. So perfectly does the vegetable casein resemble the casein from milk that the one can hardly be distinguished from the other by chemical tests or by taste. In China and Manchuria a form of cheese is made from beans and peas.

Casein is a most important element of food; see DIET, DIGESTION. But the albumen or casein of skim-milk, formerly wasted except when the milk was used for feeding cattle, is now put to a vast number of extraordinarily different uses. It is desiccated and prepared as a substitute for eggs in baking. It is largely utilised in medicinal preparations—especially for nervous disorders—such as sanato-gen and plasmon. Great quantities are used in sizing paper, and for dressing and finishing leather or leather goods. It serves admirably as 'cold' glue. It is the basis of washable distempers and many paints. Casein heated with chalk forms a compound insoluble in water, which, hardening on exposure to air, makes a strong cement. Prepared as a non-inflammable substitute for Celluloid (q.v.), it is manufactured into imitation ivory, piano-keys, backs of brushes, insulating material for electric fittings, and put to other uses too numerous to specify.

Casemat, originally a loopholed gallery, since called a 'caponier,' from which, without risk of loss to themselves, the garrison of a fort could fire upon an enemy who had obtained possession of the ditch. The term is now applied to any bomb-proof vaulted chamber, in permanent or field fortification, even when used as quarters for the garrison or for covering guns, magazines, stores, or hospitals from high-angle or vertical fire. See FORTIFICATION.

Caserta, a town of Italy, situated on a plain 20½ miles NNE. of Naples by rail. It is chiefly remarkable on account of its magnificent palace, one of the finest in Europe, which was founded by Charles III. of Naples in 1752, and for its 12th century cathedral. Silk is manufactured in the neighbourhood. Pop. 33,500. The province of Caserta has an area of 2000 sq. m., and a pop. (1911) of about 788,400.

Cases, Las. See LAS CASES.

Case-shot, or CANISTER, is an artillery projectile for use at close quarters, and consists of a sheet-iron or tin cylinder filled with bullets varying from $\frac{1}{4}$ an oz. to 3½ lb. in weight, and in number according to the size of the gun. The cylinder is closed by discs of wood, tin, or iron, its walls are strengthened by loose pieces of iron, and the interstices between the balls are packed with shavings and sawdust. On discharge the canister breaks up at once, and the bullets spread over a wide area, but with a low velocity. For this reason they have little effect beyond 300 yards, even on hard open ground, which is best suited to their action. Case-shot is chiefly used in the close defence of works, or against cavalry, and at sea against a boat attack. At long ranges its place is taken by Shrapnel Shell (q.v.).

Cash (old Fr. *casse*, 'a chest for containing money') is sometimes used for money as distinguished from produce, in which sense it includes all immediately negotiable paper—bills, drafts, and bonds, as well as coin and bank-notes. At other times it is used in a limited sense to denote coin and bank-notes, as distinguished from negotiable instruments which pass by indorsement. In the money system in use at the Chinese Treaty ports, *cash* is the name of those coins, of a copper alloy, which are perforated and strung on a thread;

this word is derived from the Tamil *kasu*, a small Indian coin. See TAEL.

Cash Account, or CASH CREDIT, a form of account with a bank, by which a person is entitled to draw out sums as required by way of loan to a stipulated amount. The practice began about 1729 in Scotland, with the banks of which country it is still peculiarly identified. See BANKING, MARGINAL CREDIT.

Cashel, a town of Ireland, in County Tipperary, 100 miles SW. of Dublin and 5 miles SE. of its railway station. It is the see of a bishop of the Episcopal Church, and of a Roman Catholic archbishop. It is irregularly built on the south and east slopes of an isolated height, rising abruptly from a rich and extensive plain. It was a parliamentary borough till 1870, and possesses a barrack, infirmary, and market-house. The ancient kings of Munster resided here. The top of the height, or 'Rock of Cashel,' which rises to about 300 feet, is occupied by an assemblage of the most interesting ruins in Ireland. The ruins consist of a cathedral, founded 1169, burned 1495, and afterwards repaired; a stone-roofed chapel, said to have been built 1127 by Cormac MacCarthy, king of Munster; the palace of the Munster kings; a round tower, 90 feet high and 56 in circumference; and an old cross. At Cashel in 1172 Henry II. received the homage of the king of Limerick, and here he called a council of the clergy, at which decrees were passed for the regulation of the church. Pop. 2800

Cashew Nut (*Anacardium occidentale*), a tree of the Anacardiaceæ (see TEREBINTH), cultivated in both the East and West Indies. It is a spreading tree of no great height. It abounds

Cashew Nut (*Anacardium occidentale*).

in a clammy, milky juice, which turns black on exposure to the air, and is used in India for varnishing, but is so acrid as to produce painful inflammation of the skin. The fruit of the tree is a kidney-shaped nut, about an inch long, seated on the thicker end of a pear-shaped fleshy stalk. The kernel is also surrounded by black acrid oily juice, but is itself pleasant and wholesome. The nuts were formerly sometimes put into old Madeira wine, and are roasted as an addition to chocolate. The fleshy stalk, sometimes called the Cashew Apple, varies in size from that of a cherry to an orange, and is white, yellow, or red. It is perfectly free from acidity, very pleasant, acid, and refreshing. A kind of wine is obtained from

it by fermentation; and from this a well-flavoured spirit can be distilled. A bland gum resembling gum-arabic also exudes from the stem.

Cashgar. See KASHGAR.

Cashiering is a punishment for officers in the army and navy. It is more severe than dismissal, inasmuch as it disqualifies from entering the public service in any capacity. An officer convicted by court martial of 'scandalous conduct unbecoming an officer and a gentleman' is cashiered.

Cashmere. See KASHMIR.

Cashoubish. See KASHUBISH.

Cash Registers. See CALCULATING MACHINES.

Cassia, perhaps *Osyris alba*, a South European shrub of the order Santalaceæ, with pretty little yellow flowers and small red drupes. Others think the Latin poets meant *Daphne Gnidium*. The name is simply a variant of Cassia (q.v.).

Casilinum. See CAPUA.

Casimir, properly Kazimierz, the name of a number of Polish kings. See POLAND.

Casimir-Périer, JEAN PIERRE PAUL (1847-1907), fifth President of the French Republic, was the son of C. Périer (q.v.), and was born at Paris. He was trained for a political career, but in 1871 was made a Chevalier of the Legion of Honour, for military services rendered during the siege of Paris. Elected a deputy in 1874, and distinguished as a moderate republican of great firmness of character, he was successively under-secretary for instruction and for war, vice-president of the Chamber (1885-93), and president of the Chamber (1893). Premier of France for six months in 1893-94, he was again president of the Chamber, when, on the assassination of M. Carnot (June 1894), he was called to become President of the Republic—an office he resigned in January 1895.

Casino, an Italian diminutive of *casa*, 'a house,' signifies a place for social reunions. The name is usually applied in Italy and the continental watering-places to a place where musical or dancing soirées are held, containing rooms for conversation, billiards, refreshments, &c. In England a dancing saloon is sometimes termed a casino.

Casket. See COFFIN. For the Casket Letters, see MARY, QUEEN OF SCOTS. For the islands called Caskets, see ALDERNEY.

Cáslav. See CZASLAU.

Casoria, a town of Italy, 6 miles N. of Naples by rail; pop. 10,000.

Caspa'ri, KARL PAUL, exegete and church historian, born at Dessau in 1814, became professor of Theology at Christiania in 1857. His Arabic grammar (4th ed. Halle, 1875) is in high repute, and his contributions to the study of the old Testament include works on Obadiah, Isaiah, Micah, and Daniel. Besides his *Kirchenhistorische Anekdoten* (1883), he published at Christiania *Quellen zur Geschichte des Taufsymbols und der Glaubensregel* (2 vols. 1866-69), extensions of which appeared in 1875 and 1879. He died 11th April 1892.

Caspe, a town of Spain, 53 miles SE. of Saragossa; pop. 8000.

Caspian Sea, an inland sea or great salt lake, the largest in the world, on the boundary between Europe and Asia, extending from 36° 40' to 47° 20' N. lat., and 46° 50' to 55° 10' E. long. Its length from north to south is 680 miles, and its breadth varies between 130 and 270 miles. Its total area is estimated at 170,000 sq. m. The coast-line is irregular, and on the east side especially there are several bays and indentations of coast, the principal being those of Mertviy Kultuk (with the bay Kaidak), Kenderli (separated from the above by the

peninsula of Manghishlak), Karabugas, and Balkhan. From the west, the naphtha-impregnated peninsula of Apsheron stretches into the Caspian opposite the Balkhan Gulf and Cheleken Island (also possessing petroleum-wells); Mount Caucasus also rises on its west side. Along the almost unbroken south coast extends a low flat plain from 15 to 20 miles in breadth, and beyond that the lofty Elburz Mountains. On the north the Caspian is bordered by great steppes, the surface of which is below that of the ocean, and the country eastward is occupied by the desert plateau of Ust-urt and the sandy deserts of the Turkomans. During the Post-Pliocene period the waters of the Caspian extended in the shape of a wide gulf north, towards the mouth of the Kama (q.v.), and through a narrow strait between the Balkhan Mountains, over the steppes of the lower Amu-Daria, embodying Lake Aral, whose level at the beginning of the 20th century (*circa* 160 feet above sea-level) was some 250 feet higher than the Caspian's. At a still earlier period it was connected with the Black Sea by the channel of the two Manytch rivers (see CAUCASUS). The Caspian Sea has no tides, but its navigation is dangerous because of violent storms, especially from the south-east. Owing to the variable amount of water brought by its tributaries and the extent of evaporation, its level rises and falls from season to season (highest in July; lowest, December-January) and from period to period. Since 1896, and notably after 1909, it has fallen (for investigations of Prof. Shokalski, see *Journal de Géographie*, March 15, 1914). It is very shallow in the north, where a depth of 14 feet is reached only at a distance of no less than 10 miles, and that of 12 fathoms (72 feet) at a distance of 130 miles from the mouth of the Volga. In its middle it is intersected by a submarine ridge which continues the main Caucasus chain from the Apsheron peninsula towards the ESE. The greatest depth found in the northern basin is 2526 feet, and in the southern (close by the southern shore) 3096. The Caspian receives the waters of a number of large rivers—the Volga, Ural, Emba, Terek, Kura, and Atrek. Its salinity (mostly from 1 to 1.5 per cent., but far more in the bays) is much less than that of the ocean. The northern parts are covered with ice during winter. Very valuable fisheries are carried on, especially for sturgeon and salmon. Besides many species of its own, it has several species of fish in common with the Black Sea, the Arctic Ocean, and Lake Aral; this suggests that the separation of the Caspian from the Black Sea took place in the early part of the Post-Pliocene period, or perhaps during the Pliocene. By the Volga and its canal system the Caspian is united with the Baltic and White Seas. The southern shore remains Persian. Balfrush, Reshd, and Astrabad are Persian towns on or near the coast. The other chief towns upon its shores are Astrakhan, Derbend, Baku, and Krasnovodsk (q.v.), whence the Transcaspiian railway runs by Askabad, Merv, Bokhara, Samarkand, and Khokand to Andijan. Steamers ply between Krasnovodsk and Baku, which is connected by rail with the Black Sea. The Orenburg-Samarkand railway *via* Tashkand has diverted some of the Transcaspiian traffic.

The Caspian Sea was known to the Greeks and Romans. According to Strabo, it derived its name from the Caspii, a tribe inhabiting its western shores. The name Caspiian was afterwards limited to the western portion of the lake—the eastern being designated the Hyrcanian Sea.

Casque. See ARMOUR.

Cass, Lewis, American statesman, born at Exeter, New Hampshire, 9th October 1782. He was admitted to the Ohio bar in 1803, but in 1812,

on the outbreak of the second war with Great Britain, entered the army, and rose rapidly to the rank of general. Left in command of Michigan at the close of the war, he was for eighteen years civil governor of the territory which under his skilful administration became a settled and civilised state. From 1831 to 1836 Cass was Secretary of War under General Jackson, and from 1836 to 1842 he was United States Minister at Paris. In 1844 he was much spoken of for the presidency, and in 1848 he received the Democratic nomination, but was defeated at the polls by General Taylor; in 1852 he again lost the nomination. He sat in the senate from 1845 to 1857, when he was appointed Secretary of State, resigning office in 1860 in consequence of President Buchanan's refusal to reinforce Fort Sumter. He now retired from active life, and died at Detroit, 17th June 1866. Scrupulously honest, and generally a prudent and cautious legislator, Cass's position on most questions of his time resolved itself into one of compromise and moderation. His attitude towards slavery was inconsistent, but he appears to have sympathised with the Union in the civil war. For Britain he evinced a bitter hostility. He published a work on the history and languages of the United States Indians (1823), and *France: its King, Court, and Government* (1840). See Lives by W. L. Smith (1856) and A. C. McLaughlin (1891).

Cassagnac, Adolphe Granier de, French journalist, born in the department of Gers in 1806, in 1832 came to Paris, where he was employed on several journals, and where his vehement style of writing soon brought him considerable prominence and a number of duels and law-suits. In 1840 he visited the Antilles, in hopes of political preferment, and there married a Creole lady, Mademoiselle Beauvallon. 'Until 1843 a zealous Orleanist, he became one of the earliest promoters of the empire, and a bitter assailant of his former patrons, and as a supporter of the government, represented his native department from 1852 to 1870. He founded several papers, of all shades of political and religious thought, and chiefly resembling one another in their early demise; ultimately he became the chief editor of the semi-official *Le Pays*, which he revived after the fall of the empire. He died 31st January 1880. His appearances before the courts of justice were numerous, in his earlier years for duelling, and afterwards in cases of libel and debt. He published two romances and a number of compilations.—His son, PAUL ADOLPHE MARIE, born in 1843, joined him on *Le Pays* (1866), assisting with the literary work, and assuming charge of the duelling department of the paper. Having joined a Zouave regiment in 1870 as a volunteer, he was captured at Sedan, and imprisoned for some time in Silesia. He returned to Paris in 1872, renewed his association with *Le Pays*, and violently advocated the imperialist cause. In 1876 he was elected a deputy, and engaged in a course of turbulent insolence and obstruction; he was imprisoned in 1877, and during the autumn openly but vainly urged MacMahon to a *coup d'état*. The death of the Prince Imperial in 1879 disconcerted Bonapartist hopes; and his support of Prince Victor Napoleon introduced dissensions. He founded a Victorist organ and conducted it till his death, 4th November 1904. Of his works a *Life of Napoleon III.* was popular.

Cassander, king of Macedonia, was born about 354 B.C. His father, Antipater, passed him over and bequeathed the regency to Polyperchon, but Cassander allied himself with Ptolemy and Antigonus, and entered on a struggle with his rival. In 318 he gained Athens and most of the Greek cities, next invaded Macedonia,

captured Pydna, and put to death Olympias, mother of Alexander, but spared his widow Roxana and her son *Ægus* for several years. Meanwhile he married Thessalonica, half-sister to Alexander, in whose honour he founded, about 316 B.C., the town which bears her name. In the following year he caused Thebes, which Alexander had destroyed, to be rebuilt. He next joined Seleucus, Ptolemy, and Lysimachus in their long struggle with Antigonos, which ended with the death of the latter on the battlefield at Ipsus (301). In 306 Cassander had assumed the title of king. He died about 297, leaving his son Philip as his successor.

Cassandra, according to Homeric legend, was the fairest daughter of Priam and Hecuba, and the twin-sister of Helenus. The two children were left one night in the sanctuary of Apollo, and during their sleep their ears were touched and purified by two snakes, so that they could understand the meaning of the language of birds, and thus know the future. Cassandra afterwards attracted the love of Apollo by her beauty, and he taught her the secrets of prophecy; but displeased by her rejection of his suit, laid upon her the curse that her prophecies should never be believed. So she prophesied in vain the treachery of the Grecian horse and the destruction of Troy, and was looked on by the citizens as a mere mad woman, whose words had no value whatever. On the capture of the city she fled to the temple of Athena, but was torn from the altar by Ajax Oileus, and ravished in the temple. In the distribution of the spoil she fell to the share of Agamemnon, and was afterwards murdered by Clytemnestra. The name is now often used generically of one who takes gloomy views of the political or social future, as the late W. R. Greg in his book, *Rocks Ahead, or the Warnings of Cassandra*.

Cassandra, the most western of the three tongues of the Chalcidice peninsula, between the gulfs of Salonica and Cassandra. Its ancient name was *Pallene*. The Gulf of Cassandra (ancient *Toronaicus Sinus*) extends 35 miles north-westward, and is 8 to 16 miles broad.

Cassano, a town of Southern Italy, 34 miles N. of Cosenza; pop. 8000.—**CASSANO**, on the Adda, 16 miles ENE. of Milan by rail, was the scene of two sanguinary battles—a defeat in 1705 of the Imperialists under Prince Eugene, by the French under Vendôme; and a defeat in 1799 of the French themselves under Moreau, by the Russians and Austrians under Suwaroff. Pop. 5000.

Cassation, **COURT OF**. In the law of France, the act of annulling the decision of a court or judicial tribunal is called *cassation*, from the verb *casser*, 'to break or annul' (Lat. *quater*; Eng. *quash*); and the function of cassation, as regards the judgments of all the other courts, is assigned to a special tribunal called the *Cour de Cassation*, which may thus be regarded, in a certain sense, as the last and highest court of appeal. But as everything is excluded beyond the question whether or not the view taken of the law, and of the proper method of administering it by the inferior tribunal, has been the right one, the idea attached to this institution is less that of a court in the ordinary sense, than of a department of government to which the duty of inspecting the administration of justice is assigned. The demand for cassation can be made only by the parties to the suit, or by the *procureur-général* of the Court of Cassation for the public interest. The decisions of other French courts, civil, commercial, and criminal, may be reviewed by the Court of Cassation, with the exception of decisions in the adminis-

trative courts and the judgments of a *juge de paix* (where the amount is less than 100 francs), and of tribunals of commerce (where the amount is less than 1500 francs). These appeals do not involve any stay of execution, and the judgment in cassation is not a judgment on appeal, but merely has the effect of quashing the judgment below. The delay allowed for bringing a civil case before the Court of Cassation is two months for persons domiciled in France; but parties resident out of France have further time. In criminal matters the procedure is greatly more prompt, three full days only being allowed. In all criminal and police cases the Court of Cassation may pronounce judgment immediately after the expiry of these days, and must do so within a month. The court consists of a president, three vice-presidents, and forty-five counsellors or ordinary judges. Its ministerial staff consists of a *procureur-général* and six advocates-general, as well as several inferior officers. The judges of the Court of Cassation are appointed by the President of the Republic, and their appointments are irrevocable. The three sections of the court are the *Chambre des Requêtes*, the *Chambre Civile*, the *Chambre Criminelle*. The whole court, when presided over by the minister of justice, possesses also the right of discipline and censure over all judges for grave offences not specially provided for by the law.

Cassava, a West Indian name of the plant also called Manioc (q.v.), and of the starch produced from it, which is otherwise called Brazilian Arrowroot, and is popularly known in Britain as Tapioca (q.v.).

Cassay. See MANIPUR.

Cassel, or **KASSEL**, chief town of the Prussian province of Hesse-Nassau, and the old capital of the former electorate of Hesse-Cassel, is pleasantly situated on both sides of the navigable Fulda, 120 miles by rail NNE. of Frankfurt-on-Main, and 233 WSW. of Berlin. Pop. (1875) 53,043; (1919) 162,391. The town is one of the most attractive provincial capitals in Germany. Its oldest part consists of a few very narrow, crooked streets, close to the river; the more modern parts are situated on gentle hills. The 'upper new town' was founded by French refugees in 1688. Cassel is partially walled. In the *Friedrichs-Platz*, a square of great size, stand the palace of the old Electors, a comparatively mean structure, the military school, and the large *Museum Fridericianum*, erected in 1769-79, which contains a library of 200,000 volumes and some valuable MSS., besides collections of plaster-casts, antiquities, coins, &c. The large new law-courts were erected in 1880 on the site of the *Kattenburg*, a costly and ambitious palace projected in 1820, which, however, remained unfinished from 1821 till 1869, when its materials were used in the construction of the new picture-gallery. The latter, opened in 1877, contains about 1400 paintings, including some excellent specimens of Dutch and other old masters. Cassel has an observatory, and is the seat of a number of learned and scientific associations. It carries on manufactures of locomotives and steam-engines, carriages, philosophical and mathematical instruments, cotton and linen fabrics, plate, and sugar. Cassel is the birthplace of the chemists Bunsen and Kolbe; the brothers Grimm here wrote their famous fairy-tales between 1806 and 1814; and Spohr conducted the orchestra of the theatre from 1822 till 1859. Cassel appears to have existed as early as the 10th century under the name of *Chassala*. From 1807 to 1813 it was the capital of the kingdom of Westphalia. The gardens of *Wilhelmshöhe* (1787-96)—which was assigned to Napoleon III. as a residence after

his fall at Sedan, in September 1870—with their splendid fountains and cascades, and the colossal statue of Hercules, within the hollow of whose club eight persons can stand at one time, are three miles from Cassel.

Cassell, JOHN, founder of the publishing firm of Cassell & Co., the son of a Manchester inn-keeper, was born 23d January 1817. He had but a poor education, but while an apprentice joiner, by careful self-culture, fitted himself for the post of a temperance advocate. He went to London in 1836, and was settled as a tea and coffee merchant in 1847, but soon after turned author and publisher, issuing his *Working Man's Friend* (1850), *Illustrated Exhibitor* (1851), *Popular Educator* (1852), the most popular of all his works, which in a revised form is still on sale; and *Family Paper* (1853). In 1859 he entered into partnership with Messrs Petter & Galpin, and before his death, on 2d April 1865, he had the satisfaction of witnessing, and sharing in, the prosperity of one of the largest book-factories of modern times.

Cassels, WALTER RICHARD (1826–1907), author, followed commercial pursuits in India, and in 1863 was elected a member of the Legislative Council of Bombay. He retired in 1865 and devoted himself to literature. In addition to his *Supernatural Religion*, which appeared in 1874, and of which a revised edition was published in 1902, he was the author of *Cotton and its Cultivation*.

Cassia, a name given by the ancients to a kind of aromatic bark identified with the Cassia Bark or *Cassia lignea* (sometimes also China Cinnamon) of our shops, and referred to *Cinnamomum Cassia*. It is essentially a cheaper and coarser form of Cinnamon (q.v.), for which it forms an excellent substitute—its essential oil being chemically similar, although more or less inferior in fragrance and flavour.

CASSIA BUDS are the immature fruit of the same tree, and have been imported from China since the middle ages: in Southern India a very inferior variety is also produced. The leaves of other species of *Cinnamomum* are variously used in Mysore; while in Peru and Ecuador the large woody calyx of a lauraceous tree (*Nectandra* sp.) serves the same purpose. The 'white cinnamon' of the West Indies is *Canella Bark* (q.v.).

CASSIA is also the botanical name of a large genus of Leguminosæ (sub-order Cæsalpinieæ), trees, shrubs, and even herbs. Some are cultivated on account of their graceful foliage and handsome yellow flowers; their chief importance is, however, medical, the leaves of several species furnishing Senna (q.v.), while the drug known as Cassia Fistula or Purging Cassia is derived from the pod of *Cassia Fistula*, of which the bark is used in tanning, and also yields a yellow dye. The name, however, in ancient writers clearly applies to a tubular bark, no doubt some variety of the spice Cassia above mentioned (q.v.). For *Poet's Cassia*, see **CASIA**.

Cassianus, JOANNES EREMITA, or JOANNES MASSILIENSIS, an early monk and theologian, born most probably about 360. He spent some years among the ascetics of the Egyptian deserts, was ordained by Chrysostom at Constantinople in 403, and afterwards instituted monastic life in Provence, in the south of France. Shortly before 415 he founded at Massilia two monasteries according to the rules laid down in his *De Institutis Cœnobiorum*. One of these monasteries was for nuns; the other was the famous Abbey of St Victor, which under its founder is said to have possessed not less than 5000 inmates, and which served as a model to a multitude of monastic institutions in Gaul and Spain. He died about 448, and was afterwards canonised, his festival falling on 25th July. In his writings Cassianus appears as the opponent of the

extreme dogmas of St Augustine respecting grace and free-will. His *Collationes Patrum Sceticorum* is a work in 24 chapters, each of which gives a 'spiritual colloquy between monks in the desert of Sketis,' regarding the monastic life and the vexed questions of theology. Cassianus was one of the first of the 'semi-Pelagians' rejecting the extreme view taught by St Augustine of man's worthlessness and natural incapacity for good; his views being substantially identical with what was long afterwards known as Arminianism.

See the edition by Gazzeus (1616), and the Life and translation by Gibson (1895).

Cassican (*Cassicus*), a genus of American birds allied to starlings, and yet more closely to the Hang-nests or Icteridae. They exhibit marvellous skill in knitting together the shreds, &c., which form their hanging nests. See BALTIMORE BIRD, HANG-NESTS.

Cassidaria, a genus of molluscs—class Gastropoda (q.v.), order Prosobranchiata, family Cassidæ. The shell is roughly oval, with a wide mouth, a fairly long siphon canal, and without a closing lid. There are six modern Mediterranean species, and five times as many extinct in the Upper Chalk and Tertiary strata. See HELMET-SHELL.

Cassi'ni, the name of a family distinguished for their services in astronomy and geography.

GIOVANNI DOMENICO CASSINI, born at Perinaldo, near Nice, 8th June 1625, studied at the College of Jesuits, Genoa, and at Bologna, where in 1650 he was appointed to the astronomical chair. His first work related to the comet of 1652. He subsequently devoted himself to the determination of astronomical refraction and of the sun's parallax, &c. In 1664–65 he determined the period of Jupiter's rotation. Subsequently he determined the periods of the planets Mars and Venus, and made a near approximation to the parallax of the sun. He discovered four of the satellites of Saturn, as well as the dual character of that planet's ring, and was the first who carefully observed the zodiacal light; he also demonstrated that the axis of the moon was not (as had been believed) at a right angle to the ecliptic, and explained the cause of the phenomenon known under the name of lunar libration. He had an important share in the Meridian (q.v.) measurement begun in 1669. After a long life devoted to painful observations that ultimately deprived him of sight, he died September 14, 1712, at Paris, whither he had gone in 1669, at the invitation of Colbert, to take charge of the observatory erected by that minister.

JACQUES CASSINI, his son, born at Paris, February 18, 1677, was elected a member of the Academy of Sciences in 1694, travelled in Italy, Holland, and England, where he formed the acquaintance of Newton, Halley, Flamsteed, and others, and was elected a member of the Royal Society. He succeeded his father as director of the observatory at Paris, and died April 16, 1756. He wrote several treatises on electricity, the barometer, and astronomical subjects, &c.—His son, CÉSAR CASSINI (1714–84), was also engaged in scientific pursuits.

Cæsar's son, JEAN DOMINIQUE, COMTE DE CASSINI, born at Paris, June 30, 1748, succeeded to the charge of the observatory, and completed in 1793 the great topographical map of France begun by his father. He subsequently became a member of the Institute. He died October 18, 1845.

Cassinio. See MONTE CASSINO.

Cassiodorus, MAGNUS AURELIUS, a Latin statesman and historian to whom we owe most of our information respecting the Gothic kingdom of Italy, was born at Scyllaceum (Squillace) in Calabria

in 468 A.D. He belonged to a noble family, and became secretary to the great Ostrogothic king, Theodoric. He held the offices of quæstor and prætorian prefect, was sole consul in 514 A.D., and after the death of Theodoric in 526 A.D. acted as chief minister to Queen Amalasontha. He was an able and broad-minded statesman, to whom the success of Theodoric's policy must be in part ascribed. He seems to have retired from public life not later than 540 A.D., and to have spent the last thirty years of his long life in Calabria, where he died about 568 A.D. Cassiodorus wrote a history of the Goths (*De Rebus Geticis*), which we only possess in the form of the epitome made of it by Jornandes. His other work, *Variarum Epistolarum Libri XII.*, consists of a collection of the letters which he wrote as secretary to the Gothic sovereigns. They have no literary merit, but the style is bombastic and exceedingly diffuse, but their historical value is of the highest. They form, says Dean Milman, 'a rare collection of original official documents, which admit us, as it were, to the council-board of the cabinet at one of the most interesting of all periods of history.' They shed a flood of light on the policy pursued by Theodoric and his successors, the condition of the people, the affairs of the church, and the fiscal and administrative system of the Gothic kingdom of Italy. An edition of the letters was published in 1679 (2 vols. folio, Rouen). See Hodgkin's *Letters of Cassiodorus; a condensed translation* (1886).

Cassiopeia, the *Lady in her Chair*, a constellation in the northern hemisphere, near Cepheus, and not far from the north pole, named after the mother of Andromeda. It is marked by five stars of the third magnitude, forming a figure like a W. In the year 1572 there all at once appeared in Cassiopeia a new star, which when first noticed by Tycho Brahe exceeded in brightness all the fixed stars, and nearly equalled Venus. The star gradually diminished in lustre, and disappeared in March 1574.

Cassiquiare, or CASSIQUIARI, a river of Venezuela, South America, forming the south bifurcation of the Orinoco, which it leaves in 3° 10' N. lat., 66° 20' W. long., and after a rapid south-west course of about 130 miles, joins the Rio Negro in 2° 5' N. lat., 67° 40' W. long. near San Carlos. By means of this singular river, water-communication is established, through the Amazon, Orinoco, and their affluents, between the interior of Brazil and a large tract in Venezuela.

Cassis, a genus closely allied to Cassidaria, with a shorter siphon canal and with a closing lid. It is a much larger genus, with 42 living species, but with fewer (25) known fossils in the Tertiary epoch. Some large species are used for cameos. See HELMET-SHELL.

Cassiterides, the 'Tin Islands,' first merely mentioned by Herodotus, where the merchant-sailors of Carthage bartered their wares for tin. The Greek *kassiteros*, 'tin,' is the Sanskrit *kastira*, and it has been supposed that the Phœnicians brought the name with the metal from the islands off the coast of India. The islands appear on Ptolemy's map as off north-western Spain, but they were afterwards identified with the Scilly Islands, or with Cornwall; with the little islands about Vigo Bay, off the Spanish coast (Elton); and, by Sir John Rhys, Reinach, and others, with the British Islands themselves—for which, perhaps, Cassiterides is a (modified) Celtic name.

Cassiterite, oxide of tin or common tin ore, occurs massive or in the form of crystals, which are often quadrangular prisms terminated by four-sided pyramids. It appears, however, in many other complex crystalline forms. These are gener-

ally blackish brown or black, but greenish shades are also met with—the dark varieties being opaque, while those that are lighter in colour are somewhat translucent. Cassiterite contains about 78 per cent. of tin, and is the ore from which most of the tin of commerce is obtained. It has been worked from a very remote period in Cornwall, and is met with in many other countries, as in Brittany, Bohemia, Saxony, Spain, Finland, Sweden, Greenland, United States, Mexico, Chili, Sumatra, Malay Peninsula, Australia, &c. *Stream tin* is the name given to rounded fragments of cassiterite found in alluvial deposits in Cornwall, Malay Peninsula, &c.

Cassius, the name of a famous Roman *gens*, which, originally of patrician rank, afterwards became plebeian. Its most famous members were (1) SPURIUS CASSIUS VISCCELLINUS, who was thrice consul, first in 502 B.C., and the promoter of the first agrarian law at Rome (486). By this he made himself so hateful to his own order that they found means to condemn him to death on a trumped-up charge of aiming at regal power.—(2) CAIUS CASSIUS LONGINUS, the most active of the conspirators against Cæsar. He distinguished himself by his conduct as quæstor to Crassus in the Parthian war, and still more greatly by his energy and resource in the disasters that followed his general's death. He was tribune of the people at the breaking out of the civil war, and at once attached himself to Pompey. After the disaster of Pharsalia he was taken prisoner in the Hellespont by Cæsar, and pardoned with that conqueror's usual magnanimity. In 44 B.C., through the influence of Cæsar, he was made prætor, and was promised the governorship of Syria in the following year. But his mean and jealous spirit could not endure the burden of gratitude imposed upon him by the generosity of the dictator, and he resolved to be released by the murder of his benefactor. He first attached to himself the mutinous spirits among the subjugated aristocracy, and next won over M. Brutus. The pseudo-patriotic conspiracy was soon matured, and on the 15th of March 44 B.C. Cæsar fell by the daggers of his assassins. But popular feeling blazed out against the murderers, and Mark Antony had the wit to seize his opportunity. Cassius fled to the east, made himself master of Syria, then united his forces with those of Brutus, and after cruelly plundering Asia Minor, crossed the Hellespont into Thrace. At Philippi the division commanded by Cassius was totally routed, and Cassius, supposing that all was lost, compelled his freedman to kill him.—For another Cassius Longinus, see LONGINUS.

Cassius. See DION CASSIUS, and PURPLE.

Cassivellaunus, a British chief who fought against Cæsar during his second invasion of the island, 54 B.C. The chief of the Cassi, he had seized the sovereignty of the 'Trinobantes,' and had a great reputation as a warrior, but his capital was taken by the Romans, and he himself compelled to flee. He afterwards sued for peace, which he obtained on condition of paying tribute and giving hostages.

Cassock, a long loose robe or outer coat, formerly in common wear, but now worn only by the clergy and choristers. As worn by the clergy of the Church of England it is a long coat with a single upright collar. Black is the common colour for all orders of the clergy. In the Roman Catholic Church cassocks vary in colour according to the dignity of the wearer—priests wearing black, bishops purple, cardinals scarlet, the pope white.

Cassowary (*Casuarus*), a genus of running birds (Ratidae), nearly allied to the Emu (*Dromæus*), with which they agree in having the body-feathers provided with an after-shaft as long as the shaft, in having the 'fingers' of the much-

reduced wing represented by one claw-bearing digit, and in having three toes. The top of the head bears a horny, brightly coloured helmet; the neck is usually ornamented with bright wattles; the wing has its feathers reduced to five or six; the inner toe has a long sharp claw. Cassowaries live in forests and scrub, and feed on soft parts of plants; they have great powers of running and leaping, and also of swimming. They kick forwards when attacked, and strike with the rigid barbs of the degenerate wing. Their cry is 'a loud, harsh, quickly repeated guttural sound audible at a great distance.' Three to six greenish eggs are laid

Cassowary (*Casuarus galeatus*).

among fallen leaves and rubbish, and are incubated (for about seven weeks) by the male, who also tends the young birds. Nineteen species are known, and their geographical distribution is very interesting. One occurs on the mainland of Australia, seven in New Guinea, and the remaining eleven on as many separate islands which apparently represent parts of the original New Guinea. This probably illustrates isolation as a factor in evolution. The flesh of the cassowary is dark in colour, tough and juiceless. The skin is used by the natives in making mats and ornaments. See EMU, OSTRICH; and a book by Hon. W. Rothschild (1900).

Cast, an object formed by pouring molten or liquid material into a mould, in which the substance sets or hardens, assuming the form and outlines of the mould. The process has a very wide application in the arts, its principal utilisation being in connection with the metallic industries. Casting on the large scale, specially in connection with iron and brass work, including statuary, is known as Founding (q.v.), though the products are still termed castings. So also the process of casting types is called typefoundry. But when small objects in metal are dealt with, as in the jewellery trade, the process is known simply as casting. Plaster of Paris is an important medium for obtaining the first permanent casts of artistic sculptures and mouldings from the clay models of artists, as well as for preparing copies of sculptured works. In the same way the moulded ornaments used by plasterers are also prepared in plaster of Paris (see GYPSUM). Casts from plaster moulds are also made in wax for models of fruits, human masks, and other subjects. Casting is further employed in glass manufacture, in which moulded and cast ornaments and forms are precisely analogous to castings in other media. When the material employed in obtaining an impression from a mould is

of doughy consistence requiring to be kneaded in the process, it is known as moulding, and that forms an important feature in the pottery manufacture.

Castagno, ANDREA DEL (1390-1457), a Florentine painter, born in the Mugello. A baseless tradition that he murdered his rival, Domenico Veneziano, long prevailed.

Castaldi, PAMFILO, a scholar, born 1398 at Feltre, Lombardy, by some accounted the inventor of printing with movable types. See Fumagalli's *La Questione di P. Castaldi* (1891).

Castalia, a fountain on the slope of Parnassus, a little above Delphi, in Phocis, sacred to Apollo and the Muses. All who visited the Delphian temple were wont to bathe their hair *rore puro Castalie* ('in the pure dew of Castalia'), but those who needed to be purified from murder bathed their whole body. Its waters, moreover, gave poetic inspiration to those who drank. The name was due to Castalia, daughter of Achelous, who threw herself into the fountain to escape the pursuit of Apollo.

Castamouni. See KASTAMUNI.

Castanea. See CHESTNUT.

Castanets, a musical instrument of percussion in the form of two hollow shells of ivory or hard wood, which are bound together by a band fastened on the thumb, and struck by the fingers to produce a trilling sound in keeping with the rhythm of the music. The *krotalon* used in the worship of Cybele and Dionysus was somewhat similar. The castanets were introduced into Spain by the Moors, and are much used as an accompaniment to dances and guitars.

Castañas, DON FRANCISCO XAYER DE, Duke of Bailen, a celebrated Spanish general, was born at Madrid in 1756, and studied military tactics in Germany. On the invasion of the country by Napoleon, he received the command of a division of the Spanish army, and in July 1808 compelled 18,000 French, under General Dupont de l'Étang, to surrender at Bailen, but was in his turn defeated by Lannes in November of the same year at Tudela. Under Wellington he served as general of the 4th Spanish *corps d'armée*, and took part in the battles of Albuera, Salamanca, and Vittoria. In 1815 he was placed at the head of the Spanish army for the invasion of France, which was rendered unnecessary by the victory at Waterloo. In 1825 he was called to the state council, where he became a decided opponent of the Carlist party. He died, aged ninety-six, on 24th September 1852.

Caste, a term applied chiefly to distinct classes or sections of society in India, and, in a modified sense, to social distinctions of an exclusive nature among other nations. Such distinctions existed in ancient states, as in Persia and Peru (not Egypt), and still exist in Polynesia and elsewhere; but it is with India that we more especially associate the idea of caste. There the system has received its fullest development, and the mass of the population is divided into innumerable classes, the Hindu name for which is *jāti*, a race or class. This term the Portuguese rendered by their equivalent *casta*, whence comes the English *caste*.

When the Aryan race penetrated into India, the conquerors distinguished themselves from the non-Aryan population by the epithet *twice-born*—i.e. those who have passed through a second or religious birth, which was symbolised by the sacrament of investiture with the sacred cord at the age of puberty; the aborigines they named the *once-born*. The twice-born themselves were divided into three classes in the course of time, a sacerdotal class called Brahmins, a ruling military

class, Kshatriyas, and an agricultural class, Vaisyas. The once-born were called Sūdras. The unequal social rank of these four classes was assigned to an inequality of origin, and this was mythically expressed in a late hymn of the Rig Veda, in which it is said that the Brahman was the mouth of the primitive Man (*purusha*), the Warrior his arms, the Vaisya his thighs, and that the Sūdra sprang from his feet. In the code of Manu the duties and mutual relations of these four castes are systematised and defined.

The *Brahman* is devoted to the service of religion; he alone mediates between God and man, and has the right of performing sacrifice and teaching the sacred Veda; he is himself an actual divinity. His life is portioned out into four periods: (1) As a student he lives with his spiritual preceptor, and acquires a knowledge of the Veda; (2) he becomes a householder by entering the married state, and performs the appointed daily sacrifices; (3) he lives in the woods as a hermit; (4) he cuts himself off from the world, and by profound meditation attains to absorption into Brahma. The last two are no longer obligatory.

The *Kshatriya's* sphere of duty lies in the state. He is to be the mainstay and support of the higher Brahman. The latter draws up and interprets the laws, the former executes them. The *Vaisya's* occupation is the cultivation of the soil and the practice of trade. The *Sūdra* is to be the servant of all three, especially of the Brahman; his hope is that after death he may be born into a higher caste. (Yet the Maharajah of Travancore is a Sūdra; so was Chandragupta.)

Besides these four castes, usually called *varnas*, or colours, various mixed castes are enumerated in Manu as resulting from the intermarriage of the pure castes. The minor castes are mostly subdivisions of the Sūdra. The Chandalas are Hinduised aborigines: the out-caste Pariahs (q.v.) of Southern India are separately dealt with. The Brahmans of Southern India are many of them not of Aryan blood.

The system of caste which at present exists throughout the greater part of India is very different from that described in the code of Manu. With the exception of the Brahmans, the pure castes have disappeared, unless the claim of the Rājputs to be the lineal descendants of the Kshatriyas be admitted, and out of the intermixture of the others have sprung innumerable classes. At the census of 1911, the 'main castes' enumerated in India numbered 180, many of these again falling into numerous subdivisions. Of 50,000,000 representatives of agricultural castes, there are some forty or fifty groups and sub-groups. Of 217,337,943 Hindus or persons professing the Brahmanic faith, 14,598,708 were set down as Brahmans, broken up into a vast number of minor classes—Sherring enumerated 1886 'tribes.' There were 9,430,095 Rājputs, split into 500 'tribes.' The Maatha caste had over 5,000,000 members; the Jat caste, nearly 7,000,000. So engrained in the whole community is this tendency to class distinctions, that Mussulmans, Jews, Parsees, and Christians fall, in some degree, into it; and even excommunicated or out-cast Pariahs form castes among themselves. Most of the existing castes partake of the nature of associations for mutual support or familiar intercourse, and are dependent upon a man's trade, occupation, or profession. Many have had their origin in guilds, in schism from other castes, in the possession of a particular sort of property (as, for instance, landlords are spoken of as the caste of *zamindars*), and similar accidental circumstances. Their names are often due to the district in which the caste took its rise, to their founder, to their

peculiar creed, or any random circumstance. In the Bengal presidency there are many hundreds of such castes, almost every district containing some unknown in those adjacent. In the small state of Travancore, with a population of about two and a half millions, there are said to be 420 castes. There the aboriginal Sūdra Nairs form the ruling or Kshatriya caste, and the half-Arab Mohammedan Moplah takes the place of the Vaisya. Among the lowest classes, it has degenerated into a fastidious tenacity of the rights and privileges of station. For example, the man who sweeps your room will not take an empty cup from your hand; your groom will not mow a little grass; a coolie will carry any load, however offensive, upon his head, but even in a matter of life and death would refuse to carry a man, for that is the business of another caste. When an English servant pleads that such a thing 'is not his place,' his excuse is analogous to that of the Hindu servant when he pleads his caste. When an Englishman of birth or of a profession held to confer gentility refuses to associate with a tradesman or mechanic, it would present itself to the mind of the Hindu as a regulation of caste. Caste does not absolutely tie a man down to follow his father's business, except, perhaps, in the case of the more sacred functions of the Brahmans. For the rest, Brahmans serve as soldiers, and men of all castes have risen to power. Nor is loss of caste anything so terrible as has been represented; in most cases it may be recovered by a frugal repast given to the members of the caste; or the outcast joins another caste. According to many good recent authorities, except Brahmans and Kshatriyas, the four castes are little heard of, and castes are now practically trades, professions, guilds, sub-tribes, &c., which live by themselves and intermarry. Those who do not belong to the four higher castes are now officially and euphemistically called Panchamas, 'of the fifth caste.' To the panchamas belong most servants to Europeans (high-caste servants would not cook for Christians), as also most Christian converts. Perhaps 50,000,000 Indians, a large proportion of them Hindus by religion, are looked on by the castes above them as 'untouchable'; touching them involves ceremonial defilement. Many Hindus have become Mohammedans or Christians mainly to escape the disabilities of caste. Yet even Mohammedans in India recognise to some extent the distinctions of caste. 'Untouchables' become less untouchable when they become Mohammedans or Christians.

It seems certain that many of the rules and restrictions of caste, with the self-respect to which they lead, have conduced to the purity of the family, as well as to cleanliness and health. It is an aid to the weaker members of a caste to know that if they disgrace themselves their fellow-members everywhere will shun them instead of helping them.

Important recent works on caste are Sridhar Kelkar's *History of Caste in India* (1905); Thurston and Rangachari, *Castes and Tribes in Southern India* (7 vols., Madras, 1905-10). The petty regulations of caste, as laid down in the code of Manu, may be seen in the *Translations of the Code of Manu*, by Jones, Burnell, or Bühler; Robertson's *Disquisition on India*; Richard's *India*; Elphinstone's *History of India*; Dubois's *India*; Colebrooke's *Asiatic Transactions*, vol. v.; and in various articles in the *Calcutta Review*. See above all the first volume of Dr John Muir's *Sanskrit Texts* (5 vols.); Steele's *Law and Custom of Hindu Caste* (1868); Kaye and Watson, *The People of India* (6 vols. 1868-72); Sherring's *Hindu Tribes and Castes in Benares* (3 vols. 1872-81); and the Report on 'Caste, Tribe, and Race' in the 1911 *Census of India*, vol. i. (1913).

Castelar, EMILIO, a prominent Spanish orator, statesman, and writer, was born at Cadiz, September 8, 1832. He studied at Madrid, and in

1856 became professor of History and Philosophy in the university there. He began early to write on letters and politics in the newspapers and magazines, and in 1864 started *La Democrazia*, in the pages of which he inveighed fiercely against the government. After the abortive rising of 1866 he was condemned to death, but contrived to escape to Paris, returning when the revolution of 1868 began. All his ardour and eloquence could not hinder the crowning of King Amadeus, though it helped to bring about his downfall in 1873. In the September of that year the Cortes made Castelar dictator, but the orator proved somewhat ineffectual in action, and found himself unable to crush either the 'red demagoguery of Socialism on the one hand, or the white demagoguery of Carlism' on the other. In the beginning of 1874 a hostile vote in the Cortes obliged him to resign, and soon after the *pronunciamento* in favour of Alfonso XII. drove him across the frontier. He returned to Spain in 1876, and was returned to the Cortes, where, till his retirement in 1893, he often spoke with all his old eloquence. He died 25th May 1899. His chief writings are *La Civilización* (2d ed. 1865), *Questiones políticas y sociales* (3 vols. 1870), *Historia del Movimiento republicano en Europa* (2 vols. 1874), *La Question de Oriente* (1876). See Lives by Sanchez de Real (1874), Sandoval (1886), Hannay (1896), and Araco (1900).

Castelbuono, a town of Sicily, 8 miles SE. of Cefalù, with mineral springs, a former Benedictine monastery, and a trade in manna; pop. 12,000.

Castelfranco, a town of Central Italy, 8 miles SE. of Modena; pop. 4000.—Also a town of Italy, 15 miles W. of Treviso by rail, the scene of an Austrian defeat by the French, under Saint-Cyr, 24th November 1805. The principal church possesses a celebrated altar-piece by Giogione, who was born here. Pop. 7000.

Castel Gandolfo, a village 12 miles SE. of Rome, near the west shore of Lake Albano. Here Urban VIII. built a summer residence for the popes. Pop. 3000.

Castellamare, a fortified city and seaport of South Italy, 17½ miles SE. of Naples by rail, built along a sheltered beach on the south-east side of the Gulf of Naples, over which it commands a magnificent view. It is on or near the site of the ancient *Stabia*, which was desolated by Sulla during the Social War, and where the elder Pliny afterwards lost his life when the city was overwhelmed with lava from Vesuvius (79 A.D.). The town was sacked in the 15th century by Pope Pius II., and again in 1654 by the Duc de Guise. The Castello that gave it name was built by Frederick II. in the 13th century. Castellamare has a cathedral, an arsenal, a dockyard; exports potatoes; and manufactures macaroni, cotton, sail-cloth, &c. Pop. 30,000.

Castellamare, in Sicily, at the head of a gulf of the same name, 41 miles WSW. of Palermo by rail, has a population of 17,000, and exports of cotton, wine, fruit, and manna.

Castellan, or CHÂTELAIN, the keeper of a castle in the middle ages. His office and rank varied in various countries. In France and Flanders, the title castellan belonged to the holders of certain demesnes, and was next in order of rank to that of a bailiff.

Castella'na, a town of South Italy, 26 miles SE. of Bari; pop. 11,000.

Castellane'ta, a cathedral city of South Italy, 24 miles NW. of Taranto by rail; pop. 10,000.

Castellio, SEBASTIANUS, a theologian, born in Savoy in 1515, studied at Lyons, and about 1540, on Calvin's recommendation, was appointed rector of a school at Geneva. His views, however, as to

the Song of Solomon (a mere erotic poem to him) and Christ's descent into hell embroiled him with the reformer; and in 1544 he was forced to migrate to Basel, where in 1553 he became Greek professor, and where he died 23d December 1563. Besides various treatises, he published in 1551-53 translations of the Bible into Latin and French, the former dedicated to Edward VI. of England. See CALVIN.

Castello Branco, a town of Portugal, 115 miles NE. of Lisbon, on a height overlooking the Ponsul, with old walls, a ruined castle, and Roman remains; pop. 10,000.

Castellón de la Plana, a town of Spain, in a fruitful plain, 5 miles from the Mediterranean, and 43 NNE. of Valencia by rail. Its churches contain several paintings by Ribalta, who was born here in 1551. There are manufactures of linen, woollen, sail-cloth, brandy, &c. Pop. 31,500. The town is capital of a like-named province (area, 2500 sq. m.; pop. 300,000), and near it is a district rich in oil-shale, now largely worked.

Castelnau, ÉDOUARD DE CURIÈRES DE, French general, born at Rouergue in 1851, served in the Franco-Prussian war, and later became closely associated with Joffre. In the Great War he held various commands on the western front, and was 'major-general of all the armies' under Joffie. He is specially associated with the defence of Verdun.

Castelnaudary, a town in the French department of Aude, situated on a declivity, skirted at the base by the Canal du Midi, 34 miles SE. of Toulouse by rail. It manufactures woollens, silks, and earthenware. Pop. 6000. The *Sostomagus* of the Romans, and *Castrum Novum Arianorum* (hence the modern name) of the Visigoths, Castelnaudary suffered dreadfully in the crusade against the Albigenses, and in 1355 it was captured by the Black Prince. Under its walls, in 1632, the royalists defeated the Duke of Orleans.

Casteltermini, a town of Sicily, 20 miles N. of Girgenti by rail, with extensive mines of rock-salt and sulphur; pop. 15,000.

Castelvetro, a town of Sicily, 46 miles SE. of Trapani by rail, with considerable trade in wine and oil, and manufactures of silk, cotton, and woollen goods; pop. 25,000.

Castelvetro, LODOVICO (1505-71), a humanist, born at Modena, perhaps 'the most illuminating critic of the art of poetry between Longinus and Dryden.' See his *Opere Varie Critiche* (1727) and Charlton's *Castelvetro's Theory of Poetry* (1913).

Casti, GIAMBATTISTA, poet, born at Prato, in Tuscany, probably in 1721, took orders, but in 1764 was introduced to the court of Vienna, where he gained the favour of Joseph II., and was made poet-laureate. On the emperor's death (1790) he returned to Florence, and in 1798 removed to Paris, where he died, 6th February 1803. His best-known works are the 48 *Novelle Galanti* (Paris, 1793) and *Gli Animali Parlanti*, a political satire of charming spirit and grace (free verse translation in W. S. Rose's *Court and Parliament of Beasts*, 1819).

Castiglione, a town of Sicily, on the north slope of Mount Etna, 35 miles SW. of Messina, famed for its hazel-nuts; pop. 12,000.

Castiglione, BALDASSARE, COUNT (1478-1529), became a favourite of the Duke of Urbino, and in 1505 was envoy to Henry VII. of England, who made him a knight. Sent on an embassy to Spain by Clement VII., he died at Toledo, 2d February 1529. His *Il Cortegiano* (trans. 1561), a manual for courtiers, is remarkable for its elegant style. So are his Italian and Latin poems; and his letters are very noteworthy contributions to the political and literary history of his time. Mrs Ady (Julia

Cartwright) published a Life of him, with his letters, in 1908.

Castiglione, CARLO OTTAVIO, COUNT (1784-1849), born at Milan, in his *magnum opus* (1826) sought to ascertain the history of the towns in Barbary whose names are found on Arabic coins; and he edited some fragments of the Meso-Gothic translation of the Bible by Ulfilas (q.v.).

Castiglione, THE COUNTESS (1840-1900), a beautiful and brilliant Florentine lady of doubtful paternity, daughter of the Countess Oldoini, who at fourteen married the Count Castiglione, but afterwards separated from him. She was afterwards sent to Paris by Cavoni as his 'decoy duck,' to secure by whatever means the sympathy and support of Louis Napoleon for the Italian cause. She claimed to have made him take up the cause, and was very conspicuous at his court. After the definitive establishment of the French republic in 1876, she disappeared into obscurity, poverty, and squalor. See Loliée, *Le Roman d'une Favorite* (1912).

Castiglione delle Stiviere, 22 miles NW. of Mantua, is noted for the victory by the French over the Austrians in 1796, which gave the title of duke to Angereau; pop. 6000.

Castile (Span. *Castilla*), the central district of the Spanish peninsula, divided by the Castilian Sierras (8730 feet) into Old and New Castile—*Castilla la Vieja* and *Castilla la Nueva*. The former district—so called because it was first recovered from the Arabs—extends north to the Bay of Biscay, is walled in on all other sides by mountain-ranges, and rises to the height of 2500 to 3000 feet in the form of an elevated plateau, mostly trackless, treeless, exposed to frequent droughts, and generally dreary, parched, and barren, in spite of a few rich tracts. Old Castile is now divided into the eight provinces of Palencia, Valladolid, Avila, Segovia, Soria, Burgos, Logroño, and Santander. The plateau of New Castile, to the south, is also inclosed by mountains, and though lying 1800 feet lower than Old Castile, presents many similar characteristics of soil and scenery, and everywhere the same dreary aspect. It embraces the provinces of Madrid, Toledo, Guadalajara, Ciudad Real, and Cuenca. Old Castile has an area of 25,280 sq. m., and a pop. of 2,500,000; New Castile, 27,935 sq. m., and a pop. of 2,300,000. See the figures for the provinces at SPAIN.

The Castilians are a grave, silent, somewhat stern people, preserving with the haughtiness and pure Spanish of their forefathers also their ignorance and bigotry, but are nevertheless a loyal and manly race. In New Castile a mixture of Mozarabic and Spanish blood has produced a race of men, lean but muscular, and women, slender, graceful, and vivacious; they are the most intelligent people of Central Spain, possess a shrewd mother-wit, and have even more than the general haughtiness of the Spanish character. The language of Castile prevails throughout the educated classes, as in the literature of Spain, and its rulers have extended their sway over the whole nation.

Castile, so named from the great number of its frontier castles, was from the 8th century under the suzerainty of the kings of Asturias and Leon, but was governed by its own counts, who in the 10th century became practically independent. In 1026 Sancho the Great of Navarre annexed the greater part of Castile, which he left to his second son, Ferdinand I. (1035-67), who annexed Leon, Asturias, Galicia, and the district on the right of the Ebro. This union was not permanent, his territories being divided at his death among his three sons; but in 1072 the kingdom was reunited under Alfonso VI. The two kingdoms, however, were finally reunited in the person of

Ferdinand III. (1230-52), who captured Cordova and Seville, and extended the frontier of Castile to the southern coast. Among the successors of Ferdinand III., the most distinguished were Alfonso X. and Pedro the Cruel (q.v.). For two centuries the history of Castile is largely a record of minorities and civil wars, until, by the marriage of Isabella, sister and successor of Henry IV., with Ferdinand, king of Aragon (1469), the two crowns of Castile and Aragon became united (1479), and the kingdom of Spain was founded. See SPAIN.

Castillejo, CRISTÓVAL DE, the last of the old Spanish court poets, born at Ciudad Rodrigo about 1490, became secretary to the Infante, afterwards Ferdinand I., whom he followed to Germany. He died in Vienna, 12th June 1556.

Castillo. See DIAZ DEL CASTILLO.

Castillon, a town of 3000 inhabitants in the French department of Gironde, on the right bank of the Dordogne, 33 miles E. of Bordeaux by rail. Beneath its walls, on 17th July 1453, the English met with a signal defeat, their leader, Earl Talbot of Shrewsbury, and his son, being slain. Part of the battle is described in the fourth act of Shakespeare's *King Henry VI.*, Part I.

CASTING. See FOUNDING.

CASTING-VOTE, the vote by which the chairman or president of a meeting is generally empowered to cast the balance on the one side or the other, where the other votes are equally divided. In the House of Commons the Speaker does not vote at all unless this state of things occurs. As his position in this respect is felt to be a delicate one for a person whose duty it is to withdraw himself from the contentions of party, it is usual for the Speaker to vote in such a way as to give the House an opportunity of reconsidering its decision by further discussion; but if the merits of a bill cannot be avoided, the Speaker is entitled to vote according to his conscience. The same rule prevails in select committees, and for the chairman of Committee of the whole House or of Ways and Means. Following a similar rule, the chairman at corporation and ordinary public meetings usually gives his casting-vote in a way that will lead to a reconsideration of the subject.

Cast-iron. See IRON AND STEEL.

Castle. Castles or fortified places for defence are common to all nations, and seem, like houses, to have generally passed through various stages of development. The earliest fortress consisted of a naturally strong site, defended either by water, as in the case of a small island, or by difficulty of access, as in the case of a precipitous and isolated rock. For these primitive strengths artificial means of defence were afterwards substituted, either by the construction of dwellings raised on piles driven into the beds of lakes, or by the formation of artificial mounds with the materials dug out of a ditch around them, thus providing by one operation an elevated site, and surrounding it with a defence which increased its inaccessible character.

A mixed style was also frequently adopted, in which a naturally strong position was rendered more secure by the construction of ditches and mounds around it. Kelts, Saxons, and Danes do not seem to have built castles in our sense, their defensive works being for the commune, not the chief. From Northern France the early Normans introduced into England, Scotland, and Ireland the 'motte' or mote, till of late referred to their predecessors, the artificial mound surrounded by a ditch, fortified with a palisade, and crowned by a wooden castle. 'Motte' (O. Fr. *motte*, *mote*, a clod, hillock) has been confused with 'moot' (Old Eng. *mót*, meeting). In Southern France, where

Roman civilisation lasted longer than in the north, the *castra stativa* formed the model for the defences of the castle, while the arrangements of the Roman 'villa' were continued in the country houses. Not till the 12th or 13th century did the 'Edwardian castle' or 'Norman keep' supersede in England the wooden tower or keep with its bailey. The Norman keep consisted of a square or oblong tower, the walls of which were built with stone and mortar, and were always of great thickness. It relied for its defence on the passive resistance of its solid walls to all the appliances which the engineering of the time could bring to bear upon them. The basement was vaulted and had only very narrow openings in the walls for air. The entrance-door was usually on the first floor, and was approached either by a movable ladder, or by a stone staircase erected in a well-defended tower or 'forework' built at one side of the keep. On the first floor was the hall, or common room, where all the inhabitants of the castle took their meals and slept, except its lord, who with his family occupied the apartment on the second floor. The top was crowned with a battlement from which the active defence was carried on. These castles had courtyards attached to them which were called the outer and inner 'bailey,' and the keep was frequently placed at the wall dividing the courtyards.

In the 13th century the art of attack and defence had greatly improved, and it was found necessary to a large extent to modify the simple Norman system. The passive solidity of the keep no longer sufficed to save it from the operations of the sappers, and the principle was gradually evolved in military architecture that 'that which defends must be itself defended.' Hence arose the system of strengthening the walls of enceinte of the courtyards, and of constructing all around them a series of towers, attached to but projecting boldly from the walls at short intervals, so as to permit the defenders to watch and guard the intervening 'curtains' or straight portions of the walls of enceinte, with flank fire from the battlements of the towers. The whole structure thus became a great 'castle,' each portion serving as a defence to the rest. Each tower was also so arranged as to form a small independent fort, capable of maintaining a separate defence, and the keep was still preserved as the residence of the commander, and as a last refuge in case of need. Every portion of the castle had thus to be assaulted separately—the fall of one wall or one tower did not imply the surrender of the stronghold, and even after all the walls and towers connected with them had fallen, the commander with his household retainers might yet maintain a stubborn resistance in the keep while their provisions lasted. Of the fortresses of this period the great castle of Couci in the north of France is the typical example; and Carnarvon, Caerphilly, and other specimens of what is called the Edwardian style, are well-known English illustrations. These castles, though strong in war, were dull and lonely places of abode in peace, and as civilisation advanced and manners softened, the lords and their families forsook the gloomy keeps and preferred to dwell in halls and private rooms erected in the inner courtyard and ranged along the outer walls, so that from windows therein they might enjoy a view over the surrounding country and what went on abroad. These apartments gradually increased in number, until in the 15th century the castles of the nobles became not only impregnable fortresses, but splendid palaces. The castle of Pierrefonds, near Compiègne, built in 1390, and restored in 1865 by M. Viollet-le-Duc, gives a noble idea of the magnificence and grandeur of these palatial residences. In England the castles of Warwick, Kenilworth, Bodiam (Sussex, near

Rye), &c., show the same combination of powerful military and elegant domestic architecture.

But a new agent in the art of war was at hand, before which these proud strongholds had after a

Castle of Couci (from Viollet-le-Duc).

short and bitter struggle to succumb. Believing them impregnable before the introduction of gunpowder in sieges, the nobles could not for a long time bring themselves to admit that their feudal fortresses were no longer able to shelter them from the assaults of artillery; but by-and-by this truth was forced upon them, and then recognising the uselessness of their gloomy walls, they vied with one another in throwing them down, so as to open up their abodes and render them, after the manner of the Italian villas, pleasant and cheerful country residences, with scarcely a feature suggestive of defence. It was now freely admitted that fortresses must henceforth consist of separate and much greater structures than were compatible with the resources of even the most powerful nobles, and that they might better be left in the hands of the government.

Although the country residences of the nobles erected after this time (16th century) still partook of the old character in their external aspect, and exhibited the same appearance of towers and battlements, loopholes and drawbridge, these features were no longer employed for use, but only from habit and a desire to maintain the traditional dignity and importance of the castle. The château of Sully-sur-Loire is a good specimen of the manner in which the later castellated style was carried out in France. The name, too, of 'castle' or 'château' often survives and dignifies a defenceless country mansion. Finally the spread of the Renaissance swept away the few remaining symbols of castellated architecture, and introduced in its place the symmetrical and open style of the 17th century. Many of the transition examples are, however, of great interest and beauty, and compose the great bulk of the picturesque and well-known châteaux of France. Our Scottish castles of the time of James VI. also owe much of their

picturesque effect to the mixture of castellated or defensive features with the enlargement and improvement of domestic accommodation.

See HILL-FORTS, LAKE-DWELLINGS; Viollet-le-Duc, article 'Architecture Militaire' in the *Dictionnaire* (1854-69); Parker, *Domestic Architecture of the Middle Ages* (1853-60); G. T. Clark, *Medieval Military Architecture* (1884); MacGibbon and Ross, *Castellated and Domestic Architecture of Scotland* (5 vols. 1886-92); Mackenzie, *The Castles of England* (2 vols. 1896-97); G. Neilson, *The Motes in Norman Scotland* (1898); Orpen, *The Normans in Ireland* (1901); Mrs Armitage, *The Early Norman Castles of the British Isles* (1912); A. H. Thompson, *Military Architecture in England* (1912); H. G. Evans, *Castles of England and Wales* (1912).

Castlebar, the capital of County Mayo, Ireland, 152 miles NW. of Dublin by rail. Here the Irish in 1641 massacred the English garrison. In 1798 the French general, Humbert, held the town for a fortnight. Pop. 3700.

Castlecary, a market-town, with railway station, Somersetshire, 12½ miles NNE. of Yeovil. —Also a railway station, and old castle, 6½ miles SW. of Falkirk, Stirlingshire, near one of the stations of Antonine's Wall, excavated in 1902.

Castle Douglas, a town in Kirkcudbrightshire, on Carlingwark Loch, 9 miles NE. of Kirkcudbright, with sheep and cattle marts; pop. 2800.

Castleford, a town in the West Riding of Yorkshire, on the Aire, 10 miles SE. of Leeds, manufactures bottles and jars; pop. 24,000.

Castle Garden, originally Castle Clinton, a round fort (1807) built 300 yards out from the south end of Manhattan Island, was in 1824 converted into a place of amusement; in 1839 planted with trees, turf, and flowers; in 1847 again transformed into an opera-house; and in 1855 made the immigration depot of New York. In 1890 this depot was transferred to Ellis Island in New York Harbour. A public aquarium was established on the site of Castle Garden.

Castlemaine, a town of Victoria, 77 miles NNW. of Melbourne by rail. The gold-diggings here were among the first discovered in Australia. Pop. 7000.

Castlereagh, ROBERT STEWART, VISCOUNT, was born 18th June 1769, the son of an Ulster proprietor, who in 1789 was created Baron Londonderry, in 1795 Viscount Castlereagh, in 1796 Earl, and in 1816 Marquis, of Londonderry. Robert was educated at Armagh, and, after a twelve-month at St John's College, Cambridge, was making the grand tour of Europe when in 1790 he was summoned home to enter the Irish parliament as Whig member for County Down—the election cost his father £60,000. He turned Tory in 1795, and next year became Keeper of the Privy Seal; but he continued a steadfast supporter of Catholic emancipation. Still, he believed that emancipation with an independent Irish parliament would mean simply a transference of tyranny from the Protestant oligarchy to a Catholic democracy; hence, as Chief-secretary from 1797, he bent his whole energies to forwarding Pitt's measure of Union. That measure was carried in 1800, largely through Castlereagh's skill in buying up the borough-mongers; but Pitt's pledges to the Catholics were defeated by George III.'s bigotry, and Castlereagh with Pitt retired from office.

Transferred by the Union from Dublin to Westminster, he accepted office in the weak Addington ministry (1802) as President of the Board of Control; but the true second era in his career was as War Minister under Pitt from July 1805 to January 1806, and again under Portland from April 1807 to September 1809. The bombardment of Copenhagen

and seizure of the Danish fleet, the extension of the war to the Peninsula, and selection of Wellesley for general, may be set off against the disastrous Walcheren expedition; and even that was a brilliant conception, marred only by the king's obstinacy in giving Lord Chatham the command. Anyhow, Castlereagh was made the scapegoat, and the shilly-shally behaviour of his colleagues caused him to challenge his great rival, Canning. On 21st September 1809 they met upon Putney Heath, and, at the second fire, Canning received a slight wound in the thigh, whilst Castlereagh escaped with the loss of a button.

His real greatness begins with March 1812, when, as Foreign Secretary under Lord Liverpool, he became the soul of the coalition against Napoleon, which, during the momentous campaigns of 1813-14, was kept together by him, and by him alone. 'Time,' Green acknowledges, 'has long ago rendered justice to Castlereagh's political ability, disguised as it was to men of his own day by a curious infelicity of expression; and the instinctive good sense of Englishmen never showed itself more remarkably than in their preference at this crisis of his cool judgment, his high courage, his discernment, and his will, to the more showy brilliancy of Canning.' He represented England at the congresses of Châtillon and Vienna (q.v.) in 1814-15, at the treaty of Paris in 1815, at the congress of Aix-la-Chapelle in 1818; and he was preparing to start for a congress at Verona, when, on 12th August 1822, in a fit of insanity, he committed suicide with a penknife at Fooks Cray, his Kentish seat.

England and Europe owe much to Castlereagh for the forty years' peace that succeeded Napoleon's downfall. Yet no statesman, save Strafford, was ever pursued with more rancorous hatred—a hatred that raised a shout of exultation as he was borne to his grave in Westminster Abbey. Green notwithstanding, to many even at the present day he is still the cold-blooded repressor of the Irish rebellion, the 'executioner in enamel,' the sympathiser with the Holy Alliance, the tool of Metternich, Queen Caroline's persecutor, and the author of the Peterloo massacre and the coercive 'Six Acts' which, if the words of our former edition were true, 'will for ever stamp his name with infamy.' His failings have been exaggerated, his splendid services in diplomacy lost sight of or tardily recognised; but, in truth, as a minister, Lord Castlereagh was not lovable.

He had succeeded his father as second marquis in 1821, and leaving no issue by his accomplished wife, a daughter of the Earl of Buckinghamshire, whom he married in 1794, was himself succeeded by his half-brother, Sir Charles Stewart (1778-1854), soldier, diplomatist, military historian, and founder of Seaham Harbour.

See Castlereagh's *Correspondence and Despatches* (12 vols. 1847-53); *Life* by Sir A. Alison (1861); one of Lord Salisbury's *Essays* (repub. 1905); the short *Lives* by the Marchioness of Londonderry (1904) and G. Hassall (1909); C. K. Webster, *The Foreign Policy of Castlereagh* (1926).

Castleton, (1) capital of the Peak (q.v.) district, Derbyshire, 10 miles NE. of Buxton, is commanded, to the south, by the ruined castle of William Peveril, natural son of the Conqueror. —(2) A Liddesdale parish, in Roxburghshire — For another Castleton, see BRAEMAR.

Castletown (*Manx* *Ballei Cashtal*), a seaport and former capital of the Isle of Man, on Castletown Bay, 11 miles SW. of Douglas by rail. Castle Rushen, now a prison, occupies the site of a Danish fortress of the 10th century, which was almost wholly demolished by Robert Bruce in 1313. The grounds of Rushen Abbey (11th century), near the station, are now market-gardens.

Hard by is the small building where the House of Keys assembled for about 170 years. Brewing, tanning, and lime-burning are carried on. Near Castletown is King William's College (1833), an Elizabethan pile, rebuilt after the fire of 1844, and enlarged in 1862. Pop. 2000.

Castor and Pollux, often called *Dioscuri* or 'sons of Zeus,' were according to Homer the sons of Leda and Tyndareus, and so brothers of Helen of Troy. Another tradition made both of them sons of Zeus and Leda; a third made only Pollux Zeus's son, and so alone immortal. Castor was famous for his skill in managing horses, Pollux for his powers in boxing. Both received divine honour at Sparta as patrons of travellers by sea; the Romans they assisted at the battle of Lake Regillus. One story tells that when Castor, the mortal, was killed, Pollux prayed Zeus to let him die with him, and was permitted either to live as his immortal son in Olympus, or to share his brother's fate and live one day in heaven with the gods, the other among the shades. Zeus placed the brothers amongst the stars as *Gemini*, and their names are attached to the principal stars in that constellation. Their names are also given to the electric phenomenon known as St Elmo's Fire.

Castoreum, a soft brown substance, of peculiar smell and taste, secreted by two pear-shaped glands, associated with, but quite distinct from, the reproductive organs in both sexes of beaver. It is now used chiefly by perfumers, but was from the time of Hippocrates regarded as having a specific influence on the uterus, and esteemed as a soothing medicine in hysteria, catalepsy, cramp, and other spasmodic diseases. In commerce it appears in the two glandular sacs as removed from the animal. In Hudson Bay trade, ten pairs of glands used to be equal in value to one skin, and Russian castoreum was yet more valuable. See BEAVER.

Castoridae, a family of rodent mammals, in the squirrel-like section, represented by the genus *Castor* with a single species, the familiar Beaver (*Castor fiber*). The swimming habit, the massive skull, the rounded angle of the lower jaw, and the peculiar molar teeth are among the more distinctive characters. See BEAVER.

Castor-oil, a fixed oil obtained from the seeds of the castor-oil plant. In extracting the oil, the seeds are first bruised between heavy rollers, and then pressed in hempen bags under a hydraulic or screw press. The best variety of oil is thus obtained by pressure in the cold, and is known as *cold-drawn* castor-oil; but if the bruised and pressed seeds be afterwards steamed or heated, and again pressed, a second quality of oil is obtained, which is apt to become partially solid or frozen in cold weather. In either case, the crude oil is heated with water to 212° (100° C.), which coagulates, and separates the albumen and other impurities. Exposure to the sun's light bleaches the oil, and this process is still resorted to, but since the introduction of the nearly tasteless Italian castor-oil, which in itself is almost colourless, there is not the same demand for the bleached article. When pure and cold drawn, castor-oil is of a light-yellow colour; but when of inferior quality, it has a greenish, and occasionally a brownish tinge. It is somewhat thick and viscid. Its specific gravity is high for an oil, being about .960. It is miscible with alcohol or spirits of wine and ether. Reduced to a temperature of 0° (-18° C.), it does not become solid; but exposed to the air, it very slowly becomes rancid, then dry and hard, and serves as a connecting link between the drying and non-drying oils. The commoner qualities have a nauseous smell, and an acrid, disagreeable, and sickening taste, but the fine medicinal article is frequently almost free from

those objectionable properties. Repeated attempts have been made to obtain from it an active principle, to which it might owe its purgative properties, but without success. It, however, contains a peculiar oily acid, called Ricinoleic Acid, $C_{18}H_{34}O_2$.

Castor-oil is one of the most convenient and mildest of purgative medicines. Given in doses of one or two tea-spoonfuls, it forms a gentle laxative for those who are easily acted on by medicine; while a dose of a table-spoonful, or a little more, will almost always succeed if it remains on the stomach. The only serious objections to the use of castor-oil are its flavour and the sickness often produced by it. It may be administered floating on peppermint or cinnamon water, or on coffee, or shaken up with glycerine. But the most effectual plan for disguising the disagreeable flavour is to inclose it in thin gelatin capsules, holding as much as a tea-spoonful or more.

The adulterations of castor-oil may be various. Several of the fixed oils, including lard, may be employed. The best test of its purity is its complete solubility in its own volume of absolute alcohol. It is used also as a lubricant, for soap-making, and in India for burning in lamps. Croton-oil is occasionally added.

CASTOR-OIL PLANT (*Ricinus communis*; natural order Euphorbiaceae) is a native of India, but now

Castor-oil Plant (*Ricinus communis*).

naturalised in most tropical, subtropical, and even warm temperate countries. It is known in the Mediterranean countries as *Palma Christi*. It is also found in cultivation even in northern Europe, where, however, it is only annual. Under these circumstances it attains a height of 4 to 6 or more feet, while in warmer climates it becomes a small tree. The flowers are comparatively inconspicuous, in monoecious racemes, but the foliage is peculiarly handsome. There are a large number of varieties, many described as distinct species.

Castrametation is the art of forming a Camp (q.v.).

Castration is the method by which animals, both male and female, are deprived of parts of their generative organs (testicles and ovaries). They are in consequence rendered more valuable for working purposes, and also tend to grow and fatten much more quickly for the butcher. A castrated horse is called a gelding; a castrated bull, a bullock or steer (Scots, 'stot'); a castrated boar, a hog; and a castrated ram, a wether. These are the ordinary male animals operated on in this country, but occasionally cocks are castrated, and are then called capons. Castration of females is called 'spaying,' and is frequently performed upon sows, which are then called gelts. In the male animal, after he has been properly secured, an incision is made into the testicular sac, and each testicle removed, either by torsion, by actual canterly, by caustic clam, or by scraping the cord. In the female animal an incision

is made in the right flank, and each ovary removed through the opening, which is then stitched up. The operation is followed by several dangers, such as blood-poisoning, lock-jaw, hernia, hemorrhage, scirrhus cord, &c. See EUNUCH, where also the subject of *castrati* singers is dealt with.

Castren, MATHIAS ALEXANDER, the founder of Ural-Altaian philology, was born in 1813 at Tervola in the north of Finland. He received his earliest instruction in the town of Tornea, and afterwards studied at Helsingfors (1830-36). In 1838 he undertook a pedestrian excursion through Finnish Lapland, in order to extend his knowledge of the language and literature; and, in 1839, another through Karelia, to collect ballads, legends, &c., illustrative of Finnish mythology. On his return, he published in Swedish a translation of the great Finnish epic, the *Kalevala* (q.v.). During 1841-45, conjointly with Lönnrot, he prosecuted his researches among the Finnish, Russian, and Norwegian Laplanders, as also among the European and Siberian Samoyeds; whilst, as linguist and ethnographer to the St Petersburg Academy, he, between the years 1845 and 1849, extended his laborious investigations as far east as China, and as far north as the Arctic Ocean. On his return he was appointed professor of the Finnish language and literature at the university of Helsingfors. He employed himself in preparing for publication the vast materials which he had collected, but died 7th May 1852, from exhaustion—a martyr to science. The six works published before, and the twelve after his death, are mostly in Swedish, but the greater number have been translated into German. They include accounts of his travels, lectures on Finnish mythology and the Altaian races, grammars, vocabularies, &c. See his *Life* by J. W. Snellman (1870). A son, Robert Castren (1851-83), wrote several monographs on Finnish history.

Castres, a town in the French department of Tarn, is situated on both sides of the river Agout, 46 miles (72 by rail) E. of Toulouse. It rose up around a Benedictine abbey, which was founded in 647; and in the 16th century it became a Huguenot stronghold, but its fortifications were demolished in 1629. The present town has beautiful promenades, shaded by fine alleys of trees, a quondam cathedral, and important manufactures of fine wool dyed goods, as also manufactures of leather, paper, soap, &c. Pop. 25,000.

Castri. See DELPHI.

Castro, the modern name of the capital of several islands of the Grecian Archipelago—Lesbos, Samothrace, Melos, Lemnos, &c.

Castro, GUILLEN DE, a Spanish dramatist, in the judgment of Voltaire the writer of the first true tragedy that had appeared in modern Europe, was born in Valencia in 1569, and was at one time commander of a Neapolitan fortress. In his later years he lived in Madrid, and was on intimate terms with Lope de Vega; but his sour temper lost him many friends, and he is said to have died in abject poverty in 1631. Castro's memory has been chiefly preserved by his authorship of *Las Mocedades del Cid*, to the first part of which Corneille was indebted for the plot and many of the beauties of his celebrated tragedy. The second part of the *Mocedades* has few passages that rise above mediocrity; and his other plays are badly constructed, and chiefly distinguished for their intensely national spirit. See Ticknor (1849), B. Clarke (1893), and Fitzmaurice Kelly (1898) on Spanish literature.

Castro, INEZ DE, the daughter of a Spanish nobleman, in 1340 came to Portugal in the train of her cousin, Costança, the bride of the young Infante, Dom Pedro. Her beauty captivated him,

and, after Costança's death in 1345, he made her his mistress, in 1354 his wife. The secret of the marriage was revealed to his father, Alfonso IV.; and with his consent the hapless Inez was stabbed to death in January 1355. In 1360, three years after Alfonso's death, Pedro executed two of the three murderers with horrible tortures, whilst the corpse of Inez herself, clad in royal attire, was seated on a throne, and received homage as queen. So, at least, runs the tradition, immortalised by Camoens; but all that is certain is that her body was reinterred with great splendour at Alcobaça.

Castro, JOÃO DE, a famous Portuguese soldier and traveller, born at Lisbon in 1500. In his boyhood he showed a remarkable aptitude for study, but at eighteen he chose for himself a life of adventure by volunteering against the Moors at Tangiers. He next accompanied Charles V. to Tunis, and had already fought and travelled in the East, when in 1545 he sailed to the Indies at the head of a small expedition. Here he covered himself with glory by the overthrow of the Mohammedans, and by the heroic relief and defence of Diu. For these exploits he was appointed Portuguese viceroy, but did not live to enjoy the dignity, dying in the arms of Francis Xavier in June 6, 1548. His *Life*, by Andrada (1651), was translated into English in 1664.

Castro del Rio, a town of Andalusia, Spain, situated on the Guadajoz, 23 miles SE. of Cordova. It has manufactures of woollen and linen fabrics, earthenware, &c., and considerable trade in agricultural produce. Pop. 15,000.

Castrogiovanni, a town in the middle of Sicily, 56 miles E. of Catania by rail, on a remarkable fertile plateau, which rises precipitously to a height of 3270 feet above sea-level. Castrogiovanni occupies the site of the ancient *Enna*, of which Ceres was the presiding goddess, and here was her most famous temple. The neighbourhood was the fabled scene of the rape of Proserpine. In connection with the Punic and Servile wars, Enna played a conspicuous part in early history. A castle and other buildings of Saracenic origin are still standing. Pop. 26,000.

Castro Urdiales, a town on the north coast of Spain, on a rocky headland, 30 miles ESE. of Santander, with a safe roadstead; pop. 15,000.

Castrovillari, a town of south Italy, 34 miles N. of Cosenza, on an eminence surrounded by mountains. It has a trade in wine, manna, silk, &c. Pop. 10,000.

Castruccio-Castracani (1281-1328), born at Castruccio near Lucca, was exiled in his youth with his Ghibelline relatives. After a distinguished career as a soldier of fortune in England, France, and Lombardy, he was recalled, defeated the Guelphs at Montecatini (1315), assisted and was imprisoned by Uguccione of Pisa, and routed the Florentines at Altopascio (1325). At first a partisan of Frederick of Austria, he afterwards joined Ludwig the Bavarian, who made him Duke of Lucca, Pistoja, Volterra, and Luni (1327).

Cast-steel. See IRON AND STEEL.

Casualties of Superiority, in the feudal law of Scotland, such emoluments arising to the superior as depended on uncertain events. The casualties of ward, marriage, and recognition were abolished along with the military tenure of wardholding, of which they were incidents, shortly after the Jacobite rebellions. The casualty of 'non-entry' was, strictly speaking, abolished by the Conveyancing Act of 1874; and after that statute the only casualties remaining in force were liferent-escatch (see ESCATCH), relief, and composition. The Act of 1874 enacts that in feus granted after

1st October 1874 no casualties are exigible in law, apart from express covenant, and that payments of the nature of casualties cannot thereafter be stipulated for unless they are fixed in amount and made payable at definite intervals. Casualties incident to a feu created before that date, which were not of fixed amount and payable at fixed intervals, were rendered redeemable at the instance of the feuar. By the Feudal Casualties Act, 1914, all casualties, including duplicands of feu-duties or ground-annuals, are made compulsorily redeemable at the instance of either superior or feuar. If not redeemed within fifteen years they are extinguished.

Casuarina (Cassowary tree), a peculiar genus forming the order Casuarineæ, of problematical position. Treub discovered in 1891 that the Ovule (q.v.) is fertilised by the chalazogamic method; and it has been proposed, therefore, to separate Casuarina from all other Angiosperms as 'Chala-

Branch of *Casuarina equisetifolia* :

With male and female flowers, the former in catkins at the end of the shoots, the latter (a) crowded in cone-like heads. At b, note single female flower, and at c, a group of male flowers. A section of the fluted stem, with reduced leaves, is represented at d.

zogamæ,' with affinities to Gymnosperms. See CHALAZA. Of the 30 species, the great majority are restricted to Australia and the adjacent islands. Some of them are large trees, producing timber of excellent quality, hard and heavy, the *Beef-wood* of the Australian colonists. Other species are scrubby bushes, and all have a very peculiar appearance, their branches being long, slender, wiry, drooping, green, jointed, with very small scale-like sheaths instead of leaves. They thus curiously resemble arborescent Equisetaceæ.

Casuistry, in the widest sense, is the reasoning which enables a man to decide in a particular case between conflicting, or apparently conflicting, duties. Against casuistry so understood no reasonable objection can be raised. Instances of it may be found in the gospels, in the epistles of St Paul, and in the early fathers. Indeed, St Augustine, in his little works *De Mendacio* and *Contra Mendacium*, may be said to have written casuistical treatises. Gradually, however, casuistry developed within the Catholic Church to an extent which is nothing less than a change in kind, and

must radically affect the judgment formed of its merits or demerits. First of all, the ecclesiastical canons became more and more elaborate in their enumeration and classification of grave offences, for which certain definite punishments were due, and, more and more, what had been at first a public discipline was transferred to the court of conscience. Only, it was not the individual conscience which passed sentence in place of the bishop's court. The sins were submitted to the judgment of the priest in secret confession, and for this purpose he was bound to provide himself with a 'penitential book'—i.e. with a summary of the penalties attached to particular sins by the law of the church. These books were in use from the 7th to the 13th century. Another great change occurred in 1215, when the fourth Lateran Council made the confession of every mortal sin to the priest a matter of obligation on all Christians. Then, and not till then, casuistry, in the modern sense, began to be. It is generally known among Roman Catholics as 'moral theology,' and may be defined as the science of the confessional. It professes to decide on the nature of all possible actions, to determine when any particular action is sinful or innocent, to distinguish between binding duty and that which is praiseworthy but not obligatory. It weighs motives and intentions, decides the relative gravity of sins, and the aggravating or extenuating circumstances attending them. Instead of stepping in like the casuistry of the early Christians in doubtful cases, it undertakes to regulate all moral action, covering the whole extent of life and entering into each detail. Instead of giving a list of legal punishments imposed by the church, it anticipates the judgment of God in the world to come. This of course requires an examination of actions in detail, which is often ludicrous or repulsive, always unreasonable. Does a man who steals four shillings commit a mortal sin or only a venial one? In other words, is he liable thereby to the punishment of hell or only of purgatory? Does a man who blasphemes twenty saints at once commit twenty sins, or only one? Are we bound under mortal sin to pray once a month, or only once a year? Such are the questions discussed in every manual of casuistry. They are settled by Scripture, reason, the canons of the church, and the opinion of eminent theologians. A further development dates from the introduction of the system known as Probabilism, first propounded by a Spanish Dominican, Medina (1528-81). It rests upon the theory that the moral law does not bind in cases when it is doubtful, and that it may be considered doubtful if the theologians of name have denied that it binds in the particular cases. We have only to consider the endless discussions which these theologians have raised on points of practice, to form some idea of the laxity to which this system leads. Adopted by most of the Jesuits, it was hated 'as a pest of morality' in France, where it was exposed in the Provincial Letters of Pascal, and condemned by the General Assembly of the clergy in 1700. But since the French Revolution it has obtained an exclusive supremacy in the Roman Catholic Church, and at this day no other system is ever thought of.

The name of casuists is legion. The *Summa de Casibus Penitentialibus*, by St Raymond of Penafort, is among the earliest works on the subject. He flourished about 1228, and his book was followed by a multitude of others with similar titles. The highest authority was attained by St Alfonso Liguori, who wrote in the middle of the 18th century; and the 'Sacred Penitentiary' at Rome has declared that every confessor may safely follow all his opinions. Modern manuals, chiefly based on Liguori, have been written by Scavini

Gury (annotated by Ballerini), Lehmkuhl, and others. The objections which Luther made, and which Protestants still feel, to the casuistry described above, are directed against its radical principle and not merely its details. The New Testament, they think, teaches that a man is justified by surrendering himself entirely to God through Christ, and it knows nothing of an elaborate system of law, of which a minimum must be observed as the condition of salvation. They believe that a man's own conscience, enlightened by Christian teaching and example, will generally leave him in little doubt as to his duty, and they object to the constant discussion of moral questions, to the desire to ascertain how little we are bound to do, as ruinous to the moral sense. They deny that the subtleties of a pretended science can ever gauge the amount of sin involved in a particular action. God alone can distinguish between the sudden fall which happens in spite of a man's real character and the sin which reveals his inner corruption. Above all, they object that the so-called science must needs rest in the hands of the priests, and that practically a layman must cease in great measure to have a conscience of his own. A few Protestants—e.g. Jeremy Taylor, and the Puritans Perkins and Amesius—have produced casuistical books, but they deal with cases of special difficulty, and are not in the same sphere as the Roman casuistry. Besides, such Protestant works have long since fallen into desuetude, and it has been agreed that any elements of utility in casuistical discussion may be safely relegated to ethics and pastoral theology. See MacCunn's *Making of Character* (1890); and see Sidgwick's *Methods of Ethics* for what is substantially a criticism of casuistry.

Casus Belli, an occasion of war, is the reason alleged by one power for going to war with another, such as defence of independence, redress of grievances, satisfaction for dishonour to the flag, or enforcement of treaty obligations. See ARBITRATION, ENEMY, INTERNATIONAL LAW, PEACE.

Cat, a name applied to various species of the genus *Felis*, in the family Felidae, and in the æluroid section of carnivora. This æluroid section includes the most specialised carnivores; and the members of the genus *Felis*, including lion and tiger, panther and cat, exhibit carnivorous characteristics in their highest perfection.

General Characters of Cats.—The canine teeth of Felidae are large and strong, the true molar teeth reduced to one on each jaw, the molar of the lower jaw and the last premolar of the upper jaw function as special cutting (sectorial) teeth, the face portion of the skull is short and broad, the auditory bone bulbs (bullæ) are large, rounded, smooth, and divided by an internal septum. The feline carnivores walk on the tips of their toes, in digitigrade fashion; the claws are large, strong, sharp, and completely retractile. The iris is very movable, and the aperture contracts to a vertical slit. The tongue is covered with sharp rough papillæ. The cæcum on the intestine is small and simple. There are many other more technical structural characters. The Felidae are conspicuously carnivorous in their diet. Domestic cats eat fish when they can get it; and the Indian Fishing-cat (*F. viverrina*) feeds on fish and even molluscs. They hunt alone and stealthily, surprising their victim by a sudden spring, loving darkness, hating water, and in most cases are more or less arboreal.

Species.—The genus *Felis* includes some fifty species, the distinctions of which are somewhat difficult. Among the Old-World species, the most familiar are the lion, tiger, leopard or panther, ounce, wild cat (*F. catus*), and domestic cat.

Among the New-World species, the puma, cougar or American panther (*F. concolor*), the jaguar, the pardal (*F. pardalis*), the pampas cat, are common forms. The term lynx is applied to several different species, and the name cat is used with equal width. The Cheetah (q.v.) is often regarded as a distinct genus.

Wild Cat.—The Wild Cat (*F. catus*) found in the woods of Europe was common in England in the middle ages, when abbesses were forbidden to wear furs more costly than those of lambs or cats; in Wales it lingered on almost till the present day. The wild cat said to have been killed in Lincolnshire in 1883 was probably, like most recent 'wild cats' reported in England, only a domestic cat that had taken to the woods. The true wild cat was found in Yorkshire as late as 1840; in the Lake District an undoubted specimen was killed in 1843. In most parts of Scotland the wild cat is now extinct, but, according to Mr Harvie Brown, is still found northward and westward of a line from Oban by Dalmally along the Perthshire border to Tomintoul, and thence to Inverness. In Perthshire it died out rapidly after 1850, though specimens were found in 1850, 1870, and 1871; in Wigtown, Dumfries, and Kirkcudbright it has not been seen since 1832. According to Mr J. G. Millais, who has gone carefully into the subject in his magnificently illustrated *Mammals of Great Britain and Ireland* (1904), the main stronghold of the wild cat of to-day is northern and western Inverness and western Ross-shire. It is found, or was lately, in Spain, France, Switzerland, Germany, Poland, Dalmatia, Greece, Transylvania, and across south-eastern Europe, into northern Asia. It is stronger and larger than the house cat, with stouter head, shorter and thicker tail, more abundant whiskers, and in the male with deep black soles. Mr Millais shot an exceptionally fine specimen, 3 feet 10 inches from nose to tip of tail, at Kinloch-Moidart, in Inverness-shire, in October 1899. The predominant colour is yellowish gray, a dark stripe runs along the back, darkish stripes down the sides, cross bands on the legs, and rings on the tail. It is very savage in disposition. The female has its litter in a hollow tree or rock cleft. Though a large number of the 50 species of *Felis* have received special popular titles, like lion, tiger, ounce, &c., there remain a large number to which the title 'wild cat' is quite as applicable as it is to the more familiar *F. catus* of Europe.

Domestic Cat—History.—Our common cat, familiar in many varieties of colour, is not a tamed descendant of this Wild Cat (*F. catus*), but seems, like other domestic animals, to have come from the East. It is usually, though not indeed with absolute certainty, regarded as the descendant of the Egyptian Cat (*F. caligata* or *maniculata*), which was certainly domesticated in Egypt thirteen centuries B.C. That the taming should have taken place in the 'granary of the ancient world' is very natural. From Egypt the domestic cat spread through Europe, certainly before the Christian era, but at first sparsely, and confined to those who could afford a high price for the pet. It is quite possible that other species may have been domesticated elsewhere, and have mingled with the Egyptian breed. Rolleston and others have believed that the domestic mouse-killer of the ancient Greeks and Romans was not the cat at all, but the white-breasted Marten (*Mustela foina*), for which *felis* is good Latin.

In the middle ages cats were often kept in nunneries, and this may have something to do with their traditional association with old maids. Of its rarity in Britain in former times, when the wild cat was common in all the woods which

covered so much of the island, a curious evidence is afforded by a Welsh law quoted by Pennant—a law of the reign of Howel the Good, who died in 938 A.D.—fixing the prices of cats according to their age and qualities, beginning with a price for a kitten before it could see, and enacting that if any one stole or killed the cat that guarded the prince's granary, he was to forfeit a milch ewe, its fleece and lamb; or as much wheat as when poured on the body, suspended by its tail, the head touching the floor, would form a heap high enough to cover the tip of the tail.

Varieties.—The varieties of domestic cat, though numerous, are trivial, and mostly concern colour and quality of fur, not differences of form as in dogs. Thus we have (1) black cats with clear yellow eyes, usually with a few white hairs, and with hints of markings in the kittens; (2) white cats, sometimes with blue eyes, and then generally deaf; (3) tabby cats, like the wild species, and perhaps the result of crossing with the same; (4) gray cats, which are rare, and differ from the tabby forms in having no black stripes, except the common ones over the fore-legs; (5) tortoise-shell, fawn-coloured, and mottled with black, usually females; (6) sandy-coloured, usually males. A true tortoise-shell tom-cat fetches a big price. The royal Siamese cat is fawn-coloured, with blue eyes and small head; the Carthusian or blue cat has long dark grayish-blue fur, with black lips and soles; the Angora or Persian cat is large, finely furred, generally white, tending to yellow or gray, and possibly derived from an Asiatic species. The Malay cat, in Pegu, Siam, and Burma, has a tail only half the normal length; the Manx cat of the Isle of Man is tailless and has longer hind-legs. Long-tailed forms, probably due to intercrossing, also occur in Manxland, and curtailed forms occur in the Crimea. No cats with pendent ears exist, in spite of frequent statements to the contrary. In South America, not to mention other varieties, there is said to be a race of cats which do not 'caterwaul' at nights, and Professor Mivart justly remarks that 'it is to be wished that this breed could be introduced into this country.' Abnormalities, such as absent fore-limbs and the like, have been repeatedly recorded.

Characteristics.—The domestic cat is too well known to require description. It has been known to attain a weight of 23 lb., and an age of eighteen years. Though thoroughly domesticated, it retains many characteristics of wildness, especially in its private hunting expeditions, nocturnal amatory wanderings, unsocial habits, and generally self-centred, not entirely confident disposition. When turned out in the woods, it usually adapts itself readily. Domestication has had a different influence on cat and on dog, and the former may be fairly said to have surrendered itself less. In normal surroundings it is an expert hunter or stalker of birds and small mammals, and is often known to bring home rabbits; at the same time it has a marked predilection for food which it could not obtain if wild—e.g. milk, cheese, fish, and the like. Its sense of smell has probably degenerated, but is still very sensitive to certain favourite odours. The great dilatibility of the pupil enables it to make the most of feeble light. The cat is very prolific, mature by the end of her first year, fecund till the ninth, bringing forth often three or four times in a year. It is not necessary to say anything about its familiar purring, mewing, and spitting; about its aversion to water and love of warmth; its scrupulous and painstaking cleanliness; about its dexterous movements and patient watching for prey; or about the delight in cruelty (comparatively rare in other animals) which characterises its treatment of captured mice. The dry fur, free from any

oily matter and readily injured by water, becomes highly electric by friction, especially in dry or frosty weather.

Intelligence.—In cats the senses of sight, hearing, and touch are very highly developed, and the intelligence is proportionately great. That they exhibit great adroitness in catching their prey is well known, but the climax is reached in certain recorded cases where a young bird was used as a decoy for its parents, and where crumbs were scattered or scraped from beneath the snow to attract sparrows. That they bring zoological curiosities to their mistresses, that they may learn without teaching to 'beg' like dogs for food, that they show for a while considerable interest in the looking-glass problem are not unfamiliar facts, while more rarely they have been known to combine reasoning and manual dexterity in opening thumb-latches, working knockers, ringing bells, or even turning an easy lock. G. J. Romanes collected illustrations of the above, and closes his account with the remarkable case of a cat which, being accidentally ignited by paraffin, ran 100 yards and plunged into a trough of water. See his *Animal Intelligence* (1882).

Emotions.—The sexual emotions of cats are well known to be very strong, and their maternal kindness and solicitude are equally pronounced. From the time of Buffon, the cat has been usually reproached for liking places more than persons, but while there is much truth in the familiar observation, many cases of genuine fondness for owners are well known. They sometimes show great power of finding their way home under the impulse of home-sickness, and often show much careful love in concealing and transplanting their young. The case of a cat which ran for help for an endangered parrot friend, and of another which exhibited great solicitude about kittens—not its own—which had been accidentally buried under flooring, are at once suggestive and beautiful.

Diseases.—Besides being subject to common diseases like catarrh, diarrhoea, distemper, &c., cats are not unfrequently infested by parasites, either externally, as by the itch mite (*Sarcoptes cati*), causing swelling and baldness, and by fleas, or internally, by threadworms and tapeworms, and by the aberrant Pentastomum. Fits of vomiting are often due to small threadworms (*Ascaris mystax*) in the stomach, and *Ollulanus tricuspis*, another nematode, is even more important. The bladder-worms of mice and rats become the tapeworms of the cat.

Superstitions regarding Cats.—Cats have been objects of superstition from the earliest ages. In Egypt they were held in the highest reverence; temples were erected in their honour; sacrifices and devotions were offered to them; and it was customary for the family in whose house a cat died to shave their eyebrows. In the middle ages, they were regarded as the familiars of witches. The favourite shape of Satan was said to be that of a black cat, and the animal was an object of dread instead of veneration. There is or was a belief among sailors, that the frolics of a cat at sea portended a storm. Many people still prophesy rainy weather from a cat washing over its ears or simply its face; and a cat-call on the house-top was formerly held to signify death. Their assumed connection with witches, and the belief that a cat has nine lives, have led to the perpetration of great cruelties upon this harmless and very useful domestic animal (see Brand's *Popular Antiquities*, Ellis's revised edition).

Importance.—As a destroyer of vermin the cat is of no little economic importance, and the connection (through field-mice and humble-bees) between cats and clover crops is one of the stock

instances of far-reaching influence. The more cats the fewer field-mice is evident enough; but as the latter ravage humble-bee nests and combs, we may say, the more cats the more humble-bees; but as the bees carry the fertilising dust from one purple clover flower to another, and as this fertilisation is essential to the perfecting of the crop of seeds, we may read the complex relation again, as Darwin has pointed out, connect the two extremes in saying the more cats the larger purple clover crop. The fur and skin are utilised. Most people will allow, however, that, utility apart, cats justify their existence as domestic pets.

See Mivart's monograph, *The Cat* (1880), on which the present article is largely based; Champfleury's *Cats Past and Present* (trans. 1885); Mrs Chance's *Book of Cats* (1898); Miss F. Simpson's *Book of the Cat* (1903).

Catabolism. See FUNCTION, PHYSIOLOGY, PROTOPLASM.

Cataclysmal Action, a term applied by geologists to the effects or destructive power of sudden deluges or debacles, which were supposed by some writers to have swept over certain countries.

Catacombs are subterranean cemeteries consisting of galleries or passages, with recesses excavated in the sides for tombs, but also of chambers designed for purposes of religious celebration and assembly. These are found principally in the Italian peninsula, but also in Sicily, Malta, Sardinia, Melos, Russia, Egypt, Palestine, and Northern Africa. In all there is a broad correspondence in design, though considerable differences in plan and structure do arise. The catacombs at Rome reveal a complexity unparalleled elsewhere. North of the Alps there are no catacombs in the proper sense of the term, the so-called catacombs of Paris being merely abandoned quarries, used after 1787 as depositories for bones brought from old cemeteries of the city. The known catacombs date for the most part from the 3d and 4th centuries of the Christian era. Many are earlier, some later. Those within Italy are of earliest origin.

The etymology of the term is doubtful, being connected with the Greek *kata*, and with the late Latin *accubitorium* (a tomb), or the Greek *kumbē* (a hollow). The word does not appear before the end of the 3d century, and then not as the name of a cemetery, but as the topographical designation (*ad catacumbas*, or *catacumbas*) of a particular district on the *Via Appia* near Rome. Near this region lay the underground cemetery of St Sebastian, celebrated as the temporary resting-place of the bodies of St Peter and St Paul. In the process of time the term *catacumbas* came to be expressly associated with this cemetery, which was one of the very few which remained known and accessible after the 8th century. The fame of this cemetery as a place of religious pilgrimage led apparently in the 9th century to the name which was proper to it being used in a generic sense to denote all similar underground burying-places.

Jewish catacombs have within recent times been discovered in Rome; a Saracen catacomb is to be found near Taormina in Sicily; there are catacombs of Egypto-Grecian construction at Alexandria; but catacombs generally are essentially of Christian origin. They are the outward manifestation, indeed, of two early Christian conceptions, the first that in death the Christian should be separated from the pagan, the second that subterranean burial was the most specifically Christian form of interment. The first of these ideas was really of Jewish origin. It produced the Jewish catacombs of Rome. To the Christian, of course, persuaded of the essential kinship in death of the faithful, the idea of common burial necessarily appealed with special force. Subterranean burial, as apart

from cremation, did not originate, of course, with the early church. It had been usual for the Phœnicians so to dispose of their dead, and from them the custom passed to the Etruscans, and from them in turn to the Jews and the Romans. At Rome cremation merely succeeded 'the older and better custom of inhumation,' which it never entirely superseded, and which was re-established in the 4th century. The early church, however, did give to subterranean burial an especial sanction. There is reason, indeed, to suppose that it

Plan of the Catacomb of St Agnes, Rome.

definitely enforced it as a mode of burial. A naive conception of the doctrine of the resurrection was hardly reconcilable with cremation; subterranean burial was the custom of Judea, the cradle of the Christian religion; that form of burial had been hallowed by the example of the crucified Saviour, and was associated in him with hopes of resurrection. The position was, then, that Christians must be buried together, and that they must be buried subterraneously. The catacombs were the natural result. Their nuclei were the private sepulchres of the early Christians. These developed by degrees into great common burying-places, subject to the jurisdiction of the church.

Of all known catacombs, those of Rome are incomparably the most important. They are to be found at a distance of two to three miles from the Aurelian wall, the Roman law forbidding interment within the city. It was held for long that the catacombs of Rome were merely exhausted sand-pits, used by persecuted Christians for the burial of the martyrs—a Christian counterpart, indeed, of the burial-pits (*puticuli*, *puticulæ*) of Roman slaves. This idea, however, made necessary on the erroneous assumption that the catacombs were constructed in secret, has been completely discarded. In 1844 Marchi proved beyond all question that the catacombs of Rome were entirely of Christian construction, and from the first designed for places of sepulture.

They are excavated from the granular tufa, which is to be found almost everywhere in the neighbourhood of the city. This tufa—the second stratum from the surface—is too soft to be used for building purposes, but readily admits of excavation without any danger of collapse. As subterranean burying-places grew in number and importance a specialised class of excavators (*fossores*) arose, and came in course of time to form a sort of guild. Their craft was reckoned honourable, and they ranked as clergy of the lowest grade. The excavation of the underground cemeteries of Rome began with the construction of a stairway, which descended from the surface of the ground to a depth of some 30 or 40 feet, when

the granular tufa was reached. From this point diverged galleries (*ambulacra*), in height from 10 to 15 feet, and in breadth about 3. Side galleries branched off from these main galleries, intersecting other passages, and forming an intricate network of crossing and re-crossing corridors. These corridors were not merely passages of access to the subterranean cemetery. they constituted the

A Gallery with Tombs.

cemetery itself, the walls on both sides being pierced with tier above tier of horizontal recesses (*loculi*), the resting-places of the dead. To prevent the escape of putrefying gas—an important consideration where the cemeteries were to be used as places of assembly—these recesses were sealed by a marble slab, or by large tiles set in mortar, and on these epitaphs and inscriptions of various kind were written. For the wealthy and for the martyrs there were more imposing graves (*arcosolia*), where the body was placed in the space lying beneath a semicircular recess hollowed from the wall. In addition to the ordinary places of interment in the *ambulacra* the Roman catacombs contained a great number of sepulchral chambers (*cubicula*), each enshrining a larger or smaller number of dead. These were originally family burial-places, and from the date of their first construction served for the celebration of the eucharist and the agape on the occasion of the funeral and its anniversaries. Most of these *cubicula* were small, and incapable of containing more than a few worshippers. There were also, however, chambers of very much larger proportions, which were, undoubtedly, definitely constructed for purposes of religious assembly. The walls of all *cubicula* were coated with stucco, and richly decorated with religious paintings. The underground cemeteries of Rome were never confined to one level, but consisted almost always of various stories or *piani*, sometimes as many as five, and even on occasion seven, communicating by narrow flights of stairs, and by shafts and wells sunk for the admission of light and air. Many fables have been told of the extent of the catacombs of Rome. Forty cemeteries at least are known to have existed, and most of these were of considerable size. There is nothing, however, to support the idea that a perfect connection existed between all the cemeteries, making them to reach for many miles together. At the same time, it is perfectly certain that if the galleries could be extended in a straight line they would reach for some hundreds of miles. Estimates have varied

from 350 miles to 800 or 900. The number of graves is reckoned at six or seven millions by some, but at no more than two millions by others.

Tradition and documentary evidence have assigned several of the Roman catacombs to the first age of the church's history. For some an apostolic origin has been claimed. The earliest date vouchsafed is 72. Catacombs, however, were rare in the 1st and 2d centuries, and of small extent. It is not till the beginning of the 3d that the typical Christian subterranean cemetery appears. The existence of these early cemeteries was assuredly known to the powers at Rome. Their entrances, undisguised, face the public roads. Even though concealment had been desired, the nature of the work of construction would have rendered it impossible. But in any case the Roman law which sanctioned the slaughter of the Christians rigorously protected their tombs. From the year 65 to the middle of the 3d century there was no general religious persecution in Rome, and it is certain that during that period the Christians enjoyed peaceful occupation of the catacombs. During the next half-century, however, with its intervals of religious persecution, the case was altered. Though the extent of the public use of catacombs for purposes of worship and concealment during periods of persecution has undoubtedly been greatly exaggerated, it is too much to suppose that these underground cemeteries did not very frequently provide a safe retreat to harried bands of Christians. When used for such purposes, however, they naturally became liable to attack. Thus Christians were martyred as they celebrated in the tombs the holy mysteries, and in 253 a decree of Valerian forbade Christians 'to assemble in those places which they call cemeteries.' In the year following the edict was revoked, and the catacombs subsequently appear as enjoying good or evil fortune, according to the varying fortunes of the church itself. During the persecution of Diocletian in 303 they were altogether confiscated, though restored again to the bishop of Rome some little time thereafter. It is to these times of trial, before the final peace of the church under Constantine in 313, that one must trace those attempts to conceal the existence of the catacombs by structural alterations of various kinds. The same period also gave rise to an involved and enigmatic system of Christian epigraphy.

The recognition of the Christian faith by Constantine in no sense ended the custom of subterranean burial in Rome. From that time onwards, however, the practice gradually declined, partly, it would seem, because the localities suited to the purpose were exhausted, until, with the Gothic invasion of Rome under Alaric in 410, it altogether ceased. There was one exception. The second half of the 4th century witnessed a brief outburst of desire on the part of the faithful to secure places of burial as near as possible to the tombs of the saints and the martyrs. This outburst of desire reflects indirectly the new era which opened in the history of the catacombs when the ages of persecution had ceased. The catacombs at Rome then became not places of burial in the first instance, but centres rather of religious interest. Thus in the latter part of the 4th century Christians flocked to Rome from every land, and the crypt of every martyr of renown became a pilgrim shrine. To meet the requirements of pilgrims many structural alterations were made in the catacombs. It was during this period, too, that Constantine caused basilicas to be raised above the tombs of the principal martyrs, and that Pope Damasus sought to adorn the graves of the faithful with precious metals and with marble. This transformation of the catacombs into places of religious pilgrimage

made them, one must suppose, lucrative fields for spoliation; and though there is no direct evidence of the fact, the underground cemeteries of Rome were almost certainly sacked by the Goths in 410, and again in 457. Throughout this century, however, the restoration and decoration of the catacombs as places of religious interest was continued by successive pontiffs. But not so in the centuries following. From the 6th century onwards there is an almost complete decay of reverence for the catacombs. The ravages of the Goths under Vitiges in 537, the even greater havoc wrought by the Lombards in 756, and further spoliations by the Goths under Adolphus in 956, contributed largely to this result. The subterranean cemeteries of Rome were left to complete decay. Sheep and oxen invaded the shines, defiling them everywhere with unspeakable corruption. It was then that the spoliation of the catacombs by the hand of the church itself began. To prevent further desecration and destruction the bones of the martyrs and the relics of the saints were largely removed by successive popes to places of greater safety. With their removal the living history of the catacombs may be said to end. From time to time efforts were made by different popes to keep alive an interest in them, and when basilicas had been built over them some were still occasionally visited, but for the most part they were neglected and forgotten. When they next appear it is in the early 15th century, and then as objects of archaeological interest. It is really, however, to the 16th century that the rediscovery of the catacombs must be dated. A landslip at Rome in 1578 fortuitously revealed their presence. Since then the catacombs have been the subject of continuous archaeological study and research. Antonio Bosio, with his standard though incomplete work, published posthumously in 1632, was the pioneer. Later writers added little that was new till the appearance in the 19th century of Padre Marchi and Giovanni de Rossi, restorers both of the science of Christian archaeology.

The catacombs of Rome form without doubt the most notable monument of primitive Christianity which has come down to us. The inscriptions, frequently dated, give the name of the deceased (generally the cognomen), his relationship to the survivor, his rank and occupation. From such data it has been found possible to tell of the nature of the coming of Christianity, of the manner of its spread, of its influence on social and family relationship, and also of the early organisation of the church. These inscriptions, however, contain also expressions of pious aspiration, the hope of resurrection in especial. There is a total lack of the blank despair or impious defiance which mark so many pagan epitaphs. These expressions of hope, brief at first, such as *Pax tecum, Pax tibi, Vivas in Deo, Vivas cum Sanctis*, were in the 4th century developed at much greater length. In the 3d century, under the influence of persecution, they appeared in the form of Christian symbolism—the fish, the cross, the lamb and the dove, the anchor, the palm and the olive branch, all appear as symbolic of Christ, of sacrifice, of the soul, of hope, of victory over sin, of peace. All, inscriptions and symbols alike, constitute a record of the religious conceptions and dogma of the early church. In their varying tone, too, the inscriptions frequently reveal the manner in which the faith of the church became in time tinged with worldly influence. Paintings, representing, through the medium of Old and New Testament subjects, ideas similar to those expressed in the inscriptions (the hope of resurrection being again most prominent), are equally important as a record of early Christian faith and dogma. But they are of value also as frequently portraying

actual scenes of Christian worship. Not only so; in themselves they constitute a history of early Christian art from its beginning in paganism to its assumption of a definitely Christian character.

In the catacombs of Rome, however, is reflected not merely the religious but also the civil life of the first centuries. Thus the inscriptions of the tombstones, with their mention of physicians, bakers, smiths, joiners, &c., reveal what were the various employments of the time. Carvings of tools are not infrequently to be found, while very often that universal human instinct which causes the bereaved to lay by the departed some object which has lost its use through the death of the possessor has led to these tools themselves being actually deposited in the grave. The same instinct accounts also for the presence of many other objects—urns, money-jars, masks, dice, rugs, toys, &c.—all instructive of daily life in Rome. Of articles belonging to women there are very many—mirrors, combs, bodkins, pins, vinaigrettes, bracelets, amulets, ear-rings, necklaces, buckles, brooches, studs, seals, buttons, &c.

Outside Rome catacombs have been found at some twenty places in Italy. Those of Naples are undoubtedly the most important. These catacombs, unlike the underground cemeteries of Rome, were almost certainly in the first instance quarries. The nature of the soil from which they have been excavated has allowed of the construction of lofty corridors and spacious chambers to which there is nothing comparable at Rome. In other respects, however, in mode of interment, decoration, &c., there is no material point of contrast. The catacombs of Syracuse in Sicily are perhaps the most extensive outside the peninsula of Italy. Apart from one or two of minor importance, they are three in number, and form a great necropolis of several stories undermining nearly the whole of that portion of the ancient city which was known as Achradina. They date from the 3d and 4th centuries. In arrangement they differ widely from the catacombs at Rome. Thus the galleries and passages radiating from great circular halls do not proceed interminably or at random, but take upon themselves rather the definite form of Latin crosses. Conscious design is everywhere apparent, and the general mode of construction is more ambitious than at Rome. Though ravaged in turn by the Vandals, the Ostrogoths, and the Saracens, the catacombs of Syracuse have yielded in paintings and inscriptions valuable treasures to the archaeologist. Catacombs of lesser extent have been discovered in Sicily at Grazia di Carini, at Palermo, and near Girgenti. In the Saracen catacomb at Taormina the resting-places of the dead, contrary to the custom at Rome, run endwise into the walls of the *ambulatory*. The catacombs of Malta at Abbatiaad-Deyr and Tal-Liebru date from the 4th and 5th centuries. They are peculiarly irregular in construction. Their passages are very narrow, and have arched ceilings. Interments are here less numerous than in any other catacombs, and embellishments of every kind, whether in the form of inscriptions or paintings, are altogether lacking. The catacombs of Sardinia date from the 5th century. They are situated at San Antioco, and would seem to have developed out of a group of Punic tombs. In this respect they resemble the catacombs of Sicily. The catacombs of Melos are to be found at Trypiti, and date from the 4th century. In Crimea catacombs dating from the 5th century have been discovered at Kertch. The so-called catacombs of Kieff are the remains really of the cave-dwellings of early ascetics, who were buried as they lived, subterraneously. The catacombs of Egypt are at Alexandria. Some are of Christian, some of Egypto-Grecian, origin. The former are small, but

richly decorated with paintings. The latter are extensive, and distinct in design from anything at Rome or elsewhere. Their most outstanding feature is a remarkable regularity in construction. In all the catacombs of Alexandria the graves run perpendicularly to the subterranean corridors, as they do also at Saida (Sidon) in Palestine, where there are extensive catacombs. The catacombs of Northern Africa are to be found at Hadrumetum, near Sousse, and at Arch-Zara.

For the catacombs of Rome, see Bosio, *Roma Sotteranea* (1682); Marchi, *Monumenti delle arti cristiane primitive* (1844); De Rossi, *La Roma Sotteranea* (1864-77), and *Inscriptiones Christianae* (1857-61); Allard, *Les Catacombes de Rome* (1896); Marucchi, *Le Catacombe romane* (1903); Besnier, *Les Catacombes de Rome* (1908); in English, Northcote and Brownlow, *Roma Sotteranea* (1878-80), a condensation of De Rossi's work, and their *Epitaphs of the Catacombs* (1878); also Marriott, *The Testimony of the Catacombs* (1870); and B. Scott, *The Contents and Teaching of the Catacombs at Rome* (1919). For catacombs outside Rome, see Bellermand, *Über die ältesten christlichen Begräbnisstätten und besonders die Katacomben zu Neapel* (1839); Führer, *Forschungen zur Sicula sotteranea* (1897); Caruana, *Ancient Pagan Tombs and Christian Cemeteries in the Islands of Malta* (1898); Kulakovsky, *Materials for Russian Archaeology* (1896); Neroutsos Bey, *L'Ancienne Alexandrie*; Leynard, *Les Catacombes d'Hadrumète* (1904-5).

Catafalque (Ital. *catàfalco*, 'a scaffold'), a temporary structure of carpentry, a kind of baldachin, intended to represent a tomb, and placed over the coffin of distinguished persons during the funeral rites preceding interment, as also sometimes over the grave, where it was usually left for several months. The most splendid on record was Michelangelo's, which was adorned by the greatest architects, sculptors, and painters of the day. There were also portable catafalques for processions.

Catalan. See CATALONIA, PROVENÇAL, SPAIN.

Catalani, ANGELICA, an Italian singer, born in 1779 at Sinigaglia, near Ancona, was educated in the convent of Sta Lucia, near Rome, where, in her seventh year, strangers flocked from all quarters to hear her sing. Making her début at Venice in 1797, she experienced a succession of triumphs in every country in Europe for upwards of thirty years, making vast sums of money. The Italian Opera in Paris was twice under her direction; but her husband's interference and extravagance brought her into much trouble. Her large queenly person and fine countenance, the immense volume, range, and flexibility of her voice, her power of sustaining her notes, in contrast with the lightness and facility of her unerring execution, everywhere took her audience by storm. Her expression, although fine, and her whole style, surprised rather than touched the heart. She retired from the stage in 1827, and three years later purchased a villa near Florence, where she gave free instruction to girls who had a talent for singing. In 1849 she repaired with her daughters to Paris, where she died of cholera on the 13th of June.

Catalase. See FERMENTATION.

Catalaunian Plain, the ancient name of the plain surrounding Châlons-sur-Marne (q.v.), scene of the great battle in 451 A.D. between the Goths and the Huns. See ATTILA.

Catalepsy (*katalēpsis*, 'a taking possession of'), a state of more or less complete insensibility, with absence of the power of voluntary motion, and statue-like fixedness of the body and limbs in the attitude immediately preceding the attack, or in any position in which they may be placed by another person, for a considerable period, often until the return of consciousness. The attack may

last only a few minutes, or any longer period. The patient is usually in good health at the time of seizure, or subject only to nervous affections, such as Hysteria (q.v.); sometimes the attack is preceded by disappointment, fear, violent exciting or depressing passions, or religious emotions, being in such cases only an extreme form of what is otherwise called trance, reverie, or ecstasy; on other occasions the apparent cause is more purely physical, as in some of the hysterical cases. Patients rarely die during the attack, which may, however, be protracted for an indefinite period, and may even endanger life indirectly by the debility consequent on imperfect nourishment. The circulation and respiration are in most instances little affected; but cases have been recorded in which the patient has been supposed to be dead. Occasionally the same cataleptic rigidity of the muscles is present without any interference with consciousness. Many of the recorded cases of catalepsy are little worthy of credit, and it has even been doubted whether it can ever be said to exist exempt from some degree of deception, or at least voluntary and conscious regulation of the muscles. In epidemic catalepsy imitation must plainly have been at work. Moral means form a large part of the treatment, as in hysteria. In some cases it may become necessary to administer food by means of the stomach-pump.

Cataloguing of libraries is an art practised under various systems of rigid rules, such as those of the British Museum, the Bodleian, and the Library Association of the United Kingdom. Each entry may be made on a separate card, and the cards arranged in order; or the catalogue may be in book form. A card catalogue has the advantage of allowing indefinite expansion. The principle on which titles are arranged varies. In old catalogues books were often classified as folio, quarto, &c.—an arrangement with little to recommend it. For some purposes of library management a shelf catalogue is useful. For public use author and subject catalogues are best. In the former, titles appear under the authors' names in alphabetic order. In a subject catalogue they are grouped according to subject, either alphabetically or after some scheme of classification. Thus the Dewey system assigns to each subject a number of three or more figures, of which the first indicates one of the ten main groups, the second, one of its ten divisions, the third, one of the ten subdivisions.

Catalonia (Span. *Cataluña*), an old principality of Spain, triangular in shape, occupying the north-east portion of the peninsula, and now divided into the provinces of Barcelona, Tarragona, Lérida, and Gerona. Total area, 12,400 sq. m.; with a pop. of 2,400,000. Catalonia is the principal manufacturing province of the kingdom—'the Lancashire of Spain.' The language, costume, and habits of the inhabitants, who regard with contempt and pity the Spaniards of the surrounding provinces, are quite distinct from those of the rest of Spain, whose people they greatly surpass in energy, industry, and intelligence. They are honest, frugal, and enterprising; but this love of liberty has frequently developed a strong revolutionary spirit, and they are extremely passionate, revengeful, and egotistical. Even the educated classes speak the rough Catalan dialect, more nearly akin to Provençal than to Castilian, and dating back to the time when the province was part of the Frankish empire; for this and their literature, see SPAIN.

Catalonia, under the name of *Hispania Tarraconensis*, was considered, from its position, an important province of Roman Spain. It was invaded and captured by the Alani, who were followed by

the Goths, hence its name, *Gothalamia*, changed into Gothallunia or Catalonia. In the 8th century the Arabs gained possession of the southern part. When Charlemagne in 788 subjugated Spain as far as the Ebro, Catalonia formed the central portion of the Spanish mark; and in the beginning of the following century, when Louis the Pious of Aquitania had helped to finally drive the Arabs out, this division was restored, and broken up into fifteen counties, under Frankish lords. The counts of Barcelona, however, soon made themselves independent of France, and founded the principality of Barcelona. In 1137 Earl Ramon Berengar IV., by his marriage with the heiress of Aragon, united Catalonia with that kingdom; and the marriage of Ferdinand and Isabella united both with Castile. Thus Catalonia became an integral portion of the Spanish monarchy (1479), though never a very peaceable one. It has repeatedly taken a prominent share in Carlist and more recently in republican or anarchist insurrections. See histories of Catalonia by Balaguer (1885-87) and Bori y Fontestà (1898).

Catalpa, an interesting genus of hardy trees of the order Bignoniaceæ, of which two species are natives of the United States, and two others (decidedly distinct) of Japan. The genus was named by Catesby, probably from the Catawba River, where he first found them in 1726. The Common Catalpa (*C. bignonioides*) known also as the Bean-tree, Catawba, Indian Bean, and Cigar-tree, is a low and much-branched tree, seldom more than 30 or 40 feet high, extensively grown in the northern states and in southern Europe for ornament, but naturally found chiefly in the Gulf states. Its wood is light, soft, and not strong, but exceedingly durable. It is used for fence-posts, rails, and railway sleepers. Still more noteworthy is the Western Catalpa or Shawnee Wood (*C. speciosa*), which is a much larger and handsomer tree, now largely planted for ornament and in timber preserves. Its wood is soft, light, and durable, and is very useful, not only for the commoner and coarser purposes of the carpenter, but also for cabinetmakers' and joiners' use. *C. longissima* has been called Chêne des Antilles on account of the excellence of its timber. The bark is a source of tannin. The Japanese Catalpas are small and unimportant. The low habit, the profuse blossoms, and the long, cigar-like, pendent pods of the catalpas are easy marks of distinction from other trees.

Catalysis (Gr., 'dissolution') is a term applied in Chemical Physics to a force supposed to be exerted by one substance upon a second, whereby the latter is subjected to change or decomposition, whilst the former, or acting substance, remains comparatively unaltered, and does not combine with it. The force, indeed, has been ascribed to the mere 'action of contact.' Fermentation (q.v.) is an example of this force (see BEEB), when one part of yeast acting upon the sugar of the sweet worts, without entering into combination with it, compels 100 parts of sugar to pass into alcohol and carbonic acid. So also, when platinum or gold is brought in contact with peroxide of hydrogen, the latter is decomposed, while the metal remains unchanged. No final explanation has been brought forward to account for these changes, or to define what the force of catalysis is. The action is probably electrolytic.

Catamaran (a Tamil word) is a raft formed usually of three pieces of wood lashed together, the middle piece being longer than the others, and serving as a keel; on this the rower kneels or squats, and works a paddle. These simple vessels are used by the natives of Madras to maintain communication between ships and the shore, ordinary boats being rendered unsafe by the surf.

Larger catamarans, consisting of three logs of wood tapered at the end and lashed together, and carrying a sail, are used in South America. In the United States the name is applied to double boats, similar to the Ploa (q.v.) of the Ladrones. Some of these have been propelled by steam, but they have not proved successful. In the last quarter of the 19th century there was considerable development in the use of small double-hulled sailing-boats for racing purposes. Those in which the two hulls are rigidly connected are not satisfactory in rough weather, but in smooth water they are both fast and safe, and they are easily managed. The name catamaran is also applied, in the American navy, to a balsa, or framework supported by two floats, and to a float used in cleaning the side of a ship.

Catamarca, a western province of the Argentine Republic, sinking S.E. from the Andes to the Salt Marshes (Salinas Grandes). Almost two thirds of its surface is mountain or waterless desert, where the rivers are lost in the sands; but the remainder is very fertile, and yields much wine and corn, besides supporting large herds of cattle. Only copper has been much mined. Area, 40,000 sq. m.; pop. 100,000. —Catamarca, the capital, lies 82 miles N.E. of Rioja. Pop. 13,000.

Catamenia. See MENSTRUATION.

Catamount, a name for the Puma (q.v.), applied also, as is Catamountain, to other Felidae.

Catania, a city and seaport of Sicily, near the foot of Mount Etna, 59 miles by rail S.W. of Messina, and 54 N.W. of Syracuse. The fertile and well-cultivated plain of Catania, extending along the south-east base of Mount Etna, is styled 'the granary of Sicily,' and has given to Catania the title, 'La Bella Catania.' By eruptions of the great volcano and attendant earthquakes, the city has been several times almost entirely destroyed—especially in 1669 and 1693; but out of its ruins it has always risen with increased beauty, and it is now the finest city in Sicily, being built throughout on a beautiful and consistent plan, from which no deviation is allowed. The harbour of Catania, formerly good, was choked by a stream of lava in 1669, and is still unsafe, in spite of a mole constructed at great expense. Of several squares, the finest, in front of the cathedral, has a fountain with an ancient statue of a lava elephant bearing a granite obelisk. Among the chief buildings are the Benedictine convent of San Nicola, secularised in 1866; the cathedral, founded by Roger I. in 1091, and containing the relics of St Agatha; and the university, founded in 1445. Pop. of town (commune, 1911), 211,699; of province, 783,862. The Catanians are distinguished for their commercial spirit and industry. Catania has manufactures of silk and linen goods, and of articles in amber, lava, wood, &c. Among the remains of ancient times that earthquakes have spared, are those of a theatre, a temple of Ceres, Roman baths, and an aqueduct. The ancient *Catana* was founded by a Greek colony of Chalcidic origin, in the latter part of the 8th century B. C., and as early as the beginning of the 5th was esteemed one of the most flourishing towns in Sicily. It was taken by the Athenians under Nicias, and was desolated by Dionysius I.; but again rose under the Roman sway into its former importance. It suffered at the hands of the Goths, but once more, under the Byzantine empire, became one of the principal cities in the island.

Catanzaro, a city of South Italy, on a rocky hill 6 miles from the Gulf of Squillace, and 326 S.E. of Naples by rail. It has a cathedral, a ruined castle of Robert Guiscard, and a college. Catanzaro suffered very severely by an earthquake in 1783. It

his manufactures of silk, velvet, and woollen fabrics, and an active trade. Pop. 34,000. The province of Catanzaro has an area of 2000 sq. m., and a pop. of 484,600.

Cataplasm. See **POULTICE**.

Catapulta, an engine of war resembling the Ballista (q.v.), but used to discharge an arrow, not a stone.

Cataract, an opaque condition of the lens of the eye. It is readily distinguished from opacities of the cornea, or clear front part of the eye, by its position just behind the pupil—that round and varying aperture in the iris through which light is admitted into the back of the eye. Cataract may affect the lens alone (lenticular cataract), or the front or back of the capsule of the lens (capsular cataract), or both lens and capsule (capsulo-lenticular cataract). Its colour varies from pearly white to dark amber; but the lighter shades are much the most common. Heat will produce a like change on the lens out of the body, just as it changes white of egg from transparent to opaque. The rounded lens of the fish is seen at table in this opaque condition.

Cataract, especially in some of the forms which are present at birth or appear in infancy, may remain confined to one part of the lens; but in the vast majority of cases it gradually extends till the whole of the lens substance has become opaque. The most useful classification of cataracts is that according to the circumstances under which they develop; and the most important groups are *Congenital Cataract*, present at birth; *Diabetic Cataract*, caused by diabetes; *Traumatic Cataract*, the result of injury; *Senile Cataract*, coming on spontaneously after middle life (far the most common form); and *Secondary Cataract*, following some other disease of the eye.

Cataract is painless, and unaccompanied by inflammation. It occasions blindness simply by obstructing the passage of the light; but cataract alone does not produce such complete blindness that the patient cannot tell light, even faint light, from darkness. If an eye affected with cataract be unable to do this, it is certain that there is some serious disease in its deeper structures which would render the removal of the cataract quite useless for the restoration of vision.

With regard to the causes of cataract much is still uncertain. It is known that it results from injuries to the lens and from many serious diseases of other structures in the eye; that it is a common result of diabetes, and possibly of other constitutional diseases; that when it comes on without any such obvious cause the tendency to it is often hereditary, but rarely manifests itself before forty-five; and that after that age it becomes more and more common with advancing years. But what is the nature of the constitutional weakness or the structural defect which leads to its development has yet to be discovered.

No medical or other treatment yet known has any influence in arresting the progress of cataract, nor can it be cured but by a surgical operation. In cases where the cataract begins in the centre of the lens, some improvement of vision can be effected in the earlier stages by enlarging the pupil, and so allowing the rays of light to enter the eye through parts of the lens still transparent. This is some-

times done by the use of dark glasses, but usually by means of Belladonna or Atropia (q.v.) dropped into the eye. The latter method is often resorted to by quacks, who when they find their victims' sight improved by this means, promise a speedy disappearance of the cataract. The patient being able to see somewhat better, after long and increasing dimness of vision, begins to congratulate himself on a cure; the quack, of course, hastens to get his money without waiting for the further result, which is sure to be blank disappointment. So long as there is fair vision with one eye, the operation on the other may be delayed. It is a mistake to delay the operation in children on account of their tender age. The sooner it is done the better, both for the eye and the education of the child.

Till the middle of the 18th century the only recognised operation for cataract was *depression* or *couching*, a procedure by which the opaque lens was pushed downwards and backwards into the vitreous humour, leaving the pupil free. This method, though occasionally very successful, was often followed by severe inflammation and total loss of sight, and is now quite abandoned in favour, generally speaking, of *extraction*, and in certain cases of *discission*. The former is the common operation in elderly persons, the usual subjects of cataract, while the latter is often preferred in cases of softer cataract in younger persons. Some subsidiary operations, e.g. *needling* and *suction*, are performed in special circumstances.

Many methods of performing *extraction*, differing much in detail, have been practised. But all consist essentially of an incision at or near the margin of the cornea of sufficient length to permit of the removal of the entire lens, or at all events of its hard central nucleus. Most surgeons of the present day remove a portion of the iris (the coloured part of the eye), either at the same time or by a previous operation; and most tear the capsule of the lens and remove only its contents, though some extract the lens with its coverings. The performance of this operation has been much facilitated by the introduction of cocaine (see COCA) and other local anæsthetics, and by strict modern aseptic precautions. It now proves successful in skilful hands in considerably more than 90 per cent. of eyes where cataract is the only disease present.

In *discission* an appropriate needle is passed through the cornea; made to open and lacerate the front of the capsule, the rags of which curl out of the way behind the iris, so that their subsequent opacity does not obstruct the light; then the soft cataractous lens is punctured and torn up so as more effectually to admit the aqueous humour, which naturally fills the space between the lens and the cornea, and which has the remarkable property of absorbing or dissolving the lens or cataract when admitted within the capsule. This operation may require to be repeated more than once.

After the lens has been removed, it is never re-formed, and the refractive power of the eye is much diminished, while its accommodation is entirely lost. It is therefore necessary that a strong spectacle-glass be worn in order that clear sight may be obtained; and different glasses are required for distant and for near objects (reading, &c.). With such glasses, however, the perception of objects directly looked at is sometimes as clear as ever. See **EYE**.
